Call for Papers-AHRD 2000 xi
Conference Overview xiii
Conference Program xv

Proceedings

Town Forum

Certification of HRD Professionals, Products, and Academic Programs-The Role of AHRD 1
Human Resource Development Certification: 7

Sypmposium 1: Adult Learning in the workplace

The Relationship Between Workplace Learning and Employee Satisfaction in Small Businesses 15
Reframing the Andragogical Model of Adult Learning 20
A Holistic Model of Knowledge and Adult Learning 29
The Nature of Adult Workplace Curiosity 37

Symposium 2: Advances in Distance Learning

The Adoption of Computer Technology and Telecommunications: A Case Study 43
Distance Education: Examining Emerging Standards and Instructional Practice via Videotaped Content Analysis 52
Critical Components of Distance Education Partnerships between Two-year Colleges and Business and Industry 61
Comparative Analysis of Online vs. Face-to-Face Instruction 68

Symposium 3: Learning and Working in Groups

Collaborating in Public with the Opposition": A Study of the Complex Meaning of Learning in A Cross Boundary Work Group 77
Designing Dispute Management Systems 85
What's New in Teams 92
Application and Test of a Model of Team Effectiveness to Self-Managing 96

Symposium 4: Workplace Diversity Issues

Expanding Theories of Career Development: Adding the Voices of African American Women in the White Academy 104
The Role of Human Resource Development in the Successful Transition of Minority Youth into the Workplace 113
The Relationship Between Selected Variables on Diversity and the Implementation of Diversity as Successful Corporate Culture Change Programs 118
Diversity Practitioners—Learning From Experience! Defining the Role and Related Competencies in an Emerging Field of Practice. 125

Symposium 5: Learning Organization Issues

How Action Learning Builds the Learning Organization: A Conceptual Analysis 136
Enhancing Individual and Organizational Learning: A Sociological Model 143
Predictors of Learning Organizations: A Human Resource Development Practitioners Perspective 151
Action Learning and Systems-level Continuous Learning 159

Symposium 6: Managers and Learning

Expatriate Managers and HRD: The Missing Link 166
Managerial Practices to Facilitate Learning Within Learning Organizations 172
Operationalizing the Organizational Model of Managerial Employee Persistence 179
Critical Thinking, Developmental Learning, and Adaptive Flexibility in Organizational Leaders 187

Innovative Session 1:
Vital Work: Spirit and Development Within the Natural Workplace 193

Symposium 7: Linking HRD Theory and Practice
Reorienting the Theoretical Foundations of Human Resource Development: Building a Sustainable Profession and Society 202
Towards a Philosophical Framework for Thought and Practice 209
The Need for Theoretical Model Building in HRD 217
Bridging the Gap With a Multidimensional Performance Model 221

Symposium 8: Workforce Issues Facing HRD
Contributing Factors to the Success of Women and People of Color in Leadership Roles: 230
A Qualitative Assessment of Office Design Perceived by Older and Younger Workers to Impact Work 239
Consequences of Part-time Work for the Full-time Co-workers 247
Disability Disclosure, Recruitment Interviews, and the Employment Process 255

Symposium 9: Enhancing Employee Skills
The Effect Of Study Skills Training Intervention On United States Air Force Aeromedical Apprentices. 263
Helping Employees Develop Computer Skills While at Work: An Exploratory Study 272
Defining Core Problems for on the Job Training: An Example in the Car Repair Trade 282
How Can Firms Improve Sales Performance? 289

Symposium 10: Instructional Technology
Performance- and Learning Support With On-line Help Systems: An Effectiveness Study 292
Using Participatory Action Research to Investigate the Process of Designing and Developing Web-based Instruction (WBI) 298
Readiness of HRD Instructors to Engage in On-line Instruction 307
Motivating Community College Instructors to Teach On-line: An Exploration of Selected Motivators... 313

Symposium 11: International HRD Perspectives
Towards a Meaningful HRD Function in the Post-Command Economies of Central and Eastern Europe 318
The Impact of Human Resource Development on the Winter War Between Finland and the Soviet Union, 1939-1940 327
Designing Effective Training Program for International Transfer 331
Cross Cultural Effectiveness: A Case Study of Cultural Conflict Incidents 340

Symposium 12: Informal Workplace Learning
Re-conceptualizing Marsick and Watkins' Model of Informal and Incidental Learning in the Workplace 349
Creativity and Design 357
Contradictory Practices: Critical Feminist Perspectives on HRD and Workplace Learning 365
Self and Team Development in Practice (STP) Walk Rally 373

Symposium 13: Organization Structure and Strategy
Human Resource Development's Contribution to Strategic Service Quality Performance in Radisson Hotels Worldwide 380
Mastering Turbulent Growth: A Growth Audit at a Major Pharmaceutical Research Center 386
A Study of the Role of HRD in Response to External Environmental Change in Public Service Organizations. 396
Operationalizing Alignment: Testing Alignment Theory 401

Symposium 14: University HRD Programs
Case: Developing A Competency-Based Exam for an HRD Graduate Program 410
Scaling the Walls of Academic Silos: The Birth of a Cross-disciplinary Academic HRD Program 418
An Examination of Teaching Pedagogies in Entrepreneurial Education, a Historical Examination 427
Examination of Critical Issues for Development and Implementation of Online Instruction 434

Symposium 15: HRD Issues in Asia

The History of Human Resource Development in Taiwan from 1949 to 1999 443
Expatriate Development for the Asia-Pacific Region: A Comparative Analysis of Expatriates from Five Countries Across Three Continents 452
Development Of A Framework For Emerging Asian MNCs And A Model For Promising Local Enterprises To Migrate Onto The 'MNC Curve': An International HRD Perspective 465
The Framework and Practices of Cross-Cultural Training of Taiwanese Corporations 474

Symposium 16: Knowledge Management

Knowledge Management and Knowledge Dissemination 479
A Theory Of Knowledge Management 488
Signposts On The Road To Knowledge Management 496
The Relationship Between Human Resource Development And Business Strategy In 1998 Fortune 500 Companies 504

Symposium 17: Facilitating Organizational Change

Conflicts that Arise in Small Group Facilitation 512
A Test of a Rapid Developer Model 520
Barriers to Transformational Change 529
Pew Sitters or Church Pillars: A Case Study 536

Symposium 18: Evaluation in HRD

Assessing Organizational Readiness for Learning Through Evaluative Inquiry 542
Design and Development of an Evaluation System for Online Instruction 548
The Mixed-Method Evaluation in HRD--A Description of Methods Applied in the Industrial Development Program 554
The Effects of Two Training Systems on Trainee Satisfaction, Learning, Job Behavior, Retention and Organizational Performance 562

Symposium 19: New Perspectives in HRD

Developing an Instrument to Measure the Use of Play-Based Training Methods in Healthcare Education 569
An Approach to HRD Based on Acceptance of Responsibility, Dedication to Truth, Delaying Gratification, and Love: A Case for Kenyan Students 574
HRD and Economic Development: A Mega Level Research Agenda 582
Improving Technical Training: The Effectiveness of Technical Subject Matter Experts as Trainers 588

Symposium 20: Integrating Learning and Performance

Identifying the Skill Requirements and Performance Needs of Small Manufacturers 596
The Relationship of Learning and Performance Improvement at Different System Levels 602
Historical Antecedents Shaping The Terms Of Performance And Learning And Their Relationship In Human Resource Development: An Exploratory Study 611
Developing Managerial Competence: Does It Improve Performance? 620

Volume 2

Conference Overview

Symposium 21: Individual Learning Issues

A Quantitative Examination of the Feelings and Cognitive Processes of a Group of Adults Undertaking a Tertiary HRD Program 627
The Cycle of Awareness Development: A Cognitive and Psychosocial Theory of Adult Development .. 634
Components of Effective Business Based Diversity Training Programs 641
Personality Traits, Affect, and Values: A Model of Dispositional Effects 649

Symposium 22: Evaluating the Impact of HRD

Pre-Job Training and the Earnings of High-Tech Employees in Taiwan 658
Training Effectiveness And Employee Output - A Regression Model Based On Training Transfer And Organization Development Variables 665
Only Time Will Tell: Strengthening the Link Between HRD and Firm Performance 674
Contemporary Approaches to Return on Investment from Training 681

Symposium 23: HRD in the United Kingdom

HRD and Psychological Contracts: A Case Study of Lifelong Learning 689
Comparing International HRD Practices and Experiences With Cross-cultural Theories and Research: A Case Study of the Office for National Statistics 697
Management and Career Development in the UK in Practice 704
Information and Feedback Seeking in U.S. and British Human Resources Development and Training Settings 713

Symposium 24: HRD Professional Development

Mentoring as a Tool for Faculty Development: Predicting Positive Outcomes for Mentors 722
The Evolving Role of Trainers and the Consulting Component in Corporate Universities 730
A Corporate-University Partnership For The Development Of HRD Professionals: 739
Employed Adults in a B.S. Ed HRD Program Option: Who Are These Students and Why Are They Here? 747

Symposium 25: Changing Workplace

Women Entrepreneurs: Maintaining Business Success Through Human Resource Development 753
Evaluating the Impact of a Union-Management Career Development Program 762
The Superiority of Employee-Owned Companies: Reality or Myth? 770
Recruiting and Retaining Women in Business: Women Executives Maneuver To Change the Status Quo 777

Symposium 26: Measurement & Research Tools

Income Effects of Human Resource Development for Higher Educated Professionals 785
Do Higher Performing Managers Actually Receive Better Ratings? A Validation of Multirater Assessment Methodology 791
Examination of The Tendency of Coefficient Alpha to Support The Choice of Instruments With Response Category Restriction. 799
A Factor Analytic Investigation of the Content of Participant Reactions: Affective and Utility Judgments 806

Symposium 27: Workforce Development

Effects of Two Different Learning Paths on School-To-Work Transition 815
Predictors of Success in Welfare-to-Work Training for the Information Technology Workforce 826
Workforce Preparation in a Rural Context: A Curriculum Integration Intervention 831
Human Resource Related Characteristics in Selected Small Manufacturing Companies in Mexico 838

Symposium 28: Individual Differences in Learning
Creek Women's Perceptions of Work: A Qualitative Study 844
The Effect of Perceptual Learning Style and Self-efficacy on Preferred Instructional Method in an Advanced Technical Program: A Comparison of Computer Based Training and Lecture 851
Subordinates' Information Seeking Behavior: Empirical Investigation of the Effect of Perceived Leadership Style and Individual Differences 857
An Empirical Study of Age Discrimination in Teacher Selection With Application to HRD 865

Symposium 29: Linking HRD Practice and Research
Partnership Research: Ensuring More Useful HRD Collaborations 874
A Discussion of the Methodological Appropriateness of Research Represented in the AHRD Proceedings - A Strategic Perspective For Journey Management 880
Theory in "Theory to Practice": Voices of Practitioners 888
The Status of HRD Research Literature in 1997 897

Symposium 30: Contextual Learning Issues
Learning to Learn Strategies of Successful Real Estate Professionals: Implications for Learning in the Workplace 903
Vital Work: Spirit and Development Within the Natural Workplace 909
Action Learning as a Strategy for Inducing Psychological, Cultural, and Organizational Boundarylessness 918
Contextual Learning of Owner-Managers of Small, Successful Romanian Companies 927

Symposium 31: Career Issues in HRD
Are Careers What They Used To Be: A Factor Analysis Of Schein's Career Orientations Inventory 934
Women's Professional Organizations: Their Potential Role in Women's Careers 942
Non-profits and Women CEOs' Careers 951
Career Development of Expatriate Managers 958

Symposium 32: Assessing Employee Performance
Influence of Liking and Similarity on Multi-rater Proficiency Ratings of Managerial Competencies 966
A Cross-Case Study: Revisiting Implementations of the Performance Analysis for Training (PAT) Model 974
Large-Scale Training Needs Assessment of State Government Office Support Workers: 982
Results Assessment System: From Evaluation to Assessment 989

Symposium 33: Core Directions in HRD
Examination of Critical Issues for Development and Implementation of Online Instruction 997
The Relationship of Psychological Preferences and the Human Resource Development Role of Instructor/Facilitator 1006
HRD Competencies and Roles for 2000 1014
Ethical Aspects of Human Resource Development 1023

Symposium 34: Cultural Issues in Organizations
Emotion Management and Organizational Functions 1030
Communities in the Workplace 1038
Show Me the Money: Moderators of Satisfaction for University Administrators 1047
Questioning the Viability of a Women's Network as a Management Development Activity 1055

Symposium 35: Workplace Learning Issues
The Changing Role of Training Consultants in Organizing Work-related Learning 1061
Using Study Circles in the Workplace as an Educational Method of Facilitating Readjustment After a Traumatic Life Experience 1068
Learning-activities of Junior Managers: Findings of a Quantitative Pilot-study 1074
Integrating Learning with Working--A Reconception of the Role of Workplace Learning 1083

Symposium 36: Transfer of Learning
Learning Transfer in a Social Service Agency: Test of an Expectancy Model of Motivation 1092
The Relationship Between Learner Utility Reactions and Predictors of Learning Transfer 1100
Mixed Methods: The Value of the Qualitative Perspective in Transfer of Training Research 1108
Theories Supporting Transfer of Training 1116

Symposium 37: Change Processes in Organizations

The Role of the Survey in the Assessment of an Organization for High Performance Redesign 1124
Thriving on Change: An Organizational Identity Model 1131
Organizational Change and Transformation: A Multifaith Perspective 1140
Change in a State Government Organization 1148

Symposium 38: Qualitative Studies in HRD

What is it Like to be an Independent HRD Consultant? 1156
Virtual Learning Communities: Creating Meaning through Dialogue and Inquiry in Cyberspace 1165
Conducting Qualitative Multilingual Research in HRD 1174
An Ethnographic Study of Cross-Cultural Impacts on Tutoring in an Organization 1181

Symposium 39: Interpersonal Dynamics in the Workplace

Trust and Distrust at Work: Normative and Dyad-exchange Influences on Performance 1189
Work Culture Adjustment: A Critical Ingredient to Organizational Change 1198
The Moderating Effects of Individualism and Collectivism on HRD as an Instrument of Modernity 1203
HRD Faculty as Leaders: The Application of the Full Range Leadership Theory to Graduate Level HRD Instruction 1210

Poster Session

Two-way Customer Service Provider Cycle 1217
Using Art to Explore a Metaphor for the Training Process 1220

Author and Keyword Index 1225
AHRD Standards of Ethics and Integrity

From the Editor

Welcome to Arlington and the 1999 AHRD conference. Our profession and the Academy continue to grow, and the quality and quantity of the papers and presentations at this conference attest to this fact.

The work presented in these Proceedings, 161 papers from scholars in 12 countries, is among the most current research available in the field today. You will be stimulated by the scholarly debate and dialogue these papers create.

Enjoy the conference and the Proceedings. Please give us your feedback and ideas for improvement so that we can make next year's conference even better. Take a minute and review the following tips on using the proceedings.

Using the Proceedings

1. This year, the Proceedings are bound and printed in two Volumes. The papers in each volume follow the conference program. Volume 1 contains papers for the Town Forum and Symposia 1 through 20. Volume 2 contains papers for symposia 21 through 39.

2. The Table of Content at the beginning of each volume covers both volumes. So does the Index of Authors and Keywords at the end of Volume 2.

3. The Conference Program is included in Volume 1, a short overview appears in both volumes.

4. As in previous years, papers are identified by Symposium number. In addition, the Proceedings have continuous page numbers.

5. The CD contains the entire Proceedings document, as well as the 1998 Cutting Edge Top 10 Research Papers and the AHRD Membership Directory.

My sincere thanks to all the authors, Rich Torraco, and Kit Arnett for their help and cooperation over the past three months. A special thanks also to Tim Wentling for making the resources available to complete these Proceedings. Finally, thanks to R. Luke Evans for his expert editing help and to Betsy Kuchinke for the fine graphic design work.

Call for Papers

AHRD Research Conference 2000

Sheraton Imperial Hotel, Research Triangle Park, North Carolina

March 7 –12, 2000
Hosted by North Carolina State University

The Academy of HRD, an international organization having the mission of encouraging the systematic study of human resource development theories, processes, and practices, encourages you to submit proposals for the 2000 Annual Conference. All scholars interested in HRD are invited to submit proposals for consideration. The conference is attended by researchers and graduate students from the areas of HRD, business, psychology, education, economics, sociology, technology, and communication. In addition, HRD researchers and reflective practitioners from business, industry, and government participate fully in the conference.

Proposals may be submitted in three categories: Research and Theory Symposium, Innovative Session, and Poster. All proposals will be blind reviewed, and should be of new unpublished research. Papers accepted for the conference program will be published in the conference proceedings and may be published elsewhere following the conference. Authors may submit full manuscripts or proposals. Authors need to be aware that computers and projectors are not provided by the conference. Authors wishing to use computers and projectors must plan on providing them themselves

Proposal Requirements

Research and Theory Symposium

Full manuscripts (up to 20 pages) are strongly encouraged, but 5-6 page proposals are also accepted. Submissions should be new and unpublished. Research papers, as appropriate to the methodology used, should minimally contain the following elements:

1. Title
2. Problem statement
3. Theoretical framework
4. Research questions or propositions
5. Methodology and/or research design with limitations
6. Results and findings
7. Conclusions and recommendations
8. How this research contributes to new knowledge in HRD

AHRD also welcomes manuscripts presenting new scholarly theory, models, conceptual analyses, literature reviews, and case studies. While these papers may not yet offer results (#5 above) and conclusions (#6 above), they must otherwise follow the above requirements as closely as possible.

Proposal Requirements

Innovative Session

An innovative session is designed to present new and innovative HRD work through creative, interactive presentation formats that do not fit within the regular research and theory symposium process. Multiple papers will be considered, but one complete manuscript must be submitted for inclusion in the proceedings. Full manuscripts (up to 20 pages) are strongly encouraged, but 5-6 page proposals are also considered. The following criteria MUST be addressed and met in the proposal:

1. Title
2. Content of session with evidence that it is new, is innovative, addresses research or scholarship, and makes a substantive contribution to HRD knowledge
3. Description of format and style of presentation that is to be innovative, intellectually stimulating, generative of a high level of scholarly dialogue, and participative by both presenters and audience.
4. A timetable for how the 90-minute sessions will be filled.

Proposal Requirements

Posters

Posters are useful in presenting a theory or a model, though effective proposals have also been presented to use a variety of sessions to view the field of HRD in different ways. Posters are not a substitute for a scholarly paper. Posters will remain up throughout the conference, and a session will be scheduled to allow interaction between the author(s) and conference participants. The following criteria MUST be addressed and met in the proposal:

1. Title
2. No more than two, professional appearing, 2' x 3' poster boards that must be readable from a distance of six feet. Reduced copies of the poster boards should be included with the proposal.
3. An accompanying description of the poster that is not to exceed ten pages, which is to include the reduced copies of the posters. A 4-5 page proposal may also be submitted.
4. Reflective of a scholarly aspect of HRD.

Academy of Human Resource Development

Leading the Human Resource Development Profession through Research

P. O. Box 25113 225-334-1874 www.ahrd.org
Baton Rouge, LA 70894-5113 225-334-1875 Fax office@ahrd.org

Submission Requirements

Proposals/manuscripts must meet the following:

1. Double-spaced in 12-point font
2. Should not exceed the page limits specified, including figures and references. Manuscripts that exceed the page limits will be returned. Shorter proposals will be accepted.
3. Blind review ready
   A. Cover sheet with author(s) identification
   B. No author identification in body, header or footer of manuscript
   C. Cover sheet should contain full identification and contact information for ALL authors
4. All communication with authors will be via Email. Proposal/manuscript submissions MUST INCLUDE AN E-MAIL ADDRESS FOR ALL AUTHORS, if possible, but at least one author who will then receive all communications.
5. All deadlines are firm. Exceptions will be made only for true emergencies or extraordinary circumstances.
6. All final manuscripts not forwarded by Emaill must include a disk copy in MS Word 6.0 (or later) format.

Submission Deadlines

1. Proposals/Manuscripts: **October 1, 1999**

2. Decision notification: **November 16, 1999**

3. Final Papers due to editor: **January 3, 2000**

(Limited to 8 single-spaced pages except for posters which is limited to four, including the reduced copy or photograph of the posters.)

Submission Addresses

Submission by email attachment is strongly preferred. Do not send duplicate manuscripts. If an email submission does not go through, you will be given time to submit a faxed or mailed copy of the manuscript.

Academy of Human Resource Development

VISION

To Lead the Human Resource Development Profession through Research

MISSION

The Academy was formed to encourage systematic study of human resource development theories, processes, and practices, to disseminate information about HRD, to encourage the application of HRD research findings, and to provide opportunities for social interaction among individuals with scholarly and professional interests in HRD from multiple disciplines and from across the globe.

PUBLICATIONS

AHRD in cooperation with our publishing partners, provides a full range of scholarly and professional publications:

1. *Human Resource Development Quarterly*, our research and theory journal
2. *Human Resource Development International*, our new international journal
3. *Advances in Developing Human Resources*, a quarterly monograph series scheduled to begin publication in time for our 1999 Annual Conference
4. *Human Resource Development Research Handbook*, a book for both researchers and practitioners
5. Blind Refereed Annual Conference Proceedings published annually in conjunction with the annual research conference

MEMBERSHIP BENEFITS

AHRD membership includes the following:

1. a subscription to all three AHRD sponsored scholarly journals:
   - ★ *Human Resource Development Quarterly*
   - ★ *Human Resource Development International*
   - ★ *Advances in Developing Human Resources*
2. being a member of the only global organization dedicated to advancing the HRD profession through research
3. annual research conference with full proceedings of research papers (900+) pages
4. subscription to *the Forum*, the academy newsletter
5. subscription to the Academy Listserv, for timely professional and career information
6. research partnering, funding, and publishing opportunities

ANNUAL RESEARCH CONFERENCE

AHRD holds an annual research conference in the early spring of each year. The 2000 conference will be hosted by North Carolina State University in Raleigh-Durham, North Carolina, USA. Don Martin will chair the 2000 conference site committee.

AWARDS PROGRAM

AHRD recognizes professional excellence in the HRD profession through its awards program, including:

- ★ Richard A. Swanson Award for Outstanding *HRDQ* Manuscript
- ★ Malcolm S. Knowles Dissertation of the Year Award
- ★ AHRD Outstanding Academic Program
- ★ HRD Book of the Year Award
- ★ Outstanding Scholar of the Year Award
- ★ Outstanding Human Resource Development International Manuscript

Presidents

1993-1994	R. Wayne Pace, Brigham Young University
1994-1996	Karen E. Watkins, University of Georgia
1996-1998	Richard A. Swanson, University of Minnesota
1998-2000	Elwood F. Holton, III, Louisiana State University
2000-2002	Gary N. McLean, University of Minnesota

AHRD Annual Conferences

1993	Austin, Texas
1994	San Antonio, Texas
1995	St. Louis, Missouri
1996	Minneapolis, Minnesota
1997	Atlanta, Georgia
1998	Chicago, Illinois
1999	Arlington, Virginia
2000	Raleigh-Durham, North Carolina

Academy Awards

Outstanding Scholar Award

1994	Fred Otte, Georgia State University
1995	Ronald L. Jacobs, Ohio State University
1996	Victoria J. Marsick, Columbia University
1997	Gary N. Mclean, University of Minnesota
1998	Not Given

Outstanding Academic Program Award

1994	University of Minnesota, Minneapolis, Minnesota
1995	University of Twente, The Netherlands
1996	Not given
1997	Georgia State University, Atlanta, Georgia
1998	University of Illinois at Urbana/Champaign, Champaign, Illinois

Malcolm S. Knowles Dissertation Award

A Tribute To
Dr. Malcolm Shepherd Knowles, 1913-1997
by Tim Hatcher

Widely regarded as the father (and as he described himself later in his life, the grandfather) of Adult Education, Dr. Malcolm was also a most influential force in the early development of what we know today as HRD. He epitomized the concepts of learning and the development of people. His long and influential life was dedicated to learning, caring about people, and developing a better society through the community of adult learners. He sparked a new field of inquiry and challenged all of us to develop a new way of thinking about how both adults and children learn. For these and many other accomplishments he deserves recognition as one of the founding fathers of HRD. For his many accomplishments as well as his dedication to his students, the Malcolm S. Knowles Dissertation Award was inaugurated at the 1997 AHRD Annual Conference.

Malcolm S. Knowles Research Fund

AHRD has established a fund-raising effort in his name to support doctoral students in HRD. The fund has already received $1,000 in anonymous contributions and we are anxious to raise more. The funds will create an endowment, the earnings from which will be used to: (1) pay for the dissertation award, (2) offer grants to support dissertation research, and (3) offer travel support and a stipend to dissertation award winners.

WE NEED YOUR CONTRIBUTIONS

All contributions to AHRD are tax-deductible and can be sent to the AHRD office. Remember, all funds will be used to encourage high quality doctoral student research in HRD. *Our goal is to have at least $25,000 in the fund by the end of 1999 so we can offer our first grants in 2000.*

Please consider a contribution of any amount.

Knowles Dissertation Award Recipients

1996	*The Effect of a Perceived Leadership Style on Subordinates Information Seeking Behavior: A Transformational and Transaction Leadership Theories Perspective* Svjetlana Madzar, University of Minnesota
1997	*Managers as Facilitators of Learning in Learning Organizations* Andrea Ellinger, University of Georgia

Richard A. Swanson Research Excellence Award

Awarded for the best refereed manuscript published in *Human Resource Development Quarterly* for the Volume indicated.

Volume 1 1991	*QWL Improves Worksite Quality: Success Rates in a Large Pool of Studies* Robert T. Golembiewski, University of Georgia Ben-Chu Sun, National Cheng-Chi, Taiwan
Volume 2 1992	*Organizational Training and Signals of Importance: Linking Pretraining Perceptions to Intentions to Transfer* Timothy Baldwin, Indiana University Richard Magjuka, Indiana University
Volume 3 1993	*A Case Study in Forecasting the Financial Benefits of Unstructured and Structured On-the-Job Training* Ronald Jacobs, Ohio State University Michael Jones, Kenworth Truck Company Sue Neil, Paccar, Inc.
Volume 4 1994	*The Relationship Between Organizational Transfer Climate and Positive Transfer of Training* Janice Rouiller, ASTD Irwin Goldstein, University of Maryland
Volume 5 1995	*Augmenting Behavior-Modeling Training: Testing the Effects of Pre- and Post-Training Interventions* Jon Werner, University of South Carolina Ann O'Leary, Texas A&M University Timothy T. Baldwin, Indiana University Kenneth N. Wexley, Human Resources Decisions, Inc.
Volume 6 1996	*Managerial Behaviors and Workgoup Climate as Predictors of Employee Outcomes* Allan H. Church, W. Warner Burke and Associates
Volume 7 1997	*How Executive Women Learn Corporate Culture* Laura Bierema, Michigan State University

Outstanding HRD Book of the Year

1997	*Building the Learning Organization* Michael J. Marquardt George Washington University, Washington, DC
1998	*Corporate Creativity: How Innovation and Improvement Actually Happens* Alan G. Robinson, University of Massachusetts, Boston, MA Sam Stern, Oregon State University, Eugene, Oregon

WEDNESDAY, MARCH 3
Preconference Activities

8:30am to 5:00pm — **CONFERENCE CENTRAL AND REGISTRATION OPEN** — *Foyer*

12:00 to 5:00 — **PRECONFERENCE - Action Learning in the New Millenium** — *Cavalier B and Cavalier C*
International Federation for Action Learning (IFAL)
Chair: Judy O'Neil, Northeast Training Services, IFAL President

This preconference explores three learning strategies in research and practice of action learning: 1) individual learning; 2) organizational learning; 3) global human resource development. As a practitioner, scholar, researcher, or student, you can: 1) participate in discussions of the concepts of action learning and related learning strategies; 2) explore insights of critical issues to advance action learning in the new millennium through work in action learning groups

12:00 to 5:00 — **PRECONFERENCE - Performance through HRD** — *North1 North 2 North 3*
Chair: Reid A. Bates, Louisiana State University

One of our biggest concerns (in theory, practice, and research) in Human Resource Development and Performance Improvement is 'performance', how to define it, measure it, its implications for organizations, HRD/PI practice, and so on. The goal for this year's preconference is to take an ambitious look at issues related to valuing and assessing performance in organizations. A panel of experts from public and private sector organizations will participate in a round-table discussion to explore with pre-conference participants a number of issues critical to assessing and valuing performance in organizations.

12:00 to 5:00 — **PRECONFERENCE - Integrity through HRD** — *Cavalier A*
Chair: Neal Chalofsky, George Washington University

The 1999 conference will feature the 3rd annual integrity preconference entitled ***Integrity at Work: Bridging the Gap between Theory and Practice.*** *George Washington University's Forum for the Meaning of Work will focus on research governing the meaning of work and individuals' pursuit of fulfillment in the workplace. Our goal is to discuss the state of research in this area and the implications for practice, as well as for further research and theory building. We are inviting others who have been conducting research in this area, have ideas to contribute, or would like to participate in other ways.*

12:00 to 5:00 — **PRECONFERENCE - Issues in Global HRD** — *Concourse 1 and Concourse 2*
Co-Chair: Lex Dilworth, Virginia Commonwealth University
Co-Chair: Verna J. Willis, Georgia State University

This Second Annual Global HRD Preconference will take as its theme Issues In Global HRD. Drawing from issues obtained from four corporations, the preconference will establish a framework for understanding Global HRD. Subgroups will meet during a portion of the preconference around Global HRD Issue Clusters, so that individuals will be able to focus on issues of greatest importance to them.

THURSDAY, MARCH 4
Preconference Activities

7:00am to 8:00pm	**CONFERENCE CENTRAL, REGISTRATION AND EXHIBITS OPEN**	*Foyer*

FRIDAY, MARCH 5

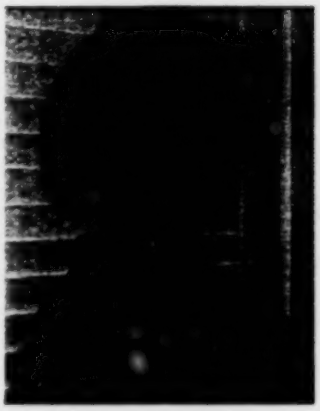
8:30 to 10:00 — South Ballroom

Keynote Presentation

Patricia A. McLagan, Chairman, McLagan International, Inc.

Many forces are changing the shape of work and learning in the world. Some are global and sociological, some technological, some intellectual, and some psychological. There are forces we have created as we've developed the HRD field. The very nature of work, the definition of "organization," the role of people and work continue to make dramatic tectonic shifts. Who is teacher? Who is learner? Who is manager?...and who the worker? How do HRD thought leaders and communicators prepare to be a future force while we - like the people we are supporting - navigate in the same blinding storm as they? What should we be doing? Learning? Creating as possibilities?

In this session, Pat McLagan will explore and discuss the implications of the above kinds of questions. If you can, prepare mentally by thinking about what your vision of the future for HRD- say, 10 years from now - is. What features would you like HRD to have? What legacy are you creating as we move into the next millenium?



Pat McLagan is Chairman of McLagan International, Inc. in the USA and South Africa. She is a graduate, Phi Beta Kappa, from the University of Minnesota with a BA in English Literature and an MA in Adult Education/minor Industrial Relations. She is a part-time professor at Rand Afrikaans University in South Africa, with responsibilities for a Masters Module in Human Resources Management and as an advisor on the overall program and strategy of the HRM faculty. She is a member of the Board of Governors of the American Society for Training and Development and is a former member of the Cabinet of the Minneapolis United Way and the Board of the Instructional Systems Association. She has been awarded the highest award given by the 30,000 member American Society for Training and Development, is the 15th member and the 2nd woman to be inducted into the International HRD Hall of Fame, and is a 1998 inductee into the International Adult and Continuing Education Hall of Fame

Moderator: ***Timothy G. Hatcher***
University of Louisville

10:00 to 10:15 — South Ballroom

Refreshment Break

BEST COPY AVAILABLE

10:15 - 11:45 AM - CONCURRENT SYMPOSIUM SESSIONS

1 **Adult Learning in the Workplace** *North 1*

Chair: Teresa Palmer, Illinois State University

1 - 1 Relationship Between Workplace Learning and Employee Satisfaction in Small Businesses
Robert W. Rowden, Mercer University
Shamsuddin Ahmad, Mercer University

1 - 2 Reframing the Andragogical Model of Adult Learning
Elwood F. Holton III, Louisiana State University
Richard A. Swanson, University of Minnesota

1 - 3 A Holistic Model of Knowledge and Adult Learning
Baiyin Yang, University of Idaho

1 - 4 The Nature of Adult Workplace Curiosity
Thomas G. Reio, Jr., University of Maryland

Innovative Session **Scholar-Practitioner's Perspective on the Application of HRD in the Workplace** *Cavalier C*

This session will provide different perspectives on the application of HRD in the workplace from five scholar-practitioners. Panelists who are members of the AHRD Global 100 will share their views on HRD research and practice. Each perspective will be an interactive conversation between the panelist and all those attending the session. An opportunity will be provided for networking among panelists and participants. This session is designed to generate a high level of participation and scholarly dialogue among all in attendance.

Panelists and Their Perspectives:

Marcia A. Marriott, Independent Consultant and University Professor

Gary L. May, Milbrook Distribution Services, Chief Learning Officer (CLO)

Joel Montgomery, Metalearning.com, LLC, Human Performance Consultant for a Global Consulting Firm

David J. Sisson, Airliance Materials, Llc, CEO of a Mid-sized Business

Nancy Snyder, Whirlpool Corporation, Human Resource Leadership Position at a Major International Corporation

Global 100

AHRD

Do You Know About the AHRD Global 100?

The AHRD Global 100 is a special group of HRD leaders who are reflective practitioners dedicated to linking their practice to HRD research and theory. By joining the AHRD Global 100, these members and their companies are making a public commitment to advancing the HRD profession through research.

Researchers: *Attend Innovative Session on Friday, 10:15 in Cavalier C to explore the scholar-practitioner view of AHRD's role*

Practitioner-scholars*: Want to help set the research agenda? Interact with leading thinkers in HRD? Partner with HRD researchers? Then join the AHRD Global 100.*

UUL 26

10:15 - 11:45 AM - CONCURRENT SYMPOSIUM SESSIONS

2 **Advances in Distance Learning** *North 3*

Chair: Martin Mulder, University of Twente, The Netherlands

2 - 1 The Adoption of Computer Technology and Telecommunications: A Case Study

Larry M. Dooley, Texas A&M University

Teri Metcalf, Texas A&M University

Ann Martinez, Texas A&M University

2 - 2 Distance Education: Examining Emerging Standards and Instructional Practice via Videotaped Content Analysis

Carmeta Tate-Blake, Florida International University

Jo D. Gallagher, Florida International University

Douglas H. Smith, Florida International University

2 - 3 Critical Components of Distance Education Partnerships between Two-year Colleges and Business and Industry

Edward Raspiller, Northern Illinois University

2 - 4 Comparative Analysis of Online vs. Face-to-Face Instruction

Scott D. Johnson, University of Illinois at Urbana/Champaign

12:00 - 1:30 PM - CONCURRENT SYMPOSIUM SESSIONS

Innovative Session

Beyond the Rhetoric: What Do We Really Mean by a Spirituality of Work — Cavalier A

This session will generate scholarly dialogue about the spirituality of work based on the following questions. What do we mean by a spirituality of work? Can a spiritual approach to work be made compatible with the profit motive that has become the dominant purpose of work life? Are we really experiencing change, a "new paradigm," in the underlying values and assumptions that affect work life, or is the spiritual rhetoric nothing more that one more "value-added" strategy to control, manipulate, or extract more from the worker? What role or place does spirituality have in the research and practice of HRD? How does it promise to shape or influence how we think about and what we do in HRD? Using the critical incident technique and group discussion, this session is designed to generate a high level of participation and scholarly dialogue about the spirituality of work among panelists and participants.

Panelists:

Jeri Darling, Darling Consulting

Terri A. Deems, Worklife Design

John M. Dirkx, Michigan State University

Krista Kurth, Renewal Resources, LLC

Fred M. Schied, Pennsylvania State University

Poster Session

New Models and Metaphors for Human Resource Development — Cavalier B

This session will present visual representations of new ideas and models in HRD. Using posters as the basis of scholarly dialogue, this session will engage participants in reflection, interpretation, and discussion of new models and metaphors for HRD. The presenters listed below will be present at this session to discuss their work and facilitate scholarly dialogue based on their posters.

Two-way Customer Service Provider Cycle

Harriet V. Lawrence, Management By Communication

American Society for Training and Development

 BEST COPY AVAILABLE

1:45 - 3:15 PM - CONCURRENT SYMPOSIUM SESSIONS

8 **Workforce Issues Facing HRD** *Cavalier B*

Chair: Kimberly McDonald, Indiana University-Purdue University

8 - 1 Contributing Factors to the Success of Women and People of Color in Leadership Roles: A Message to HRD Professionals

Jean McFarland, G P Morgan and Associates, Inc.

Gary Leske, University of Minnesota

Caroline V. Tur[illegible]r, University of Minnesota

8 - 2 A Qualitative Assessment of Office Design Perceived by Older and Younger Workers to Impact Work

Virginia Kupritz, University of Tennessee

8 - 3 Consequences of Part-time Work for the Full-time Coworkers: Procedural Fairness in Human Resources and Employee Reactions

Shannon L. Palmer, University of Maryland

8 - 4 Disability Disclosure, Recruitment Interviews, and the Employment Process

Tonette S. Rocco, Ohio State University

9 **Enhancing Employee Skills** *North 2*

Chair: Julie A. Furst-Bowe, University of Wisconsin-Stout

9 - 1 The Effect of Study Skills Training Intervention on United States Air Force Aeromedical Apprentices

John C. Griffith, U.S. Air Force

9 - 2 Helping Employees Develop Computer Skills While at Work: An Exploratory Story

Henriette M. Pranger, Quinebaug Valley Community Technical College

9 - 3 Defining Core Problems for on the Job Training: an Example from the Car Repair Trade

Simone Van Zolingen, University of Twente, The Netherlands

Jan Streumer, University of Twente, The Netherlands

9 - 4 How Can Firms Improve Sales Performance?

Camille M. Busette, AchieveGlobal, Inc.

10 **Instructional Technology** *North 1*

Chair: Scott D. Johnson, University of Illinois at Urbana/Champaign

10 - 1 Performance and Learning Support with On-Line Help Systems: An Effectiveness Study

Theo J. Bastiaens, Open University Netherlands

Jan N. Streumer, University of Twente, The Netherlands

Yvette Krul, Origin Human Performance Consulting

10 - 2 Using Participatory Action Research to Investigate the Process of Designing and Developing Web-Based Instruction (WBI)

Margaret L. Bailey, Northern Illinois University

Lorraine M. Hahn, Northern Illinois University

10 - 3 Readiness of HRD Professionals to Engage in Online Instruction

Chanidprapa Suriya, University of Illinois at Urbana/Champaign

Tim L. Wentling, University of Illinois at Urbana/Champaign

10 - 4 Motivating Community College Instructors to Teach On-line: An Exploration of Selected Motivators

James J. Kirk, Western Carolina University

Harold Shoemaker, Indiana State University

1:45 - 3:15 PM - CONCURRENT SYMPOSIUM SESSIONS

11 **International HRD Perspectives** *North 3*

Chair: AAhad M. Osman-Gani, Nanyang Technological University

11 - 1 Towards a Meaningful HRD Function in the Post-Command Economies of Central and Eastern Europe
Devi Jankowicz, University of Teesside, United Kingdom

11 - 2 The Impact of Human Resource Development on the Winter War between Finland and the Soviet Union in 1939-1940
John A. Niemi, Northern Illinois University
Ville Nurmi, Finnish Institute of Occupational Health

11 - 3 Designing Effective Training Programs for International Transfer
Doo H. Lim, Indiana State University

11 - 4 Cross-Cultural Effectiveness: A Case Study of Cultural Conflict Incidents
Carey C. Coghill, Coghill and Beery International

12 **Informal Workplace Learning** *Cavalier A*

Chair: Margaret Lohman, University of Iowa

12 - 1 Re-conceptualizing Marsick and Watkins' Model of Informal and Incidental Learning in the Workplace
Maria Cseh, Oakland University
Karen E. Watkins, University of Georgia
Victoria J. Marsick, Columbia University

12 - 2 Creativity and Design
Sharon J. Korth, Xavier University
Brenda S. Gardner, Xavier University

12 - 3 Contradictory Practices: Critical Feminist Perspectives on HRD and Workplace Learning
Sharon L. Howell, Pennsylvania State University
Vicki K. Carter, Pennsylvania State University
Fred M. Schied , Pennsylvania State University

12 - 4 Self and Team Development in Practice (STP) Walk Rally
Chiraprapha Tan Akaraborworn, University of Minnesota
Gary N. McLean, University of Minnesota

3:15 to 3:30 **Refreshment Break** *South Ballroom*

3:30 - 5:00 PM - CONCURRENT SYMPOSIUM SESSIONS

13 **Organization Structure and Strategy** *North 3*

Chair: Marijke T. Kehrhahn, University of Connecticut

13 - 1 Human Resource Development's Contribution to Strategic Service Quality Performance in Radisson Hotels Worldwide

Richard A. Swanson, University of Minnesota
Arthur V. Hill, University of Minnesota
Susan Geurs, Radisson Hotels Worldwide
Julie M. Hays, University of Minnesota
George John, University of Minnesota
David W. Johnson, University of Minnesota

13 - 2 Mastering Turbulent Growth: A Growth Audit at a Major Pharmaceutical Research Center

Michael Leimbach, Wilson Learning Corporation
Meredith Ceh, Wilson Learning Corporation

13 - 3 A Study of the Role of HRD in Response to External Environmental Change in Public Service Organizations

Kenneth R. Bartlett, University of Illinois at Urbana/Champaign

13 - 4 Operationalizing Alignment: Testing Alignment Theory

Steve W. Semler, Personnel Decisions, Inc.

14 **University HRD Programs** *North 2*

Chair: Rose Mary Wentling, University of Illinois at Urbana/Champaign

14 - 1 Developing A Competency-Based Exam for an HRD Graduate Program

Diane B. Ehrlich, Northeastern Illinois University

14 - 2 Scaling the Walls of Academic Silos: The Birth of a Cross-disciplinary Academic HRD Program

Ann K. Brooks, University of Texas-Austin
Kathleen Edwards, University of Texas-Austin
Alison Davis-Blake, University of Texas-Austin

14 - 3 An Examination of Teaching Pedagogies in Entrepreneurship Education: An Historical Examination

Ayman Tarabishy, George Washington University
Erik K. Winslow, George Washington University
George T. Solomon, George Washington University

14 - 4 Improving Post-Training Performance through Online Peer Learning and Distance Mentoring

Scott D. Johnson, University of Illinois at Urbana/Champaign
Tim L. Wentling, University of Illinois at Urbana/Champaign
Andrew J. Wadsworth, University of Illinois at Urbana/Champaign

3:30 - 5:00 PM - CONCURRENT SYMPOSIUM SESSIONS

15 **HRD Issues in Asia** *Cavalier B*

Chair: Valeria Stokes, Acco International, Inc., Global 100 Member

15 - 1 The History of Human Resource Development in Taiwan from 1949 to 1999

Christine M. Kuo, University of Minnesota

Gary N. McLean, University of Minnesota

15 - 2 Expatriate Development for the Asia-Pacific Region: A Comparative Analysis of Expatriates from Five Countries Across Three Continents

AAhad M. Osman-Gani, Nanyang Technological University, Singapore

15 - 3 Development of a Framework for Emerging Asian MNC and a Model for Promising Local Enterprises To Migrate onto the 'MNC Curve': An International HRD Prospective

Gerald Z. D. Huang, Nanyang Technological University, Singapore

15 - 4 The Framework and Practices of Cross-cultural Training in Taiwanese Corporations

Hsinyi Chen, National Dong Hwa University, Taiwan, R. O. C.

Menling Wu, National Central University, Taiwan, R. O. C.

Innovative Session **Action Learning in the New Millennium** *Cavalier C*

This session includes interactive segments on six different applications of action learning. Segment topics will include action learning as a global HRD strategy, the influence of the International Foundation for Action Learning (IFAL), action learning in corporate America, action learning as an individual learning and change strategy, outcomes of the 1999 Action Learning Pre-conference, and new directions for research on action learning. This session is designed to generate a high level of participation and scholarly dialogue among panelists and participants.

Panelists:

Laura L. Bierema, Michigan State University

Suzanne D. Butterfield, Georgia State University

Joel Montgomery, MetaLearning Com, LLC

Judy A. O'Neil, Partners for the Learning Organization, Inc.

16 **Knowledge Management** *North 1*

Chair: Gary L. May, Millbrook Distribution Services

16-1 Knowledge Management and Knowledge Dissemination

Wim J. Nijhof, University of Twente, The Netherlands

16-2 A Theory of Knowledge Management

Richard J. Torraco, University of Nebraska

16-3 Signposts on the Road to Knowledge Management

Allison Rossett, San Diego State University

James Marshall, San Diego State University

16-4 The Relationship between Human Resource Development and Business Strategy in 1998 Fortune 500 Companies

Erica D. Kalata, University of Illinois at Urbana/Champaign

Tim L. Wentling, University of Illinois at Urbana/Champaign

6:00pm **HRDQ Editorial Board Meeting and Dinner** *East 3*

6:00pm **AHRD Global 100 Meeting and Dinner** *TBA*

SATURDAY, MARCH 6

7:00am to 6:30pm — **CONFERENCE CENTRAL, REGISTRATION, AND EXHIBITS OPEN** — *Foyer*

7:00 to 8:15 — **Food 'n Thought Discussions** Pull up a chair to meet and dialogue with any one of these groups — *Concourse 1 and Concourse 2*

Discussion Group: Outsourcing HRD

Facilitator: *Darren Short, Office of National Statistics, United Kingdom*

Book Reviews: ***Effective Training Strategies,*** Jim and Adelaide Davis

50 Ways to Teach Your Learner, Ed Rose

Facilitators: *Adelaide Davis, University of Denver and Tom Shindell, Northeastern Illinois University*

Book Reviews: **How to Conduct Surveys** Arlene Fink and Jacqueline Kosecoff

Designing and Using Surveys, Janine Waclawski and Allan H. Church

Facilitators: *Debra Gutierrez, Oklahoma State University and Allan H. Church, W. Warner Burke and Associates, Inc.*

Breakfast Meeting - AHRD Global 100 — TBA

7:00 to 8:15 — **AHRD Foundation Board Meeting**

Chair: Rose Mary Wentling, University of Illinois — *East 3*

KEYNOTE PRESENTATION

South Ballroom

Standards on Ethics and Integrity for the Academy of Human Resource Development

Purpose: The purpose of this session is to introduce Academy members to a proposed set of Standards on Ethics and Integrity for the Academy of Human Resource Development. These Standards include sections on general principles, general standards, research and evaluation, advertising and other public statements, publication of work, privacy and confidentiality, teaching and facilitating, and resolution of ethical issues and violations. In addition to introducing these recently-developed Standards, the session will identify some ethical issues for members. It will include a panel presentation and allow for reactions from the audience. Thus, it provides a unique opportunity for Academy members to express their views on the Standards and to influence their future direction.

Structure and Process: This 90-minute session will be led by a panel of people who worked on the development of these Standards. During the first half hour, the panel members will provide details on the background of this effort, the process used for the development, an overview of the Standards, and one or two brief case studies using the Standards. During the second half hour of the session, a separate panel of selected Academy members will give their reactions to the Standards. During the final half hour of the session, members of the audience will be asked to discuss and react to the presentations. Since we want to encourage your participation, you may want to consider the following questions:

- In your work, what ethical issues have you faced?
- To what extent do these Standards address those issues?
- To what extent will such Standards help you in your work?

Panel Members:

★Janet Z. Burns, Georgia State University
★Peter Dean, University of Tennessee
★Timothy Hatcher, University of Louisville
★Fred L. Otte, Georgia State University
★Hallie Preskill, University of New Mexico
★Darlene Russ-Eft, AchieveGlobal, Inc.

Reaction Panel:

★Laurie Bassi, American Society of Training and Development
★Neal Chalofsky, George Washington University
★Elwood F. Holton, III, Louisiana State University
★Ronald L. Jacobs, Ohio State University
★Michael Leimbach, Wilson Learning Corporation
★Victoria J. Marsick, Columbia University
★Karen E. Watkins, University of Georgia

Please note: The full text of the ***Standards on Ethics and Integrity for the Academy of Human Resource Development*** is provided at the end of Volume 2 of the 1999 AHRD Conference Proceedings.

10:00 to 10:15

Refreshment Break

South Ballroom

10:15 - 11:45 AM - CONCURRENT SYMPOSIUM SESSIONS

17 **Facilitating Organizational Change** *Cavalier A*

Chair: Sharon J. Korth, Xavier University

17 - 1 Conflicts that Arise in Small Group Facilitation: A Descriptive Study of Accounts, Actions, Outcomes, and Assessments

Judith A. Kolb, Pennsylvania State University

William J. Rothwell, Pennsylvania State University

17 - 2 A Test of a Rapid Developer Model: Workplace Factors Associated with Learning and Development

James A. Alexander, AFSM International

17 - 3 Barriers to Transformation Change: High Performance Workplace Practices and Unionized Companies

Joseph A. Benkowski, University of Wisconsin-Stout

17 - 4 Pew Sitter or Church Pillar: A Case Study of a Non-Profit Organization's Need for A Director of Volunteer Development to Mobilize Its Volunteer Force

Patrice M. Scanlon, George Washington University

18 **Evaluation in Human Resource Development** *North 2*

Chair: Darlene Russ-Eft, AchieveGlobal, Inc.

18 - 1 Assessing Organizational Readiness for Learning through Evaluative Inquiry

Hallie Preskill, University of New Mexico

Rosalie T. Torres, Developmental Studies Center

18 - 2 Design and Development of an Evaluation System for Online Instruction

Tim L. Wentling, University of Illinois at Urbana/Champaign

Scott D. Johnson, University of Illinois at Urbana/Champaign

18 - 3 The Mixed-Method Evaluation in HRD--A Description of Methods Applied in the Industrial Development Program

Ville Nurmi, Finnish Institute of Occupational Health

18 - 4 The Effects of Two Training Systems on Trainee Satisfaction, Learning, Job Behavior, Retention and Organizational Performance

Maria Hruby-Moore, Ohio State University

19 **New Perspectives in Human Resource Development** *North 3*

Chair: Jean McFarland, G.P. Morgan and Associates, Inc.

19-1 Developing an Instrument to Measure the Use of Play-Based Training Methods in Healthcare Education

Rebecca J. Adams, University of Georgia

Karen E. Watkins, University of Georgia

Tom Valentine, University of Georgia

19-2 An Approach to HRD Based on Acceptance of Responsibility, Dedication to Truth, Delaying Gratification, and Love: A Case for Kenyan Students

Tabitha Sewe, Moi University, Kenya

19-3 HRD and Economic Development: A Mega Level Research Agenda

Suhail S. Zidan, Ohio State University

19-4 Improving Technical Training: The Effectiveness of Technical Subject Matter Experts as Trainers

Saundra Wall Williams, North Carolina State University

10:15 - 11:45 AM - CONCURRENT SYMPOSIUM SESSIONS

Integrating Learning and Performance — *North 1*

K. Peter Kuchinke, University of Illinois at Urbana/Champaign

20 - 1 Identifying the Skill Requirments and Performance Needs of Small Manufacturers

Julie A. Furst-Bowe, University of Wisconsin-Stout

20 - 2 The Relationship of Learning and Performance at Different System Levels

Richard J. Torraco, University of Nebraska

20 - 3 Historical Antecedents Shaping the Terms of Performance and Learning and their Relationship in Human Resource Development: An Exploratory Study

John A. Henschke, University of Missouri-St. Louis

20 - 4 Developing Managerial Competence: Does it Improve Performance?

Jonathan Winterton, Napier University, Edinburgh, United Kingdom

Ruth Winterton, Napier University, Edinburgh, United Kingdom

Innovative Session

Integrating New Technologies into a Human Resource Development Curriculum — *Cavalier C*

This session will provide an interactive forum for scholars and practitioners to discuss issues and concerns related to integrating new technology into HRD courses and using technology as a vehicle for delivering instruction. Issues for discussion will include the rationale for using technology, the benefits of using technology, the concerns, constraints, and limitations of using technology, recommendations for how to integrate technology into the HRD curriculum, and areas for additional research. This session is designed to generate a high level of participation and scholarly dialogue among panelists and participants.

Panelists:

Michael J. Davis, Manchester University, United Kingdom

Robert L. Dilworth, Virginia Commonwealth University

Larry M. Dooley, Texas A&M University

Diane B. Erhlich, Northeastern Illinois University

Tom Shindell, Northeastern Illinois University

Catherine M. Sleezer, Oklahoma State University

12:00 - 1:30 PM - CONCURRENT SYMPOSIUM SESSIONS

21 **Individual Learning Issues** *Cavalier A*

Chair: Timothy G. Hatcher, University of Louisville

21 - 1 A Quantitative Examination of the Feelings and Cognitive Processes of a Group of Adults Undertaking a Tertiary HRD Program

Bryan W. Smith, Edith Cowan University, Australia

21 - 2 The Cycle of Awareness Development: A Cognitive and Psychosocial Theory of Adult Development

Martin B. Kormanik, George Washington University

21 - 3 Components of Effective Business Based Diversity Training Programs

Rose Mary Wentling, University of Illinois at Urbana/Champaign

Nilda Palma-Rivas, University of Illinois at Urbana/Champaign

21 - 4 Personality Traits, Affect, and Values: A Model of Dispositional Effects on Motivation to Learn

Elwood F. Holton III, Louisiana State University

Sharon S. Naquin, Louisiana State University

22 **Evaluating the Impact of Human Resource Development** *North 1*

Chair: Tim L. Wentling, University of Illinois at Urbana/Champaign

22-1 Pre-Job Training and the Earnings of High-tech Employees in Taiwan

Tung-Chun Huang, National Central University, Taiwan

22-2 Training Effectiveness and Employee Output - A Regression Model Based on Training Transfer and Organization Development Variables

Constantine Kontoghiorghes, Oakland University

22-3 Only Time Will Tell: Strengthening the Link Between HRD and Firm Performance

Laurie J. Bassi, American Society for Training and Development

Mark E. Van Buren, American Society for Training and Development

22-4 Contemporary Approaches to Return On Investment from Training

Paul E. Brauchle, Illinois State University

William H. Koenecke, Illinois State University

23 **Human Resource Development in the United Kingdom** *North 2*

Roger F. Miller, University of Nottingham, United Kingdom

23 - 1 HRD and Psychological Contracts: A Case of Lifelong Learning

Graeme Martin, University of Abertay, Scotland

Judy Pate, University of Abertay, Scotland

Jim McGoldrick, University of Abertay, Scotland

23 - 2 Comparing international HRD practices with cross-cultural theories and research: A case study of the Office for National Statistics

Dana Bourland, University of Minnesota

Darren S. Short, Office of National Statistics, United Kingdom

23 - 3 Management and Career Development in the UK in Practice

Paul Iles, Liverpool John Moores University

23 - 4 Information and Feedback Seeking in U. S. and British Human Resources Development and Training Settings

K. Peter Kuchinke, University of Illinois at Urbana/Champaign

Darren S. Short, Office of National Statistics, United Kingdom

12:00 - 1:30 PM - CONCURRENT SYMPOSIUM SESSIONS

24 **HRD Professional Development** *North 3*

Chair: Maria Cseh, Oakland University

24-1 Mentoring as a Tool for Faculty Development: Predicting Positive Outcomes for Mentors

Ellen J. Mullen, Iowa State University

John Van Ast, , Iowa State University

Harry Grant, , University of California at Irving

24-2 The Evolving Role of Trainers and the Consulting Component in Corporate Universities

Ghazala Ovaice, University of Illinois at Urbana/Champaign

Tim L. Wentling, University of Illinois at Urbana/Champaign

24-3 A Corporate-University Partnership for the Development of HRD Professionals: A Case Study

Marijke T. Kehrhahn, University of Connecticut

Rudolfo Vernilli, The Hartford Life Company

24-4 Employed Adults in the B.S. ED Hrd Program Option: Who Are These Students and Why Are They Here?

Hui-Chin Chu, University of Arkansas

Ana Martinez, University of Arkansas

Barbara E. Hinton, University of Arkansas

25 **Changing Workplace** *Cavalier B*

Chair: Toni Powell, Barry University

25 - 1 Women Entrepreneurs: Maintaining Business Success Through Human Resource Development

Dominic G. Kamau, University of Minnesota

Gary N. McLean, , University of Minnesota

Alexander Ardishvili, University of Minnesota

25 - 2 Evaluating the Impact of a Union-Management Career Development Program

Gregory M. Chajnacki, Harleysville Group, Inc.

Andrea D. Ellinger, Pennsylvania State University

25 - 3 The Superiority of Employee Owned Companies: Reality or Myth?

Robert B. Gudgel, Work in Northeast Ohio Council

Fred C. Feitler, Kent State University

Karen Thomas, Kent State University

25 - 4 Recruiting and Retaining Women in Business: Women Executives Maneuver to Change the Status Quo

Laura L. Bierema, Michigan State University

1:45 - 3:15 PM - CONCURRENT SYMPOSIUM SESSIONS

26 **Measurement and Research Tools** *North 3*

Chair: Reid A. Bates, Louisiana State University

26 - 1 Income Effects of Human Resource Development for Higher Educated Professionals

Martin Mulder, University of Twente, The Netherlands

Bob Witziers, , University of Twente, The Netherlands

26 - 2 Do Higher Performing Managers Actually Receive Better Ratings? A Validation Of Multirater Assessment Methodology

Allan H. Church, W. Warner Burke and Associates, Inc.

26 - 3 Examination of the Tendency of Coefficent Alpha to Support the Choice of Instruments with Response Category Restriction

Shani D. Carter, University of Scranton

26 - 4 A Factor Analytic Investigation of the Content of Participant Reactions: Affective and Utility Judgments

Ronald B. Morgan, George Washington University

Wendy Casper, George Mason University

27 **Workforce Development** *Cavalier B*

Chair: Baiyin Yang, University of Idaho

27-1 Effects of two different learning paths on school-to-work transition

Esther Van Der School, University of Twente, The Netherlands

27-2 Predictors of Success in Welfare-to-Work Training for the Information Technology Workforce

Albert K. Wiswell, Virginia Polytechnic Institute and State University

Margaret G. McCrudden, Virginia Polytechnic Institute and State University

27-3 Workforce Preparation in a Rural Context: A Curriculum Integration Intervention

Gene L. Roth, Northern Illinois University

27-4 Human Resource Related Characteristics in Selected Small Manufacturing Companies in Mexico

William R. Venable, Oklahoma State University

Innovative Session **Performance Analysis--Analyzing Analysis** *Cavalier C*

This session will examine performance analysis, what it is, and what it ought to be. A case study from Motorola will illustrate the cost of not analyzing performance prior to taking action. While analysis involves finding certain predictable kinds of information, different performance requirements influence the nature of the studies. Why should a study to launch a new operating system be the same as what must be done to enhance performance appraisals or determine the development needs of professionals for the 21st century? An automated approach to performance analysis will be introduced that matches requests for assistance with performance-based responses. In addition, strategies for expediting the process of performance analysis will be discussed. This session is designed to generate a high level of participation and scholarly dialogue about performance analysis among panelists and participants.

Panelists:

Marguerite Foxon, Motorola

Allison Rossett, San Diego State University

Richard J. Torraco, University of Nebraska

1:45 - 3:15 PM - CONCURRENT SYMPOSIUM SESSIONS

28 **Individual Differences in Learning** North 2

Chair: Dennis G.Tesolowski, Clemson University

28-1 Creek Women's Perceptions of Work: A Qualitative Study
Barbara Bussell Kawulich, Georgia State University
Carol D. Hansen, Georgia State University

28-2 The Effect of Perceptual Learning Style and Self-efficacy on Preferred Instructional Methods in an Advanced Technical Program: A Comparison of Computer Based Training and Lecture
Daniel L. Parry, University of Louisville

28-3 Subordinates' Information Seeking Behavior: Empirical Investigation of the Effect of Perceived Leadership Style and Individual Differences
Svjetlana Madzar, Gustavus Adolphus College

28-4 An Empirical Study of Age Discrimination in Teacher Selection with Application to HRD
Jeffry S. Bowman, Ohio State University
Kiyoe Harada, Ohio State University

29 **Linking HRD Practice and Research** North 1

Chair: C. Ken Weidner, II, Loyola University Chicago

29 - 1 Partnership Research: Ensuring More Useful HRD Collaborations
Ronald L. Jacobs, Ohio State University

29 - 2 A Discussion of the Methodological Appropriateness of Research Represented in the AHRD Proceedings--A Strategic Perspective for Journey Management
Christopher R. Hardy, Innolog, Inc.

29 - 3 Theory in "Theory to Practice": Voices of Practitioners
Wendy E.A. Ruona, University of Minnesota

29 - 4 The Status of HRD Research Literature in 1997
Judy A. Hixon, Oklahoma State University
Timothy R. McClemon, People Architects, Inc.

Academy Discussion **A Continuing Discussion on Globalizing the Academy of Human Resource Development** Cavalier A

Facilitators: Victoria J. Marsick and Martha A. Gephart, Columbia University

The Academy invites members to join this discussion who have international global experience and are willing to participate in a multi-country, exploratory research process in the coming year around the meaning and processes of globalizing the Academy. Bring your ideas about the nature and focus for a research project of this kind. This interactive discussion will lead to a framework and action plan for the coming year."

3:15 to 3:30 **Refreshment Break** *South Ballroom*

3:30 - 5:00 PM - CONCURRENT SYMPOSIUM SESSIONS

30 **Contextual Learning Issues** *North 3*

Chair: Robert W. Rowden, Mercer University

30 - 1 Learning to Learn Strategies of Successful Real Estate Professionals: Implications for Learning in the Workplace

Margot Weinstein, Kingston Group, Inc.

30 - 2 Vital Work: Spirit and Development Within the Natural Workplace

Terri A. Deems, Worklife Design

30 - 3 Action Learning as a Strategy for Inducing Psychological, Cultural and Organizational Boundarylessness

Verna J. Willis, Georgia State University

Robert L. Dilworth, Virginia Commonwealth University

30 - 4 Contextual Learning of Owner-Managers of Small, Successful Romanian Companies

Maria Cseh, Oakland University

31 **Career Issues in HRD** *Cavalier B*

Chair: Larry M. Dooley, Texas A&M University

31-1 Are Careers What they Used to be: A Factor Analysis of Schein's Career Orientations Inventory

Gerri Murki, US Naval School of Health Science

Sharon J. Confessore, George Washington University

31-2 Women's Professional Organizations: Their Potential Role in Women's Careers

Shelia Barry-Oliver, George Washington University

Sharon J. Confessore, George Washington University

31-3 Non-profits and Women CEOs' Careers

Jenny Harrow, South Bank University, United Kingdom

Veronica Mole, South Bank University , United Kingdom

31-4 Career Development of Expatriate Managers: An International HRD Issue for Singapore-Based Companies

AAhad M. Osman-Gani, Nanyang Technological University, Singapore

Gerald Z. D. Huang, Nanyang Technological University, Singapore

32 **Assessing Employee Performance** *North 1*

Chair: Paul Brauchle, Illinois State University

32-1 Influence of Liking and Similarity on Multi-rater Proficiency Ratings of Managerial Competencies

Reid A. Bates, Louisiana State University

32-2 A Cross-Case Study: Revisiting Implementations of the Performance Analysis for Training (PAT) Model

Catherine M. Sleezer, Oklahoma State University

Dale E. Kunneman, Meridian Technology Center

32-3 Large-Scale Training Needs Assessment of State Government Office Support Workers: A Case Study

Donna H. Redmann, Louisiana State University

32-4 Results Assessment System: From Evaluation to Assessment

Richard A. Swanson, University of Minnesota

Elwood F. Holton III, Louisiana State University

3:30 - 5:00 PM - CONCURRENT SYMPOSIUM SESSIONS

33 **Core Directions in Human Resource Development** *North 2*

Chair: Ronald L. Jacobs, Ohio State University

33-1 Examination of Critical Issues for Development and Implementation of Online Instruction

Scott D. Johnson, University of Illinois at Urbana/Champaign

Nilda Palma-Rivas, University of Illinois at Urbana/Champaign

Chanidprapa Suriya, University of Illinois at Urbana/Champaign

Steve Downey, University of Illinois at Urbana/Champaign

33-2 The Relationship of Psychological Preferences and the Human Resource Development Role of Instructor/Facilitator: A Qualitative Analysis

Rafael Martinez, Barry University

Douglas H. Smith, Florida International University

33-3 HRD Competencies and Roles for 2000: A Study of the Perceptions of HRD Practitioners

Toni Powell, Barry University

Betty Hubschman, Barry University

33-4 Ethical Aspects of Human Resource Development

Jean Woodall, Kingston University, United Kingdom

Danielle Douglas, Phoenix Human Resources Consultants, United Kingdom

34 **Cultural Issues in Organizations** *Cavalier A*

Chair: Marie A. George, University of Scranton

34 - 1 Emotion Management and Organizational Functions: a Study of Action in a Not-for-profit Organization

Jamie Callahan Fabian, Virginia Polytechnic Institute and State University

34 - 2 Communities in the Workplace

Darlene Russ-Eft, AchieveGlobal, Inc.

34 - 3 Show Me the Money: Moderators of Satisfaction for University Administrators

Janine Waclawski, W. Warner Burke and Associates, Inc.

Allan H. Church, W. Warner Burke and Associates, Inc.

34 - 4 Questioning the Viability of a Women's Network as a Management Development Activity

Linda M. Hite, Indiana University - Purdue University

Kimberly S. McDonald, Indiana University - Purdue University

HRD and The Business: Turbulence, Turmoil and Strategic Direction

Rosemary Harrison, Durham University, United Kingdom

In its search for academic and professional identity, HRD still struggles for gravitas. Its business credentials are questioned when in many organizations the function is re-engineered, downsized, often outsourced. Its bottom-line contribution remains ambivalent, its strategic role uncertain. Yet in a world of increasing turbulence, HRD must overcome its own turmoil and strive for a powerful impact on organizational capabilities that are essential for business survival.

Despite the years of academic debate, however, those capabilities lack clear definition and an integrative conceptual base. Rosemary Harrison will introduce a new model of HRD in the business, with a framework that draws on her long experience in the field, on international case studies, and on her wide-ranging knowledge of the relevant literatures. Her work offers no panaceas for the turmoil of HRD, but seeks rather to open routes through some of HRD's more disputed organizational territory.

Rosemary Harrison is a leading HRD academic, professional, and author of many articles and best-selling texts (including *People and Organizations: Employee Development*, 1997) with international readership. She was Director of Durham University's (UK) HRD Research Center until retirement in 1996, and continues to conduct her research program there. She began her academic career at a leading UK polytechnic where she lectured in personnel management and organizational behavior. She taught extensively on postgraduate management and personnel programs, pioneering competency-based management education programs that achieved national recognition. In 1989 she joined the business school of one of Britain's ancient universities, Durham. There, she launched the School's first part-time MBA program, and directed an innovative Clinical Directors' management development program that won government funding and provided data for prize-winning academic papers. She has worked as consultant for many private and public-sector organizations and her public positions have included governor of a girls' independent school, non-executive director of a major NHS Trust, and specialist adviser for the British Council for National Academic Awards. In 1996 she was invited to become the Institute of Personnel and Development's Chief Examiner in Employee Development. The IPD is probably Europe's largest professional body, with membership nearing 100,000, and in that year had introduced national professional Standards to underpin its new qualification structure. In 1997 Harrison spearheaded the development of Standards in *Transition and Transformation of Organizations*, covering a field with which her address will be centrally concerned.

Certification of HRD Professionals, Products, and Academic Programs-The Role of AHRD

Michael Leimbach
Wilson Learning Corporation

As our profession grows, both in size and importance to organizational performance, we inevitably are confronted with the issue of industry-wide standards, and how to hold organizations and people accountable to those standards. Should the Academy of HRD be involved in establishing standards and certification in HRD? If so, how should the Academy be involved? The purpose of this paper is to help facilitate a dialogue on the role of AHRD in Certification. A description of certification is presented which suggests that there are several stages of certification. I then present arguments for why AHRD should be cautions, especially at the stages of certification that involve product evaluation and endorsement.

US organizations budgeted more that $58 billion for training in 1997 an expenditure that continues to rise, increasing 5 percent over the 1996 figure (Training, October 1997). Of this, over $13 billion was spent on purchased programs and services while approximately $22 billion was spent on employing HRD professional within their organizations. Organizations make this expenditure because they are aware of the importance of developing the talents and capabilities of their employees. Employees working together within an organization provide an important source of competitive advantage (Wimbiscus, 1995), some say the only source of competitive advantage (D'Aveni, 1994; Ehlen, 1995). In addition, because HRD is a growing industry an increasing number of students are choosing to enter the HRD profession, and choosing programs of higher learning to acquire the skills organizations need.

It is clear that some kind of information, or certification of quality could have a tremendous impact on our industry and profession. If certification of training programs, for example, could result in a small incremental improvement in the quality of purchases, corporations could save millions (e.g. a 2% improvement in purchasing decision making would translate into $20 Million). If information about programs could help students make better matches between their needs and the offering of an academic program, our profession would grow that much faster. And as new roles within HRD come into existence, information about the qualifications of potential employees will help organizations make better comparisons between the human resources and the activities and responsibilities across professionals.

Despite this need there is a dearth of third party information about quality within our industry. Organizations are provided with little unbiased information on the quality of the products they purchase (Passmore, Sleezer, Wise, and Passmore, 1993). Students rely on information distributed by the academic programs, or general rating of college-wide comparative quality. As our profession becomes increasingly important to sustained organizational growth and strategy implementation, the need for this information becomes more acutely felt. I believe that there is wide agreement that certification of professionals, products, and academic programs could be useful to the growth of our discipline and industry. Nor is it a question of whether AHRD has a role to play in assuring quality of human resource development professionals, programs, and products. I believe that the reason most of use are members or attend the conference is because we believe that AHRD is advancing our field. The question is not whether the Academy should be involved in certification. No other professional body is better prepared to address this issue. Rather, the central question is what is the most appropriate role for AHRD in the certification process.

The purpose of this paper is not to resolve this issue, but to describe why I believe that the Academy should move cautiously toward the issue of certification. I will begin with a description of certification, including a definition of the components and a description of some of the options for certification. I will then present some key reasons why AHRD should not, at this time, be directly involved in full certification. It would be a mistake for the Academy to take on certification at this time. While the intent of this discussion is to cover certification of professionals, products and academic program, trying to address all three at onces could be confusing. Therefore, I have framed most of my discussion on the topic most salient today, certification of HRD products. Human Resource Development is saturated with products. Some products are high quality and some are quick-fix, flavor-of-the-month, buzz-worded remnants of a slick sales job. These later products not only don't work, but also absorb HRD budgets and deplete the credibility of those delivering them. Without some form of certification the quality and utility of these products can only be determined after they are purchased and delivered. At this point, it is too late.

Copyright © 1999 Michael Leimbach

While my arguments are directed toward products, I believe they also apply to the other two domains – HRD professionals and academic programs.

What is Certification

To begin, we need to address the question, what is certification? The American Heritage Dictionary defines certification as the act of "confirming formally as true, accurate, or genuine. To guarantee as meeting a standard." In practice, however, individuals and organizations apply this term to a large number of activities and outputs. While there is no agreed upon use of the term "certification" most applications share one or more of the following elements: standards, data sharing, and endorsement. While not necessarily steps in a certification process, it can be useful to discuss certification as a three-step process leading to full certification/endorcement.

Defining Standards

The first step in development of any type of certification is the definition of the standards of certification. For HRD this is an important step as many current scholars agree that performance standards in our industry are poorly defined or non-existent (Holton, 1998) and the search for readily reportable measures of quality has been fraught with troubles (Edgman-Levitan, 1998). As a first step in certification, standards are a descriptive component, not evaluative. The purpose of setting standards is to define a set of characteristics, activities, or outcomes that individuals can use to compare and contrast different products. The standard is a descriptive statement of a desired state, not an evaluation of a specific instance and whether or not it meets the standard. Standards serve to describe the parameters of quality, not measure quality. Standards of quality can take many forms but are principally grouped into three types: technical, process, and utility/impact.

Some standards address technical characteristics. For example Underwriters Laboratories (UL) has standards for the design of electrical circuitry and grounding of home appliances. The US federal government has standards for radio and TV broadcasts. Technical standards address concrete, tangible characteristics of products. Within HRD there are some technical elements we can create standards for, but most are not very useful in describing the quality of products. For example, we could set standards on the presence of learning objectives in the materials, the types of learning activities, etc. However, because the vast majority of products meet these specifications, these standards would not help in differentiating products.

Process standards are standards focused on how a product is made. A good example of process standards are the standards behind ISO certification (ISO, 1991). ISO standards do not directly characterize the technical specifications of a product but defines quality standards for the processes used to develop and manufacture the product. Similarly HRD products are often evaluated relative to the extent to which they meet instructional design and development process.

Standards can also address utility or impact. If technical standards are equivalent to Demmings concept of "Conformance to specifications," utility standards might best be compared to Jurans "Fitness for use." The essence of utility standards is specification of the outcomes intended by the product. For example, one standard for HRD products could be that the product developer not make claims that can not be substantiated by factual documentation. Or, a standard that utility or impact of a product be substantiated by a study using accepted research methodology.

Standards are an essential first step, but alone they also can guide and advance the industry. For example, standards for TV broadcasting insure that all TVs can receive every broadcast signal. The value of a standard is largely determined by the credibility of the organization setting the standard and the voluntarily compliance of the industry to apply the standard.

Data Sharing

In our industry today, most unbiased information is provided through what Willenborg (1985) refers to as personal product knowledge. A buyer of a product bases choices on personal experience or inspection, or gathers opinions from colleagues. Similar processes are followed for students selecting an academic program. A more formalized form of data sharing occurs when an organization takes responsibility for collecting data, formatting it in a way that allows users to make comparisons, and distributes that data. Formalized data sharing assumes that some set of standards have been defined. While absolute standards are not required (e.g. "A two-ton truck should have a minimum of a 450 horsepower engine) there at least need to be clear categories of standards defined (e.g. all descriptions of two-ton trucks include horsepower ratings).

Data sharing can cover any and all of the standard types (technical, process, and utility). In addition, data sharing can also include information on consumer reactions to the product. Organizing and sharing data is, of course, a first step in certifying the quality of a product. However, it can stop short of actually certifying or endorsing a product. Probably one of the best current examples are the reader comments presented on amazon.com. Amazon.com, through their web sit, allows visitors to submit comments about books they have read. The reader also has the option of providing a rating (1 to 5 stars) of overall quality. Amazon.com does not filter or select these comments both good and bad reviews make it to the database. The site visitor is also aware of the limitations; comments represent personal opinions, the reviewer may have a personal bias or interest, and there is seldom enough data to make the ratings a reliable indicator of quality.

There is clearly a role for some organization to provide third party, or neutral, information on HRD products. While more involved than defining a set of standards, the Academy could get involved in communicating information on products as a neutral third party. This would not have to include evaluation, just reporting of information. Again, that reporting can take many forms. The academy can document technical characteristics, base upon technical standards described above. Information can also be provided on the documentation of utility or impact claims. For example, if an organization promotes a sales training program as "increasing sales" the Academy could provide information on whether or not the organization actually does have documentation that sales increased as a result of training. This falls short of certifying to the quality of that documentation (i.e. appropriately designed research, sufficient sample, statistically significant results, etc) just a reporting of the substantiation of the claim.

Alternatively, the Academy could serve as a "clearing house for consumer based information. Numerous list-serves do this now informally (we have all seen messages that being; "Has anyone used XYZ program and have on opinion on it?). A process could be designed similar to Amazon.com's consumer ratings/comments, using our web-site to collect and disseminate the information.

Endorsement

The final element is actual endorsement of quality. For many people the act of certification is synonymous with endorsement and it clearly closest to the dictionary definition. As a result of certification, certain products are given a "stamp of approval," and certain products are not. It is also a statement of warranty. A product certified by UL is a warranty that the product, under normal use, will not electrocute the user. Again, as in standards and providing information, different types of quality can be certified.

Technical quality can be certified. This is essentially what UL does, it examines products to assure that they meet appropriate standards for circuit design, grounding, and other specifications that warrant the safety of the product. It is important to note that UL, like most certifications, is narrow. UL does not certify that the toaster will make good toast, just that the toaster won't kill you. Within HRD the Academy could take on a certification to a set of technical standards. For example, do the programs contain appropriate instructional objects and do the activities follow adult instructional design parameters that will appropriately lead to those objectives.

Process quality can be certified. This is essentially the type of certification that ISO 9000 provides. ISO certification is not certification of the final quality of the product, but certifying that the organization engages in activities that will likely produce quality products. An analogy within HRD might be to certify the design and development and evaluation processes related to products. For example, can the vendor provide documentation that appropriate design analyses were performed, that learning objectives were appropriately developed, and that outcome claims were appropriately researched?

A third type of certification is outcome testing. Comparative product testing has been performed for decades. From whose french fries are the best to which laundry detergent gets clothes the brightest, the objective comparisons continue. Perhaps the most widely recognized example of this is Consumer Reports magazine. While much of what Consumer Reports provides might be best classified as data sharing, they also provide a direct comparison of product quality and make recommendations as to which products have the highest quality or are "best buys." Applied to HRD, an organization could take on the responsibility of doing direct product testing, or evaluate the tests done by others, and make recommendations, or certify to the utility of the product.

A fourth type of certification is customer satisfaction comparisons. Choosing this approach would make AHRD the J. D. Powers of the training and development industry. This goes beyond mere sharing of customer data (such as amazon.com) but implies a carefully controlled survey of customers that allow product to product comparisons. For example J. D. Powers uses sophisticated sample selection and analysis process that allow them to say that buyers of Mercedes and more satisfied than buyers of Lincolns (Reichheld, 1996). Thus, while not a direct measure or testing of product quality, different products can be compared via an unbiased sampling of users.

Problems with Certification

As stated earlier, I believe that there is strong support among Academy members for development of common standards. I also believe that AHRD should play a central role in this effort. I would also suggest that that the Academy might play a central role in providing unbiased information (sharing information) on adherence to quality standards. However, the question of certifying/endorcing products in our industry is fraught with dangers. Should the membership of the Academy not just communicate a set of standards in these three areas, but take responsibility for monitoring the degree to which these standards are met, and placing our "stamp of approval" on them? I believe there are several fundamental arguments why we should approach this effort with extreme caution. In this paper I will focus on the following:

- Talk of certification is pre-mature
- The important characteristics are largely qualitative in nature.
- The responsibility and liability is too high.
- Being the arbiter of certification is inconsistent with our mission of inclusion
- The certification process could consume the Academy
- Certification reinforces a static product orientation in the industry

Talk of Certification is Pre-mature

Certification comes after debate and the formation of consensus on a set of standards. Right now, there are no universally accepted standards for products in HRD. While I support an effort to define standards for HRD products, and believe that there might be a role for AHRD in sharing information about products, we are a long way away from being ready to commit to certification. We need to define these standards before moving on to certification. This also applies to standards for HRD professional and academic programs. While we have some standards in our industry, for example McLagan's Models for Excellence (1989) for training and development, none are specific to our industry as a whole.

Important Characteristics are Largely Qualitative

The important characteristics of products that will provide guidance to users are still largely qualitative in nature. Elements, such as the impact of a program on organizational or individual performance, are either qualitative, or where there are concrete measures, there is a subjective judgment as to the quality of the process used to collect those measures.

For example, take a sales training program. The concrete elements are things like length, presence of learning objectives, number of exercises, case studies, lectures, etc. While these are subject to little interpretation, they are also not very useful to a potential buying decision. So, we go deeper. The distributors of the program claim that the product "will improve the performance of a sales organization." How do we certify that claim? They don't say significantly improve or say "by 10%" so can we apply statistical criteria? Let's say they provide evidence in the form of a case study, showing that the sales organization did increase sales. What criteria do we use to say whether that is adequate or inadequate evidence of improvement? What if they presented 2 cases studies, or 5 or 10? What if they presented 10 cases studies, and showed the analysis that these 10 cases demonstrated statistical significance for sales improvement pre and post sales training? What if all 10 cases were computer companies and there were no controls for the rapid rise in computer equipment sales?

Ultimately it comes down to a judgment as to when the research evidence is sufficient to justify certifying a claim. Add to that the question of what we are certifying. Are certifying that the content of the program is supported by research (what do you do with NLP)? Are we certifying the instructional design? Or do we focus only on the result claims? We could chose to certify technical or process elements of products, but if we choose to certify to these, we will need to bridge that gap between certification and performance. What value is certification if the user does not believe there to be a connection between certification and performance? For example, is it widely accepted among practitioners that products with well-written instructional objectives are better than products lacking instructional objectives?

The Responsibility and Liability is Too High

Certification carries with it certain responsibilities and legal liabilities. How will vendors react to one of their products not being certified? Is the Academy ready to defend the process in court? Is there sufficient case law that will allow us to defend our certification process? These are all questions that need to be answered before we begin to certify products. Beyond the legal liabilities, what are the potential liabilities? Is there a conflict of interest, perceived or actual, within the Academy? Will member organizations be perceived to have an advantage in the certification process? Will academic programs whose faculty and students are members be perceived to have an advantage?

Certification is Inconsistent with Our Mission of Inclusion

We are an inclusive organization. What I value most in AHRD is the diversity of ideas and approaches. The process of certification is by definition exclusionary. One of the strengths of the Academy as an organization is the broad acceptance of approaches, research methodologies, disciplines and perspectives. Certification is one step toward an environment of exclusion. For example, if we choose as part of our certification process the requirement that claims of product impact use research methods consistent with the scientific method, will that ultimately lead professionals in our discipline who favor a phenomenological, case study, or qualitative methodology to leave the Academy. If we choose to accept more qualitative methods as evidence of impact, are we marginalizing the values of those who accept comparative scientific methods as the only true way to test hypotheses?

Certification Could Consume the Academy

Conducting certification will be a very big job. Does AHRD what to build the infrastructure to do this and will it consume the time and efforts of our governing board, to the detriment of other activities? Even if we just limit certification to products, and just to the US, there are still an overwhelming number of objects to certify. Add to that the fact that most products have numerous applications. The number of products and applications of those products is so vast, providing a fair and consistent certification may not be feasible for the Academy. Also, it will be difficult to determine conformity of two products to a common test. Rarely are two products so similar in purpose and intent that they permit easy/fair comparison.

Reinforcing a Static Product Orientation

Certification will need to define a unit of analysis. The one discussed most widely has been the product (a seminar, CD-ROM, guide, etc.). This is probably a necessary limitation of certification — it is difficult to certify multi-component systems. However, we as an industry are rapidly moving toward a systems perspective on HRD (Rummler & Brache, 1995). We treat as a given that the key to enhancing the effectiveness of learning is to see it as a process, with multiple components supporting learning application and transfer to the work environment. Using the example described above, we can certify the quality or impact of the sales training program. But doesn't certification of the program miss the point when a multi-dimensional effort that includes aligned compensation, application tools, incentives, management support (and yes, training), is much more consistent with our view of performance improvement? While a product is a feasible object of certification, the process – which resists precise description and certification – deserves our endorsement. If we certify programs, will we reinforce an orientation we know to be false? Will we "freeze" our vision of the industry to a standard that we know is limiting the impact of HRD today?

Is Certification Consistent with the Mission of AHRD?

It is my perspective, for the reasons cited about, that AHRD should not become involved in certification (i.e. endorsements) of HRD products. While the Academy should consider developing and disseminating standards for products, and creating a process to help buyers of products apply these standards in their selection of products; the Academy should not enter this arena as a certifying agency. Rather, I believe that the Academy must, first and foremost, uphold its mission to "lead the profession through research." We can honor this mission without taking on the burdens of liability, infrastructure, and uncertainty that certification entails.

Human Resource Development Certification: A Strategy for Leading the HRD Profession through Research

Catherine M. Sleezer
Oklahoma State University

Dale E. Kunneman
Meridian Technology Center

This paper presents a strategy to enact the Academy of Human Resource Development vision by developing and implementing certification. It identifies the critical needs for such certification and then examines how certification and consumer-report information from other fields can be applied to human resource development. The paper argues that currently individuals, organizations, and the profession pay high costs for substandard products, and that it is time to stop paying.

The vision for the Academy of Human Resource Development (AHRD) is to lead the human resource development (HRD) profession through research. In this paper, we present a strategy to enact the vision by developing and implementing certification for HRD products and programs. We answer two questions: "Why certify?" and "Is HRD certification feasible?" This article begins by outlining the critical need for HRD certification. We argue that certifying HRD products (e.g., conferences, workshops, customized interventions, and training materials) and HRD programs (e.g., academic and certification efforts) can provide some assurance that they do what they say they will do, and that they reflect accepted HRD theory and practice. Further, certifying HRD programs can assure that the professionals in our field have the skills and the knowledge of HRD theory and practice that they need to effectively perform their work. Because both HRD products and programs are considered by consumers to be HRD products that have costs and expected values, we use the term products in this paper to encompass both terms. After outlining the critical need, we examine the certification and consumer report information presented in the literature and describe its application to the HRD certification. We conclude by showing how HRD certification can benefit individuals, organizations, and the HRD profession.

Critical Need for HRD Certification

When employees working together within an organization produce rare or unique processes that are difficult for others to copy, they provide a source of sustainable competitive advantage (Barney, 1991). So, it is not surprising that organizational decision makers are investing increasingly in HRD interventions that purport to optimize the performance of individuals, teams, and the entire organization. Examples of such efforts include training employees, organizing high performance work teams and systems, implementing total quality management, and facilitating employee empowerment.

The investment in HRD products is staggering. U.S. organizations with 100 or more employees budgeted over $58.6 billion for training in 1997, a 5 percent increase over 1996 (Training, October, 1997). Outside expenditures comprised of seminars and conferences, hardware, off-the-shelf materials, outside services, and custom materials accounted for $13.6 billion, 23% of the total training budget. The 1999 American Society for Training and Development (ASTD) State of the Industry Report noted increases in many categories in 1998 including training expenditures, proportions of people trained, and use of external training providers (Bassi & Van Buren, 1999). The increased investment in HRD has led, in turn, to increased expectations for HRD accountability (Brinkerhoff, 1987; Swanson, 1994).

The increased investment in HRD and the corresponding increase in accountability highlight a problem: there is great variation in the effectiveness of HRD efforts. It has been estimated that 50% of HRD efforts are ineffective. Decision-makers who wish to purchase the most effective, least costly, research-based HRD products and services

Copyright © 1999 Sleezer and Kunneman

for their situation face a daunting task. To be successful, the decision makers must first access literature that is written in research-based jargon. The decision makers must also have the requisite time and expertise to review and synthesize the wealth of information available on the topic of interest (Bassi, 1998). So, it is not surprising that decision makers often fail to consult scholars (Bassi, 1998) and, instead, rely on vendor materials from mailings and conferences in making their purchasing decisions.

Basing HRD purchasing decisions on the endorsements contained in vendor brochures and catalogues or touted by vendors at professional conferences is problematic for several reasons. First, the proliferation of HRD products in the marketplace and the different names used for virtually identical offerings makes wading through all the options to comparison shop virtually impossible. Second, vendor materials may be biased, inaccurate, or misleading. Some HRD products offer high quality solutions, and others offer quick fix, faddish solutions. While the marketing materials for both types of products may look similar, the latter products are not integrated with the economic realities of the business, the current systems, or the psychological needs of the individuals within the organization (Evarts, 1998). The quick fix, faddish products often fail to make a lasting positive impact on organization performance. Such failures not only absorb organization resources, but also may leave organizations in a diminished competitive position (Sleezer, Zhang, Maile, & Gradous, in press). Third, vendors who obtain market and financial success with products have little motivation for seeking new research and product improvements, especially when if they can increase sales by doing more marketing. The predicament for decision makers is that the quality and utility of HRD products often cannot be determined until after they have been purchased and used and have produced a positive or negative impact on individuals, teams, and the organization.

In other arenas, well-educated consumers have found refuge in certification and consumer reporting processes that inform, educate, and protect the consumer. In arguing that the AHRD should develop and implement HRD certification, we should recognize that an organization with a vision of leading the HRD profession through research has an important role to play in informing, educating, and protecting HRD consumers. Such a role would assure that HRD professionals have the necessary knowledge, skills, and abilities to do their work and that HRD products and programs do what they say they will do and reflect accepted HRD theory and practice.

We also should consider carefully Swanson's (1997) assertion that some are profiting from the lack of standards in the field. "Maintaining the present substandard conditions is lucrative for profit providers of conferences and trade publications, publishers of books and media, circuit 'celebrities' and fad consultants" (p. 1-20). Can we as a professional association with our vision of leading the field through research tolerate such substandard conditions? The answer to this question reflects the values of AHRD members and informs the discussion about the importance of HRD certification.

Finally, we should acknowledge and celebrate that assuming the role of informing, educating, and protecting consumers will differentiate AHRD from the professional associations in our field that profit from hyping and marketing quick-fix, faddish solutions and products to their members and other consumers. We have answered the question about the importance of HRD certification, now we turn to the question of feasibility.

What is involved in Certification and Consumer Reporting?

In this section, we examine terminology and describe consumer organizations and aims. We also apply these concepts to the HRD profession.

Terminology

The term "certify" has been defined as "attesting as being true or as represented or as meeting a standard" (Webster's, 1977, p. 182). A certificate is a document that indicates that one has fulfilled the requirements and may practice in a field. From birth to death, certification for individuals and organizations is pervasive. Seldom do most of us even consider the alternatives. Riding in an uncertified elevator, flying with an uncertified pilot, or selecting a non-certified dentist or marriage counselor seem preposterous ideas. Is using un-certified HRD programs any less risky? Using certified professionals, products, and programs does not guarantee success; however, it does assure that certain standards have been met.

The concept of comparative product testing and consumer reporting are important to HRD certification. Comparative product testing can be defined as "determining if, and to what degree, relevant features are found to have constituent characteristics of a representative number of brands and types of a certain product" (Silberer, 1985, p. 2). Constituent characteristics are those characteristics commonly found in a specified product group. Because the results of compared products can be published and the prices of the products listed, the definition emphasizes the relationship between consumer and product. Comparative product testing has been performed for decades. From whose French fries are the best to which laundry detergent gets clothes the brightest, the comparisons continue.

The terms "certification," "consumer reporting," and "comparative product testing" emphasize determining product quality and communicating that information with consumers. Because the terms "quality" and "consumer" are key to our discussion, we turn next to those definitions.

Defining the Term "Quality"

The term quality has been defined and viewed in various ways. In this paper we present three views that are useful for discussing HRD certification. Quality as defined by the International Standards Organization (ISO) is "the totality of features and characteristics of a product or service that bear upon its ability to satisfy stated or implied needs" (International Standard ISO/IEC 9126, 1991). Technical quality is the extent to which a product meets the technical specifications for which it was designed. It is implied that the design satisfies the requirements and wishes of the consumer. Producers may restrict themselves to defining the consumer's wishes and needs without actually consulting the target group for the product (Melrose, 1996).

Quality of utility refers to the extent to which a product meets the requirements for use. The consumers' purposes can be derived from their needs and their uses for the product. In this perspective, the concept of consumers and their uses for a product are important in determining its quality.

Economic quality is the ratio between the utility of a product and its price. Consider the example of drinking the glass of water that is served free with a meal versus ordering a soda. The economic utility of water is greater than soda (assuming the desired benefit is to quench thirst and wash down food).

When comparing the three definitions, technical quality relies mostly on criteria established by the producer, whereas quality of utility relies mostly on criteria relevant to the consumer. Economic quality considers the quality of a product from the viewpoint of the consumer in terms of return on investment (Melrose, 1996).

Defining the Term "Consumer"

The consumer can be defined as the buyer, user or disposer of products or services (Kanis, 1988). Before a consumer makes the decision to purchase, he or she normally tries to assess various aspects of quality for the different brands, models and types of products or services offered. One type of assessment information consists of personal knowledge, experience or inspection of the product, or personal product information from fellow-consumers (Willenborg, 1985).

A second type of assessment information consists of commercial product information. In many cases, consumers do not have access to critical information concerning a product's characteristics, features, and functions. The product's producer or supplier is an external source of information. However, information from this source often is intended to simply promote and increase product sales. Needless to say, the information provided may be persuasive or incomplete. Moreover, the product information is seldom presented in a way that allows consumers to easily compare the information for different products (Willenborg, 1985).

A third type of assessment information consists of neutral product information. This information includes data about product characteristics that can be measured and that consumers consider when buying a product. Consumers can use product information to assess the quality of a product and to compare different product alternatives. They can also use the information to learn the correct ways of using a product (Willenborg, 1985). By comparison to commercial product information, neutral product information has an objective character and typically is supplied without any commercial purposes. Examples of this category of consumer information are the comparative product tests from consumer associations. As a result of consumer-oriented product testing, an extraordinarily high level of

voluntary industry commitments can be made to purchasers and consumers (Niedzielski, 1997).

In applying information from the certification and consumer testing literature to HRD certification, we recognize that the process would involve determining product quality and communicating it with consumers. The constituent characteristics of HRD products can be determined by using systematic processes that integrate theory and practice. Such systematic processes should begin by codifying an integrated theory of organizational performance and using it to develop and test HRD evaluation standards. The resulting evaluation standards may be used to certify the quality and usefulness of HRD products. The standards could serve as the foundation for providing neutral information to those who purchase and use HRD products. Moreover, the HRD evaluation standards could serve as drivers for change and performance improvement across organizations. The AHRD could update the standards and the certificate on a timely basis to reflect new knowledge. In this way, the HRD certification would provide an on-going driver for change and performance improvement within the profession.

Consumer Organizations: Aims and Activities

Recent decades have witnessed the rise of consumer organizations. This emancipation of the consumer has improved the position of the consumer through three distinctive avenues: 1) information, 2) education, and 3) protection. Most consumer organizations defend the free market system, and one of their most important activities is comparative product testing (Box, 1982).

Comparative product tests aim at providing objective and independent information (Silberer, 1985). The information is obtained independently of producers or suppliers and emphasizes the consumers' interests. Objectivity can be achieved by using general norms and standard procedures of measurement. Research is done either in-house or contracted to independent institutions. Often, consumer organizations show their objectivity by not including advertisements in their magazines and by stressing their independent and even critical attitude towards the industry (Jackel, 1989).

According to Kanis (1988), the most important object of research for consumer organizations is the technical and economic functionality of products. This is a measure of the satisfaction of needs. The functionality of a product results from the interaction of the product's specifications, its user, and its environment (Siderius, 1989).

The testing activities of consumer organizations encompass consumer-oriented and product-oriented research. Consumer-oriented research directly involves the consumer, mostly by means of interviews or questionnaires. Taste tests are an example of this kind of research. Product-oriented research is limited because the consumer is not involved in testing the product (Batsell & Wind, 1980).

Product characteristics generally fall into two categories: external and non-external characteristics. External characteristics can be established and evaluated by simply describing the product characteristics or making inquiries about their value. Non-external characteristics require a more extensive analysis. Typically, the evaluation of non-external characteristics is done through extended observation to determine durability, usability, and longevity of the product. Many comparative product tests focus on testing external characteristics. For example, a comparative test report for automobiles contrasts model reliability, product dimensions, and expense.

Consumer organizations produce data. In fact, comparative product testing often yields large quantities of data. Willenborg (1985) summarized the kinds of information that are often found in comparative product testing:

- Descriptive and evaluative information, which allows consumers to obtain insight about the market in a relatively risk-free and low-cost way.
- Presentation of brands, models, and types of one class of product at a certain point in time.
- Mass quantities of information (e.g., detailed description of characteristics, measurement results, comparative overall critiques of products and recommendations for "best buy").
- Limitation of sustained validity in the case of rapid model change and fluctuation of prices: typically retesting is necessary.

Regardless of the type of research used, published test results have two important functions: 1) presenting products and brands to consumers and 2) supplying comparative information on quality aspects of the products. They provide neutral product information to help consumers select products that fulfill their needs.

In applying this information to developing and implementing HRD certification, we should consider that the research could be done in-house by the AHRD, by a partner organization, or by contracting the work to independent institutions. Because many members of the AHRD are affiliated with universities and research institutions, identifying independent institutions capable of such research should not prove a difficult task. Evaluation standards that are based on an accepted theory of performance could be developed. Such standards could be applied systematically to assess the technical quality of HRD products, focusing on the external characteristics. Also, HRD consumers could be asked to provide feedback on HRD products as a means of assessing economic quality. The results could include certified products plus synthesized reports of information for consumers.

Measurement Issues

Clearly, measurement is at the heart of certification and consumer reporting. Before discussing how measurement issues can be addressed for HRD certification, we first overview the four critical measurement requirements for product testing as described by Siderius (1989). Most of these criteria are interrelated. All are necessary and none alone is sufficient.

First: Reliability.

In product testing, reliability is the degree to which repetition of the measurement produces the same or similar results. Reliability is contingent upon conformity and reproducibility. Conformity is the degree to which repetition of the measurement with different samples of a product (with identical characteristics) produces the same or similar results (product variation). Reproducibility is the degree to which repetition of the measurement on the same object produces the same or similar results.

Second: Validity.

In product testing, validity is the degree to which the measurement results reflect the functionality of a product as experienced by the consumer. Validity involves three primary considerations: internal validity, measurability, and interpretability. Internal validity is the degree to which the variables of use and the environment are included in the research conditions; measurability is the degree to which the product characteristics or functions of the product can be translated into measurable quantities; and interpretability is the degree to which the test results can be translated into different aspects of the functionality of the product. The reader should note that Siderius's description of validity focuses only on quality of utility and addresses neither technical or economic quality.

Third: Relevance.

In product testing, relevance is the degree to which the product information enables consumers to buy and use products that contribute to satisfying their needs. The products tested by consumer organizations many times are varied and random, but Siderius (1989) offers the following considerations for determining relevance:

- Importance of the product tested and its characteristics
- Degree of detail used in presenting the test results on the product's functionality
- Value judgment on certain product features relative to the product's functionality
- Availability of the product information
- Understandability or clarity of the available product information

Fourth: Feasibility.

In product testing, feasibility focuses on the amount of resources that have to be allocated to do the testing. For example, are the required methodologies at one's disposal?

To answer our earlier question about the feasibility of HRD certification, we should consider the measurement issues. Careful thought reveals that the measurement issues required for HRD certification (i.e., reliability, validity, relevance, and feasibility) are the same measurement issues that the AHRD community of scholars and scholarly-practitioners face in doing their normal work. The AHRD is uniquely positioned to assume the role of HRD certifier because its members include academicians and practitioners. Further, its members have a deep understanding of the measurement issues and respect for all HRD stakeholders. Its members also understand that, as with all efforts of HRD research and practice, no measurement system exists that is perfectly reliable, valid, relevant, and feasible. More importantly they believe that linking HRD research with practice is a way to make a difference and to produce improvements for individuals, groups, and organizations.

Benefits Of HRD Certification

AHRD certification will serve as a driver for performance improvements that benefit individuals, organizations, and the HRD profession. Earlier we discussed Swanson's (1997) assertion that some are benefiting from the substandard conditions that exist in the HRD field. Now is the time to ask, "Who pays? The answer is that we all pay. Organizations pay when decision-makers purchase substandard HRD products that do not improve organization performance. Individuals pay when they invest energy, commitment, and hope in substandard HRD products that do not produce the promised results. HRD professionals pay when the organizational members and decision- makers, who have previously paid the costs of substandard products, begin viewing HRD products as unnecessary expenses rather than investments in future performance. It is time for AHRD members to assert that the costs of substandard work are too high. We should stop paying.

AHRD certification of the programs that certify HRD professionals will drive individual change by assuring that individuals are knowledgeable and skillful in the theory and practice of HRD. It will drive organization change by motivating those who produce and sell HRD products to adapt their offerings to meet standards grounded in theory rather than in the latest fad. Vendors who can demonstrate that their products meet the HRD standards will benefit from a marketing advantage. Consumers of HRD products can use the certificate as one source in making purchasing decisions. HRD consumers and vendors both benefit from sharing more accurate understandings of organizational performance and theory and expectations for how HRD interventions contribute to it. The HRD profession benefits from the credibility that results when research informs practice and practice inform research.

Conclusion

In this paper, we argue that HRD certification provides the AHRD with a strategy for leading the HRD profession through research. We answered the question, "Why certify?" by referencing the AHRD values, the size of the HRD investment, and the problems caused by the lack of HRD certification. We answered the question, "Is certification feasible?" by examining product testing and consumer reporting in other arenas, clarifying the measurement issues, and recognizing that the measurement issues for certification are similar to those that the AHRD community of scholars and scholarly-practitioners routinely face in doing their normal work. By developing and implementing HRD certification for professionals, products, and programs, the AHRD can enact its vision of leading the HRD profession through research. Further, the AHRD can provide a service that benefits individuals, organizations, and the entire profession. Given the enormous benefits to be gained, the feasibility of certification, and the AHRD values, we believe that *now* is the time to develop and implement HRD certification.

The Relationship Between Workplace Learning and Employee Satisfaction in Small Businesses

Robert W. Rowden
Mercer University

Shamsuddin Ahmad
Universiti Putra Malaysia

Studies of HRD tend to focus on large firms even though small businesses constitute 98 percent of U.S. firms. Recent studies have found evidence of extensive HRD in small businesses. Other recent studies found a higher level of job satisfaction among employees of small firms than employees of larger firms did. This study measured the nature and extent of HRD; the level of job satisfaction among workers; and determined the correlation between HRD activities and job satisfaction in small to mid-sized businesses. The study is also looking at cross-country comparisons with Malaysia.

Keywords: Workplace Learning, Job Satisfaction, Small Businesses

For businesses in the United States to remain competitive in an increasingly global economy, some are calling for drastic measures to be taken with regard to training and developing the workforce. Business and government leaders continually lament the lack of motivation, education, and job skills of the U.S. workforce yet offer few concrete suggestions about how to remedy the problem. For the most part, business and industry has acknowledged at least partial responsibility for training and educating the workforce. In fact, it is estimated that $60.7 billion (USD) a year is spent on training (Training Industry Report, 1998).

Firms in all parts of the world invest heavily in human capital. For example, U. S. firms invest, on average, $1,800 (USD) per year per employee in training and development. British firms invest approximately $5,000 (USD) annually per employee and Germany invests an average of $7,500 (USD) annually per employee. Furthermore, estimates suggest that about 8 percent of new employees receive formal training in their first year of employment in U. S. firms and 20 percent of new employees receive such training in European firms, and 74 percent receive such training in Japanese firms (Hitt, 1998).

Developing the human resources of a company would seem to be key to increasing production and closing the gap between the level of worker skill and present and future needs. Businesses that have made training, education, and development a priority have seen it pay off through greater profitability and increased worker satisfaction (Coblentz, 1988; Filipczak, 1989). Recent studies have found that worker satisfaction is rarely tied to pay and promotion; but rather, workers are more interested in such things as feeling appreciated, being "in on things," and career development (Buhler, 1994; Dolan, 1996) all of which have linkages to workplace learning.

Job satisfaction is simply how people feel about their jobs and different aspects of their jobs. There are important reasons why organizations should be concerned with job satisfaction, which can be classified according to the focus on the employee or the organization. First, the humanitarian perspective is that people deserve to be treated fairly and with respect. Job satisfaction is to some extent a reflection of good treatment. It also can be consider an indicator of emotional well being or psychological health (Haccoun & Jeanrie, 1995). Second, the utilitarian perspective is that job satisfaction can lead to behavior by employees that affects organizational functioning, as well as a reflection on organizational functioning. Differences among organizational units in job satisfaction can be diagnostic of potential trouble spots (Beatty, 1996). Each reason is sufficient to justify concern with job satisfaction. Combined they explain and justify the attention that is paid to this important variable.

Indeed, Buhler (1994) emphasizes the point when she talks about the continued effort organizations must place on employee satisfaction and the economic importance to the company. "Organizations that believe that workers are easily replaced and do not invest in their workers send a dangerous message. This often results in high turnover, which is accompanied by high training costs, as well as hiring costs. . . .it fosters the same type of attitude in the employee, that the company can be replaced and little loyalty is felt" (1994, p. 10). These studies make it clear that companies must take advantage of all workplace learning opportunities if they are to remain successful.

Copyright © 1999 Robert W. Rowden

However, until recently, most studies of this nature have been conducted in large corporations. Few firms in the samples have had annual sales of less than $1 billion (USD). However, most U.S. businesses are small to mid-sized with annual sales well under $10 million (USD) (Lee, 1991).

Small businesses are playing an increasingly important role in the U.S. economy. In the course of the nineties, Fortune 500 companies "shed some 3.5 million jobs" (Dumaine, 1996, p.23). Small businesses (those employing 100 people or less) constitute 98 percent of U.S. businesses (Dumaine, 1992) and "small businesses are responsible for 82 percent of the jobs created in the United States" (Megginson, Scott, Trueblood, & Megginson, 1995, p. 247). Yet, of the more than six hundred thousand small businesses started each year, 80 to 85 percent fail in the first five years (Small Business Handbook, 1990). The economic well-being of some regions of the United States is dependent upon small businesses where the majority of businesses (88 percent) employ fewer than 200 people (U.S. Department of Commerce, (1990-91).

To date, little is known about the relationship between workplace learning and employee satisfaction in small to mid-sized companies. Studies by Des Reis (1993) and Rowden (1995) have found that such firms may not even be aware of the nature and extent of learning in their workplaces. Yet it is likely that the success of such companies is at least attributable to the ways in which employees are attended to, formally and informally trained, and developed.

Statement of the Problem

This study will establish the nature and extent of workplace learning, and delineate the relationship between workplace learning and employee satisfaction in small to mid-sized businesses in the United States and Malaysia.

Conventional wisdom says that small businesses do not have the financial resources nor the time to do very much, if any, training and development or workplace learning. This position has been supported each time quantitative research has been conducted in a variety of small businesses. However, a recent qualitative study (Rowden, 1995) found that, in fact, small businesses do engage in a considerable range of formal, informal, and incidental workplace learning activities. The information gleaned from the interviews, observations, and documents provide a new foundation upon which questionnaires can be developed that can assess the extent of workplace learning from a perspective that small businesses truly understand.

Another recent study (Anonymous, 1997) found that workers in small businesses were generally more satisfied with their employment situation than were workers in larger companies. The study found that 44 percent of the workers in small businesses said they were "extremely satisfied" with their jobs, compared with 28 percent at companies with 1,000 or more workers. The study speculated at some factors that lead to this sense of satisfaction in small businesses such as job security, empowerment, and the ability to do what they do best. While workplace learning was not one of the indicators in the study, the small business respondents reported they could learn and grow on the job. An assumption of this study is that a sense of satisfaction an employee feels about his or her employment can be directly linked to the efforts toward workplace learning

Therefore, this study establishes the nature and extent of workplace learning in small to mid-sized businesses; establishes the level of job satisfaction reported in the same small to mid-sized businesses; and establishes the relationship between these learning opportunities and the level of employee satisfaction in these organizations.

Methodology

A quantitative research design was deemed the most appropriate way to understand the relationship between workplace learning and employee satisfaction. A survey instrument was developed that captures the essence of the findings on workplace learning revealed by the Rowden (1995) study combined with the Spector Job Satisfaction Survey (1997).

As with most studies of this sort, locating appropriate businesses and gaining agreement to conduct the inquiry was very difficult. There is no central clearinghouse for small businesses. The Small Business Administration does not maintain a list of small businesses throughout the U.S. Dun and Bradstreet has a section for small businesses, but it is limited to publicly traded firms. The Private Industry Council maintains a list but it is limited to members of the PIC, and most small to mid-sized businesses are not members of the PIC. The local Chamber of Commerce maintains a membership list but it is by city or region only. The use of their list would require contacting the several hundred thousand local Chambers, and again, many small businesses are not

members.

The best means of locating a broad-based population of small businesses was through the use of INC Magazine's 1998 list of the 500 Best Small Businesses and the Forbes Private-500 list of the top privately held small businesses in the U.S. While use of such lists does constitute a convenience sample, this was deemed the most appropriate way to locate a wide variety of small to mid-sized business throughout the United States. These lists carried small businesses from all arenas and identified firms that fell within the criteria of the study.

To date, 34 companies have been contacted with three agreeing to participate in the study. These three companies have yet to return their surveys. Part of the difficulty in finding companies that will participate is the requirement that nearly all workers in each company need to complete the survey. The surveys are administered by the principle of the company (owner, president, CEO, or General Manager). Once completed, they are mailed back to the researcher. This method is less intrusive to the company.

Greater success has been had in Malaysia. There five companies have also agreed to participate in the study. These companies have returned a total of 228 surveys. The process for distribution of the survey was they same. Potential companies were identified through a relationship with the university rather than through use of a list as the country is much smaller than the U.S.

Instrument Development

There is limited research on HRD in small to mid-sized businesses. Most people believe that small businesses do little, if any, development of their workers. For example, *Training Magazine*, which conducts a huge study of the training industry in the U.S. annually, does not even attempt to contact businesses with fewer than 100 employees. Companies with between 100 and 500 workers only constitute around 16 percent of their sample.

Several attempts have been made to determine the nature and extent of HRD in small business resulting in confirmation of this notion. A review of several of the studies determined that a likely cause of the lack of discovery of workplace learning in small businesses was due to the design of the surveys. A qualitative study by Rowden (1995) did reveal numerous indices of workplace learning in small to mid-sized businesses. By looking at the transcripts of interviews of workers and field notes of the researcher, it was believed that previous attempts to capture workplace learning in small to mid-sized businesses was due in large part by the language of the questionnaire. Making every attempt to stay as close as possible to the language and references used by actual workers in small to mid-sized businesses, a survey was developed to attempt to capture the nature and extent of workplace learning in these businesses.

The research on job satisfaction in small businesses mirrors that of HRD in small businesses. Until a recent study by Anonymous (1997), little attention had been paid to worker job satisfaction in small businesses. This study found that workers in small businesses, generally, were more satisfied with their work than were workers in larger businesses. The study did not, however, seek to determine *why* the workers were more satisfied. The study mentioned ideas like better communication, a feeling of being in on things, and a smaller power distance—but none were actually measured. Again based on the Rowden (1995) study, a possible connection could be made between workplace learning and job satisfaction. To determine if this hypothesis were true, workplace learning and job satisfaction would have to be measured in the *same* small businesses. Then, correlational measures could be made to determine if small to mid-sized businesses with high measures of workplace learning *also* had high measures of job satisfaction. The Spector (1997) Job Satisfaction Survey was determined to be the best-validated and reliable instrument for this purpose. A modified version was incorporated into the questionnaire along with request for background data.

Once developed, the instrument was reviewed by area experts and graduate HRD classes to ensure for content validity. The Malaysian version required some modification for cultural differences. For example, religious education had to be added since this is often provided for by Muslim employers and the "married—not married" question had to be expanded to cover all possibilities since the feedback indicated "not married" sounded too much like a *curse* to them.

Measures

The three constructs or dependent variables for the workplace learning portion were formal, informal, and incidental learning. The formal learning scale (10 items, Chronbach's alpha = .80) included items measuring respondent's perceptions of planned, organized training activities. The informal learning scale (8 items, r = .82) included items measuring respondents perceptions of unplanned or spontaneous activities that lead to perceived learning on the job. The incidental learning scale (6 items, Chronbach's alpha = .78) included items designed to

measure respondents perception of normal workplace activities that resulted in learning even though that was not the purpose of the activity—a side benefit of the work activity.

The nine dependent variables for the job satisfaction portion were pay, promotion, supervision, benefits, contingent reward, operating procedures, coworkers, nature of work, and communication. The pay scale (4 items, Chronbach's alpha = .75) includes items measuring respondents perception of the fairness of compensation and raises. The promotion scale (4 items, alpha = .73) measures their perception of the availability and fairness of promotion opportunities. The supervision scale (4 items, Chronbach's alpha = .82) measures the respondents perception of the quality and effectiveness of supervision. The benefits scale (4 items, alpha = .73) looks at the perceived value of fringe benefits. The contingent rewards scale (4 items, Chronbach's alpha =. 76) measures the respondents satisfaction with rewards (not necessarily monetary) given for good performance. The operating conditions scale (4 items, alpha = .62) measures the respondents satisfaction with rules and procedures. The coworker scale (4 items, Chronbach's alpha = .60) measures the respondents perception of the caliber and quality of coworkers. The nature of work scale (4 items, alpha = .78) measures the respondents satisfaction with the type of work done. The communication scale (4 items, Chronbach's alpha = .71) measures the respondents satisfaction with communications within the organization. The JSS scale received a total Chronbach's alpha of .91.

Analysis

The data was analyzed in a variety of ways. First, simple descriptive statistics (means; measure of variation—standard deviations; frequencies) were employed for the surveys from each company to determine the nature and extent of workplace learning in that company, and to determine the level of employee satisfaction in that company.

Then all independent variables having both theoretical significance and adequate variability were submitted to one-way analysis of variance (ANOVA), in order to identify significant relationships and to focus subsequent analysis on key variables. Inferences were based on F-value which compared the between group variance and within group variance. The Tukey-HSD method with .05 significance level was used for the procedure. The application of one-way ANOVA was based on the test of homogeneity of variance using Leverne's statistics. In cases where there was non-homogeneity in variance, a non-parametric statistics using Kruskal Wallis test was employed.

The Pearson product-moment correlation was conducted to determine the strength and direction of relationship between workplace learning and employee satisfaction across the companies. The sign of coefficient indicates the direction of the relationship. A positive correlation coefficient (r) indicated a positive relationship, while a negative coefficient reflected otherwise. The greater the absolute value of the coefficient, the stronger the relationship, and vice versa. The significance level of .05 (one-tailed) was used in this study.

When complete, descriptive comparison will be made between findings in the United States and Malaysia

Findings

Description of the Sample

Insufficient data was available from U.S. companies at the time of this writing to allow for analysis. However, 228 respondents from five Malaysian firms have responded and those data were analyzed. The five companies consisted of a manufacturing firm, financial services (2), an educational/training company, and a non-government organization (NGO). The manufacturing firm has been in business for 11 years, employs 54 people, and has gross annual revenues of RM 3, 000,000. The financial services companies have been in business for around 10 years, employ a combined 150 people, and produce annual gross revenues of RM 360,000,000. The training company has been in business for eight years, employs 100 people, and has gross revenues of RM 3,000,000. The NGO has been in business for 12 years, employs 124 people, and while it does not generate revenue it has an annual budget of RM 2,000,000.

All the respondents worked full time. Fifty two percent were female. Twelve percent were managerial, fifteen percent were supervisory, sixteen percent were technical, twenty eight percent were administrative / secretarial, and twenty nine percent were production. Twenty nine percent were between 21 and 34 years of age, thirty six percent were between 35 and 44, twenty four percent were between 45 and 54, and ten percent were over 55 years old. Sixty three percent were married. The managers reported earning more than RM 4000 per month, the supervisory and technical people earned between RM 2000 and RM 4000 per month, and the administrative and production workers all reported earning between RM 1000 and RM 3000 per month. (at the time of this writing, the

currency conversion rate was RM 3.8 = $1 US). Seventeen percent had been employed less than one year, sixteen percent had been employed for between one and three years, twenty two percent had been employed between three and five years, twenty eight percent had been employed between six and ten years, thirteen percent had been employed between eleven and twenty years, and four percent had been employed for more than twenty years.

Results

Fifty seven percent of the respondents indicated that they engaged in formal workplace learning activities. Sixty three percent indicated that they engaged in informal learning activities. And, seventy one percent of the respondents indicated that they engaged in incidental learning activities in the workplace. Sixty two percent of the respondents indicated that they were either very satisfied or satisfied with their job, indicating a high level of job satisfaction. While the sample is limited to five companies, there is a high correlation (.87) between the levels of workplace learning and job satisfaction.

Discussion and Conclusion

This is obviously a preliminary report on a long-term project that still has a long way to go. Even so, these findings are significant for exploring the relationship between workplace learning and employee satisfaction. A number of practical implications can be drawn that are of interest to HRD and managers in companies small and large, in day-to-day operations. Additionally, it would also bear great significance for teachers of human resource development, human resource management, and management. This material could provide techniques to promote operational methods to help assure organizational success.

The majority of the respondents in these small businesses indicate that they engage in activities that relate to workplace learning; and, the respondents in these same businesses indicate that they have a high level of job satisfaction. The first major finding is that it is possible to develop an instrument that measures HRD in small businesses. This quantitative method verifies previous qualitative findings. Also, the high correlation between workplace learning and job satisfaction leaves open the possibility that further study will be able to firmly establish a link between organizations that promote learning in the workplace and the level of job satisfaction experienced by their workers. As more data comes in from companies in the U.S. additional data analysis will be conducted.

Reframing the Andragogical Model of Adult Learning

Elwood F. Holton III
Louisiana State University

Richard A. Swanson
University of Minnesota

The andragogical model has stood for many years as a central model of adult learning. However, the model never explicitly accounted for a number of factors that may alter applicability of the core principles in a given learning situation, even though Knowles writes that the model must be adapted to fit the situation. An expanded model, Andragogy in Practice, is offered that more explicitly accounts for factors that must be considered in shaping andragogy to fit the situation.

Keywords: Andragogy, Adult Learning

In the late 1960s when andragogy and the concept that adults and children learn differently was introduced in the United States by Knowles, the idea was groundbreaking and sparked much subsequent research and controversy. Since the earliest days, adult educators have debated what andragogy really is (Henschke, 1998). Spurred in large part by the need for a defining theory within the field of adult education, andragogy has been extensively analyzed and critiqued. It has been alternately described as a set of guidelines (Merriam, 1993); a philosophy (Pratt, 1993); or a set of assumptions (Brookfield, 1986). The disparity of these positions is indicative of the perplexing nature of andragogy; but regardless of what it is called, "it is an honest attempt to focus on the learner. In this sense, it does provide an alternative to the methodology-centered instructional design perspective" (Feur & Gerber, 1988). Despite years of critique, debate and challenge, the core principles of adult learning advanced by andragogy have endured (Davenport & Davenport, 1985; Hartree, 1984; Pratt, 1988), and few adult learning scholars would disagree with the observation that Knowles' ideas sparked a revolution in adult education and training (Feur & Gerber, 1988). Brookfield, positing a similar view, asserts that andragogy is the "single most popular idea in the education and training of adults" (1986). Adult educators, particularly beginning ones, find them invaluable in shaping the learning process to be more conducive to adults.

However, these core principles are also incomplete. There are a variety of other factors that affect adult learning in any particular situation and may cause adults to behave more or less closely to the core principles. These include individual learner differences, situational differences, and goals and purposes of learning. Andragogy works best in practice when it is adapted to fit the uniqueness of the learners and the learning situation. Unfortunately, the andragogical model has never explicitly accounted for these situational differences although Knowles (1984) always stressed adapting andragogy to fit the situation:

> The andragogical model is a system of elements that can be adopted or adapted in whole or in part. It is not an ideology that must be applied totally and without modification. In fact, an essential feature of andragogy is flexibility (p. 418).

The purpose of this paper is to re-examine and update andragogy as a guiding framework for adult learning. A model is developed, called "Andragogy in Practice," which places the core principles of andragogy in a framework to make it more flexible and adaptable. This is accomplished by explicitly accounting for other factors that affect the learning situation. A secondary purpose is to clarify confusion in the literature about the exact number of andragogical principles.

The Traditional Andragogical Model

A re-examination of andragogy necessitates a brief discussion or explanation of the traditional model. Popularized by Knowles (1968), the original andragogical model presents core principles of adult learning and important assumptions about adult learners. These core principles of adult learning enable those designing and conducting

Copyright © 1999 E. F. Holton III and R. A. Swanson

adult learning to design more effective learning processes for adults. The model is a transactional model in that itspeaks to the characteristics of the learning transaction, not to the goals and aims of that transaction. As such, it is applicable to any adult learning transaction, from community education to human resource development in organizations.

Core Principles of Andragogy

Depending on which citation is consulted, various authors present andragogy in different ways. Accordingly, it has often been difficult to ascertain both the number and content of the core principles of andragogy. This difficulty stems from the fact that the number of andragogical principles has grown from 4 to 6 over the years. However, the addition of assumptions and the discrepancy in the number cited in the literature has led to considerable confusion.

Figure 1 shows the six principles of the current model, as well as the ones cited in Knowles' previous works. As the figure indicates, andragogy was originally presented with 4 assumptions, numbers 2 – 5 (Knowles 1980, 1978, 1975). Assumption number 6, motivation to learn, was added in 1984 (Knowles, 1984) and assumption number 1, the need to know, was added in more recent years (Knowles, 1989, 1990).

The six core principles of andragogy included in the current model are:

1. Adults need to know whey they need to learn something before learning it.
2. The self-concept of adults is heavily dependent upon a move toward self-direction.
3. Prior experiences of the learner provide a rich resource for learning
4. Adults typically become ready to learn when they experience a need to cope with a life situation or perform a task.
5. Adults' orientation to learning is life-centered and they see education as a process of developing increased competency levels to achieve their full potential.
6. The motivation for adult learners is internal rather than external.

These core principles provide a sound foundation for planning adult learning experiences. Absent any other information, they reflect the best approach to effective adult learning.

Learner self-concept (self-directed)	□	□	□	□	□	□
Learner's Experience	□	□	□	□	□	□
Readiness to Learn (life tasks)	□	□	□	□	□	□
Orientation to Learning (problem-centered)	□	□	□	□	□	□
Motivation (internal)	□	□		□		

Reframing Andragogy

The power of andragogy lies in its potential for dynamic application, not as a rigid recipe for action. However, over the years the assumptions became viewed as dogmatic and unbending principles, rather than flexible assumptions to be altered depending on the situation. There is clear evidence that Knowles never intended for them to be viewed this way. For example, Knowles stated early on that:

> My intention, therefore, was to present an alternative set of assumptions to those that had been traditionally made by teachers of children, so that others would have another choice. I saw them as assumptions to be tested (not to be presumed), so that if a pedagogical assumption was the realistic condition in a given situation then pedagogical strategies would be appropriate. For example, if I were now, at age 66, to undertake to learn a body of totally strange content (for example, the higher mathematics of nuclear physics), I would be a totally dependent learner. I would have very little previous experience to build on, I probably would have a low degree of readiness to learn it, and I don't know what developmental task I would be preparing for. The assumptions of pedagogy would be realistic in this situation, and pedagogical strategies would be appropriate.
>
> I would like to make one caveat to this proposition, though: an ideological pedagog would want to keep me dependent on a teacher, whereas a true andragog would want to do everything possible to provide me with whatever foundational content I would need and then encourage me to take increasing initiative in the process of further inquiry. (1979, 52-53)

More recently, Knowles stated in his autobiography:

> So I accept (and glory in) the criticism that I am a philosophical eclectic or situationalist who applies his philosophical beliefs differentially to different situations. I see my self as being free from any single ideological dogma, and so I don't fit neatly into any of the categories philosophers often want to box people in. (1989, p. 112)

Unfortunately, Knowles never offered a systematic framework of factors that should be considered when applying andragogy. As a result, andragogy has been criticized in two fundamental ways.

First, the andragogical assumptions about adults have been criticized for appearing to claim to fit all situations or persons (Davenport, 1987; Davenport & Davenport, 1985; Day and Baskett, 1982; Elias, 1979; Hartree, 1984, Tennant, 1986). That is, andragogy appears to claim that all adults in all learning situations fit all of the assumptions. While a more careful read of Knowles' work shows he did not believe this, andragogy is nonetheless open to this criticism because it fails to explicitly account for the differences. Pratt (1988) offered a contingency approach to adult learning that explicitly takes into account variations in adults' readiness to learn in an andragogical manner by examining dimensions of the situation and learner. Because of the conceptual uncertainty, Merriam and Caffarella (1991) go so far as to say that "since andragogy now appears to be situation-specific and not unique to adults, technically it does not qualify as a theory of adult learning" (p. 250).

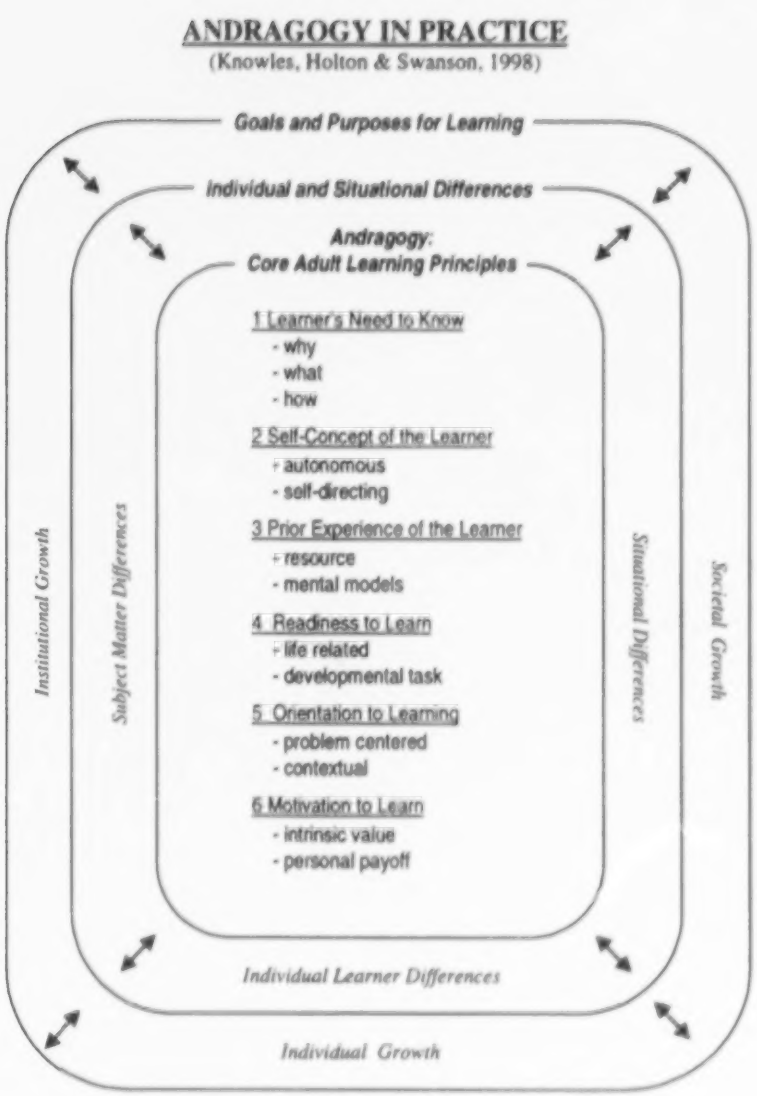
A second set of criticisms focused on andragogy's philosophical stance with regard to adult education. Grace (1996), for example, criticizes andragogy for focusing solely on the individual and not operating from a critical social agenda or debating the relationship of adult education to society. Cross concludes that "whether andragogy can serve as the foundation for a unifying theory of adult education remains to be seen" (1981, p. 227). Others have pushed for adult learning theory to reach beyond the teaching-learning transaction to encompass some elements of desired outcomes. Most prominent of these include perspective transformation (Mezirow, 1991) and a critical paradigm of self-directed learning (Brookfield, 1984b, 1987). Pratt (1993) also criticizes andragogy for not adopting a critical paradigm of adult learning.

We believe that these criticisms point to missing elements that keep it from being a defining theory of the discipline of adult education (Davenport & Davenport, 1985; Grace, 1996; Hartree, 1984), not of adult learning. What many of these critics implicitly attempted to do was to equate adult learning, and, by extension, andragogy with the discipline of adult education. Adult education as a discipline has certain philosophical foundations regarding the role of education in society and the desired outcomes from adult education (Merriam & Brockett, 1997). Andragogy's critics are correct in saying that andragogy does not explicitly and exclusively embrace these

outcomes, but they are incorrect in thinking that it should. These criticisms reflect different perspectives about the goals and purposes of the discipline of adult education, not of andragogy.

Attempts to embed the specific goals and purposes of adult education into the andragogical model of adult learning are conceptually flawed. Adult learning occurs in many settings for many different reasons. Andragogy is a transactional model of adult learning that is designed to transcend specific applications and situations. Adult education is but one field of application; others might include organizational human resource development and higher education. The debate about goals and purposes of adult education is important, but should be separated from models of the adult learning process. It seems clear that there is a need to reframe andragogy by more explicitly taking into account key factors that affect the application of andragogical principles.

Figure 2 - Andragogy in Practice Model



The Andragogy in Practice Model

Andragogy in Practice, the model depicted in Figure 2, is offered as a new approach to more systematically apply andragogy across multiple domains of adult learning practice. The three rings of Andragogy in Practice are: (1) Goals and Purposes for Learning, (2) Individual and Situation Differences, and (3) Andragogy: Core Adult Learning principles.

In contrast to the traditional model of andragogy, this new model integrates the additional influences – the uniqueness of the individuals and the situation – with the core adult learning principles. The three rings of the model interact, allowing the model to offer a 3-dimensional process for adult learning situations. The result is a model that systematically recognizes this lack of homogeneity among learners and learning situations, and effectively illustrates that the learning transaction is a multi-faceted activity. This new perspective presents a more complete model that allows for greater and more efficient application to a multitude of adult learning situations.

Goals and Purposes

"Goals and Purposes for Learning," the outer ring, are portrayed as developmental. The goals and purposes of adult learning serve to shape and mold the learning experience. In this model, goals for adult learning events may fit into three general categories: individual, institutional, or societal. Care must be taken so as not to confuse core principles of the adult learning transaction, with the goals and purposes for which the learning event is being conducted. They are conceptually distinct, though as a practical matter may overlap considerably.

Consider adult literacy programs as an example. Such programs may be conducted by an adult education center to help individuals improve life skills (an individual goal); by a corporation to improve job and organizational performance (an institutional goal); or by some other entity seeking to help a disadvantaged group of citizens improve their socio-economic position (a societal goal). While the goal differs in each of these situations, the actual learning program and desired learning outcomes may be quite similar or even identical. Therefore, andragogy is equally applicable to each scenario because andragogy focuses on the learning transaction, as opposed to the overall goal for which the program is offered. Because the goal will have an effect on the learning transaction, it must be carefully considered. For example, when offered for societal improvement purposes, extra emphasis may be placed on developing self-directedness among the learners. However, this is not part of andragogy, but the context in which andragogy is utilized.

This illustrates the strength of andragogy: it is a set of core adult learning principles that apply to all adult learning situations. The goals and purposes for which the learning is offered are a separate issue. Professionals involved in delivering adult learning programs should develop and debate models of adult learning separately from models of the goals and purposes of their respective fields within which they utilize adult learning.

The traditional view among most scholars and practitioners of adult learning is to think exclusively of individual growth. Representative researchers in this group might include some mentioned earlier such as Mezirow (1991) and Brookfield (1987, 1984a). Others advocate an individual development approach to workplace adult learning programs (Bierema, 1996; Dirkx, 1996). At first glance, andragogy would appear to best fit with individual development goals because of its focus on the individual. However, closer examination shows that andragogy's focus is really on the individual as a learner, not the purpose for which the individual engages in learning.

Adult learning is equally powerful in developing better institutions, as well as individuals. Human resource development, for example, embraces organizational performance as one of its core goals (Swanson & Arnold, 1996), which andragogy does not explicitly embrace either. From this view of human resource development, the ultimate goal of learning activities is to improve the institution sponsoring the learning activity. Thus, control of the goals and purposes really lies with the organization. The adult learning transaction in an HRD setting still fits nicely within the andragogical framework, although the different goals require adjustments to be made in how the andragogical assumptions are applied.

Societal goals and purposes that can be associated with the learning experience can be illustrated through Friere's work (1970). This Brazilian educator sees the goals and purposes of adult education as societal transformation and contends that education is a consciousness raising process. He says that the aim of education is to help participants put knowledge into practice and that the outcome of education is societal transformation. Freire believes in man's ability to recreate a social world and establish a dynamic society, and says that the major aim of education is to help people put knowledge into action. Doing so, according to Friere (1970), will enable man to change the world – to humanize it. Friere is clearly concerned with creating a better world and the development and

liberation of people. As such, it is evident that the goals and purposes within this learning context are societal. Once again though, the actual adult learning transactions fit within the andragogical framework, though with some adjustments.

Individual and Situational Differences

"Individual and Situational Differences," the middle ring of the Andragogy in Practice Model, are portrayed as variables. We continue to learn more about the differences that impact adult learning and which act as filters that shape the practice of andragogy.. These variables are grouped into the categories of individual learner differences, subject matter differences, and situational differences.

Subject matter and situational differences are the easiest to recognize and understand. Different subject matter may require different learning strategies. For example, individuals may be less likely to learn complex technical subject matter in a self-directed manner. Or, as Knowles stated in the earlier quote, introducing unfamiliar content to a learner will require a different teaching/learning strategy. Simply, not all subject matter can be taught or learned in the same way.

Similarly, different situations may dictate different teaching/learning strategies. The situational effects category captures any unique factors that could arise in a particular learning situation. For example, learners in remote locations may be forced to be more self-directed, or perhaps less so. Learning in large groups may mean that learning activities are less tailored to particular life circumstances.

Research in individual differences has been instrumental in advancing understanding of how individual differences impact adult learning behaviors. Jonassen & Grabowski (1993) present a typology of individual differences that impact on learning which incorporates three broad categories of individual differences: cognitive (including cognitive abilities, controls and styles), personality, and prior knowledge. While there remains much uncertainty in the research, the key point is clear: individuals vary in their approaches, strategies, and preferences during learning activities. Few learning professionals would disagree. At one level, merely being sensitive to those differences should significantly improve learning. Even better, the more that is understood about the exact nature of the differences, the more specific learning theorists can be about the exact nature of adaptations that should be made.

Another area of individual differences in which our understanding is expanding rapidly is adult development. Adult development theories are generally divided into three types: physical changes; cognitive or intellectual development; or personality and life-span role development (Merriam & Cafferella, 1991; Tennant, 1995). Cognitive development theory's primary contributions are two-fold. First, they help to explain some differences in the way adults learn at different points in their life. Second, they help explain why the core learning principles are exhibited in different ways at different points in life. Role development theory's primary contribution is to help explain when adults are most ready for and most need learning, and when they may be most motivated to learn.

An understanding of individual differences helps make andragogy more effective in practice. Effective adult learning professionals use their understanding of individual differences to tailor adult learning experiences in several ways. First, they tailor the manner in which they apply the core principles to fit adult learners' cognitive abilities and learning style preferences. Second, they use them to know which of the core principles are applicable to a specific group of learners. For example, if learners do not have strong cognitive controls, they may not initially emphasize self-directed learning. Third, they use them to expand the goals of learning experiences. For example, one goal might be to expand learners' cognitive controls and styles to enhance future learning ability. This flexible approach explains why andragogy is applied in so many different ways (Knowles, 1984).

Applying the Model

We turn now to an example to illustrate how to use the Andragogy in Practice model. As a general note, we have noted interesting differences in the way people apply the model, and therefore the best way to explain it. Those familiar with the six core principles of andragogy tend to want to conceptually begin in the middle of the model, working outward to adjust the six principles to fit the individual and situational differences as well as differences due to the goals and purposes. For them, the outer two rings act as "filters" through which the core principles are examined to make adjustments. Those unfamiliar with the six principles seem to prefer to start with the outer ring and work inward. For these individuals, it makes more sense to analyze the goals and purposes first, then the individual and situational differences, and then to select which of the andragogical principles fit. The core principles are then like a "toolkit" from which applicable principles are selected.

Both perspectives have merit, depending upon the application. We suggest a three-part thinking process for approaching adult learning situations:

1. The core principles of andragogy provide a sound foundation for planning adult learning experiences. Without any other information, they reflect the best approach to effective adult learning.
2. Analysis should be conducted to understand: (a) the particular adult learners and their individual characteristics; (b) the characteristics of the subject matter; and, (c) the characteristics of the particular situation in which adult learning is being used. Adjustments necessary to the core principles should be anticipated.
3. The goals and purposes for which the adult learning is conducted provide a frame that puts shape to the learning experience. They should be clearly identified and possible effects on adult learning explicated.

Where possible, this framework should be used in advance to conduct learner analysis. When used for this purpose, it is probably best to start with the outer ring and work inward. On the other hand, if one does not have much of an opportunity to analyze the learners in advance, then it may be more appropriate to begin with the core principles as a guide, and make adjustments as the other elements of the model become known. The following example will help clarify the application of the model.

A municipal government has developed a new management development program to help change the organization to a high-performance workplace. It was developed based on best practices and thinking in performance improvement leadership. The program will challenge learners' mental models of management development as it presents a new approach to managing in the public sector. An analysis of the learners indicates that they generally fit the core assumptions of the andragogical model. This presents several problems because the program can not be conducted in a completely andragogical approach. First, the ultimate goal of the program is to enhance organizational performance. Thus, learners will not have as much choice about the content of the learning (goal factor). It was determined that considerable effort will have to be devoted to convincing the learners of the "need to know" because some may not perceive they need the program. Second, most of the learners are experienced managers who consider themselves to be reasonably accomplished at their jobs. However, it is the expertise from their past experience that needs to change, so prior experience could actually be a barrier to learning (individual difference factor). Next, it was determined that few of them had engaged in self-directed learning with regard to management issues. This fact, coupled with the unfamiliarity of the material, will make self-directed learning unlikely, at least in the early stages of the program. Further complicating the design is that there is likely to be little formal payoff because public sector employment systems do not allow for performance or skill-based pay increases (a situational factor). Much of the "payoff" will be intrinsic, and learners will have to be convinced of the value. Finally, the subject matter itself will shape the learning. The approach being taught would be unfamiliar to these managers, and relies on a complex integration of theories. Thus, some portions of the program may be more didactic than others (subject matter factor).

This example illustrates how andragogy becomes more powerful by explicitly accommodating contingencies present in most adult learning situations. In addition, by separating the goals and purposes for which learning is conducted from the model of the learning transaction, the model becomes more versatile as well as more clear conceptually.

A Holistic Model of Knowledge and Adult Learning

Baiyin Yang
University of Idaho

This paper proposes a holistic theory of knowledge and learning. The theory posits that knowledge is consisted of three indivisible facets: explicit, implicit, and emancipatory, and that it is more important to examine the dynamic relationships among the three facets of knowledge in order to better understand different learning modes.

Keywords: Nature of Knowledge, Adult Learning, Dialectics

There are three major approaches to the nature of knowledge that have dominated adult learning literature (Mezirow, 1996). Mezirow contends that the Western rational tradition constitutes an objectivist paradigm of learning. The objectivist paradigm, or is sometimes called empirical-analytic paradigm, is a set of assumptions about reality and learning. Reality is believed to exist independently of mental representations of the world and knowledge to be objective. "The educational process is to transmit accurate representations to the real world, ideally established as such by scientific test." (p. 159). On the other hand, interpretist paradigm views knowledge as subjective and is constructed from one's experience within the frame of prior interpretation. Learning is a function of forms of life and systems of language. The third paradigm, critical theory, views learning as a transformational process. Following Habermas (1971, 1984), scholars in adult learning have critiqued the empirical-analytic tradition of the field. It is argued that the knowledge produced from such tradition has served the interests of professionalization and control, and that these interests are not emancipatory (Wilson, 1993; Thompson & Schield, 1996). From the perspective of critical theory, it is important to examine the power relationship in which the knowledge is produced and whose interest is served. The three major approaches to knowledge (i.e., empirical-analytic, interpretive, and critical) have typified efforts to define the concept of knowledge from different perspectives. These perspectives have been shaped by the examination of a limited consideration of the nature of knowledge. This paper proposes a holistic theory of knowledge and learning. The theory posits that knowledge consists of three indivisible facets: explicit, implicit, and emancipatory, and that it is more important to examine the dynamic relationships among the three facets of knowledge in order to better understand different learning modes.

Three Facets of Knowledge

All of the above mentioned three paradigms view knowledge as something there in the world, either objectively representing the reality or subjectively existing in human beings. To overcome the dichotomy of objectiveness and subjectiveness, I am arguing that we should take a holistic view. We frequently hear a saying "you need to look on the other side of the coin." In fact, there are three sides of a coin: head, tale, and edge. This principle applies to the concept of knowledge: we need to examine different facets of knowledge. Knowledge is human beings' understanding about the realities through mental correspondence, personal experience and emotional affection with outside objects and situations. This definition of knowledge has the following implications. First, knowledge exists in a state of understanding within human beings. Therefore, knowledge exists only in the interaction between human beings and the outside world. Second, knowledge is learned and cumulated from personal and social life. Consequently, knowledge is shaped by both personal inner factors and outside reality. Third, there are at least three channels that link individual inner state to outside realities: mental, behavioral, and emotional processes.

The facets of knowledge are different aspects of the way in which we know the world. We can learn not only through mental corresponding (i.e., cognitive process) but also by personal direct involvement (e.g., learned motor skills). We also know things through our emotions. Because any knowing involves a person (knower), these three knowing processes are in fact all involved and they are interrelated. Consequently, knowledge has three distinct but related facets: explicit, implicit, and emancipatory knowledge. That is to say, knowledge facets reflect different processes of knowing. A holistic theory of knowledge should include three basic facets of knowledge: explicit, implicit, and emancipatory. The explicit facet consists of the cognitive component of knowledge that represents one's understandings about the realities. Explicit knowledge is codified knowledge because it is transmittable in formal, systematic language. It is technical knowledge because it reflects one's intentional and conscious effort to understand realities to meet his/her interests. The implicit or tacit facet is the behavioral

Copyright © 1999 Baiyin Yang

component of knowledge that denotes the learning that is not openly expressed or stated. In most of the cases we know more than what we think we know (Polanyi, 1967). Implicit knowledge is personal, context-specified, and therefore hard to formalize and communicate. Implicit knowledge usually comes from and exits in one's behavior, action, and accumulated experiences. However, experience itself can not automatically become knowledge. Only the learning and familiarity evolved from experience that have been confirmed to be true can be viewed as knowledge. Research has suggested that the unconscious thoughts and actions can be developed, received, stored, and recovered without the involvement of conscious awareness (Taylor, 1997). The emancipatory facet is the emotional component of knowledge and is reflected in affective reactions to outside world. Emancipatory knowledge is value-laden. It is indicated by feelings and emotions people have in relation to the objects and situations. Emancipatory knowledge defines one's view about what the world should be, and it is the result of one's efforts to seek freedom from natural and social restraints. Table 1 compares three facets of knowledge and their related characteristics.

The differences among these three facets of knowledge have both theoretical and practical importance. The explicit knowledge is based on the separation of object and subject and it serves for the interest of rationality. The implicit knowledge is established on the interrelationship between object and subject and thus is simultaneous and analog knowledge. The emancipatory facet is essential and vital knowledge that defines the meaning of an object within the subject. These three facets are different not only in nature, function, and foundation, but also in direct sources, evaluation criteria, and ultimate goals. The direct source for the explicit knowledge is logic and reasoning and it is judged by the criteria of empirical soundness, clarity, and consistency. The explicit knowledge seeks for truth and efficiency, and it tends to search for a single solution for an action that maximizes its satisfaction or utility. This facet of knowledge is facilitated by analytical intelligence and the ability to learn this knowledge facet might be measured by conventional IQ tests. The implicit or tacit knowledge derives directly from practice, experience, and recognition. It needs to be practical and communicative across situations. This facet of knowledge aims for reality, and it focuses on the effectiveness that normally requires artistic instead of scientific solutions. The ability to acquire the implicit knowledge can be viewed as practical intelligence (Sternberg, 1985, 1997). People do not just know through thinking or doing, they also acquire knowledge with their emotions and feelings. The emancipatory knowledge reflects human beings' pursuit of freedom and justice, which is advanced by values, assumptions and ethics. Serving for the quest of liberty and empowerment, the emancipatory knowledge has been evaluated by intellectual illumination and ethical responsibility. This facet of knowledge can be facilitated and indicated by emotional intelligence (Goleman, 1995, 1996). Goleman has noted that people with higher emotional intelligence tend to "have a notable capacity for commitment to people or causes, for taking responsibility, and for having an ethical outlook; they are sympathetic and caring in their relationships" (1995, p. 45).

Because these three facets of knowledge appear to be different in many aspects, researchers and theorists tend to view the concept of knowledge from one perspective or another. Consequently, only one type of knowledge seems to be valid for certain people when one facet is examined instead of a holistic look. Moreover, the academic field and related literature have been divided into camps of so called paradigms. Scholars tend to conduct their discourses within one camp or take only one perspective for the sake of consistency. Those who place their emphasis on explicit knowledge tend to examine relatively structured problems, use empirical-analytic tools of research, and build prescriptive theories and models. Those scholars who accept the implicit nature of knowledge look at less-structured problems with experiential-interpretive tools and their research outputs appear as heuristic theories and interpretations. Those who contend that emancipatory knowledge is vital for any sort of learning use such research tools as critical reflection or participatory study to probe non-structured problems, and their outcomes are normally descriptive. From a research perspective, the three facets of knowledge represent three domains of study: cognition, behavior, and affect. Each of the three domains reflects a long interest of investigation along the lines of thinking, action, and emotion respectively.

Table 1. Comparison of Knowledge Facets

	Explicit	Implicit	Emancipatory
Nature	Knowledge of rationality (mind)	Knowledge of experience (body)	Knowledge of meaning (heart)
Function	Sequential knowledge (there and then)	Simultaneous knowledge (here and now)	Essential knowledge (where and why)
Domain	Digital knowledge (theory)	Analog knowledge (practice)	Vital knowledge (spirit)
Foundation	Separation of object and subject (objective)	Interrelation of object and subject (subjective)	Object within subject (affective)
Carrier	Formal, abstract symbols & languages	Informal, concrete, and vivid experiences	Values, conscience, dignity, & ethics
Direct Source	Logic, reasoning	Practice, experience	Freedom, justice
Criteria	Empirically sound, clear, and consistency (true or false)	Workable, practical, communicative (workable or not)	Enlightening, ethical, responsible (right or wrong)
Ability to Learn	Analytical Intelligence	Practical Intelligence	Emotional Intelligence
Goal	Truth Efficiency Maximize	Reality Effectiveness Artistic	Liberty Significance Empowering
Problem Natu	Structured	Less-Structured	Non-structured
Related Theory	Prescriptive	Heuristic	Descriptive
Research Tool	Empirical-analytic	Experiential-interpretive	Critical-reflective
Research Domain	Cognition (thinking)	Behavior (action)	Affect (emotion)

Dynamic Relationships among Knowledge Facets

Although the differences among the three facets of knowledge have been long recognized, few have examined their unitary nature. While knowledge facets may come from different sources and develop toward diverse directions, as discussed above, none can simply be dismissed. A holistic theory of knowledge and learning must acknowledge all facets of knowledge. In fact, each of the three facets of knowledge provides a support needed for the other facets to exist. Explicit knowledge will exist only as meaningless facts, figures or bytes of information without the support of

other facets. People usually use "body of knowledge" to denote theories, models, empirical findings but fail to realize that these things only reflect explicit facet of knowledge. From the perspective of the holistic theory, theories and models themselves are not knowledge. They are carriers of explicit knowledge and they are simply available information when human factors are detached. As Davenport and Prusak (1998) rightly noticed, information itself is not knowledge. I think that "knowledge base" is a better term to represent explicit knowledge such as theories and models. Implicit knowledge will become random, idiosyncratic, special, and isolated events or situations without the connections of other two facets. Emancipatory knowledge will be simply emotion or affection when the explicit and implicit facets are removed. The above different terms and characteristics are divided and examined just for the discourse purpose and themselves are explicit writings with rational interest. In reality, a robust piece of knowledge consists of three interrelated facets. A holistic view of knowledge should be a dynamic dialectic among all facets.

Consideration of these facets of knowledge can be facilitated by thinking of them as angles of an equilateral triangle with the angle of the triangle being the different facets of knowledge. The inside of the triangle can be regarded as the arena of knowledge and the sides of the triangle represent interaction among the facets. While educators and researchers can view the concept of knowledge from one of the angles and work on a particular side, there is always the influence of the other two angles in the arena. Each of the angles is bounded by two angles and shaped by the inputs and influences from the other facets of knowledge. Learning can start in one of the facets and educators and learners can, consciously or unconsciously, move toward one of the directions characterized by the knowledge facets. However, any change of one facet always affects one or both of the other facets.

The dynamic relationships among the knowledge facets and related learning modes are presented in Figure 1. Three circles in the figure represent the knowledge facets and the lines with arrow refer to the interaction among the facets. It is assumed that knowledge is created through and exists in the interactions among explicit, implicit, and emancipatory facets. These relations allow us to draw at least nine modes of learning (i.e., knowledge conversion): participation, conceptualization, contextualization, systematization, validation, legitimization, transformation, interpretation, and materialization. Participation is a process of learning from practice and thereby

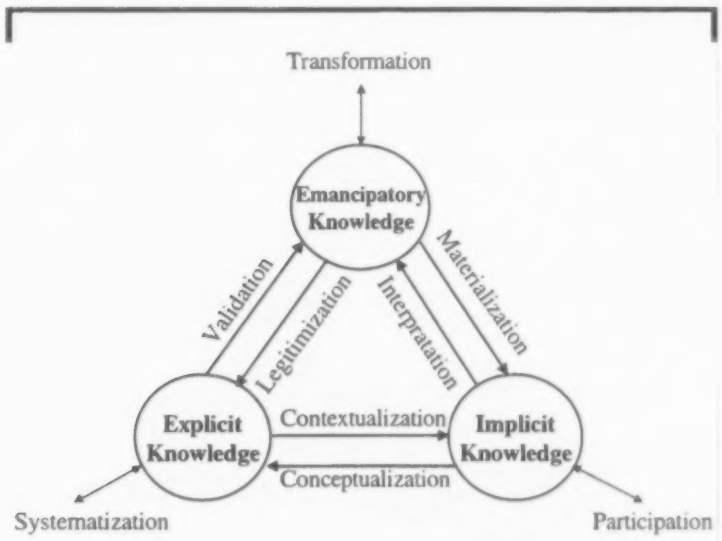

Figure 1. Three Facets of Knowledge and Implied Modes of Learning

creating implicit knowledge from experiences. The direct outcomes of the participation are unconscious mental models and technical skills such as know-how. Many learning forms such as apprenticeship, situated learning, incidental learning, interns and on-the-job-training fall into this mode of learning. Personal participation in individual and social activities will always result in implicit learning, which, in turn, develops intuitive (tacit) knowledge. Psychological studies have shown that such knowledge is optimally acquired independently of conscious efforts to learn and it can be effectively used to solve problems and make decisions (Gerholm, 1990;

Reber, 1989). If we maintain a position that knowledge is essentially implicit, then we can get a conclusion that learning can be viewed as a process of participation in communities of practice (Lave & Wenger, 1991). Conceptualization is a process of articulating implicit knowledge into explicit concepts. It converts familiarities into tangible explanations. It is a quintessential knowledge-creation process in that implicit knowledge becomes explicit, taking forms of metaphors, analogies, concepts, hypotheses, or models (Nonaka & Takeuchi, 1995). For example, a professional may summarize what have been learned from practice, reflect upon the literature in the field and write up a scholarly article for publication. The outcome of this learning process is explicit knowledge. Other professionals in the field then can learn from such explicit knowledge. The best way for them to learn is not to simply acknowledge new ideas or concepts, they have to connect and apply the new information to their particular contexts. Contextualization is a process of embodying explicit knowledge into implicit knowledge. It is the process of utilizing concepts, models, propositions in a specific context. A teacher in this learning mode examines the appropriateness of a newly developed teaching method in his/her classroom. Because there may be countless factors that affect his/her decision of adoption and the person who originally developed the method cannot anticipate all possible applicable situations, the teacher may not be able to clearly state the rationale and the process of such a decision. Therefore, such learning process that involves action or behavior will always bring about a change of implicit knowledge. Examples of this learning mode are: learning by doing, role-playing, case study, and action learning. Systematization is a process of systematizing concepts into a knowledge system with logic and reasoning. This learning process uses mind instead of body. This learning mode generally involves combining different parties of explicit knowledge in a consistent format. People exchange and combine knowledge through such forms as seminars, literature critique, or conferences. Competence-based training is a typical example of this learning mode that assumes a systematic and explicit knowledge base. Validation is a process of examining underlying values, beliefs and other kinds of fundamental learning based on explicit knowledge (which is believed to be true under rational perspective). Mezirow (1996) suggests that we establish the validity either by empirically testing to determine the truth or by appealing to tradition, authority or rational discourse. "Discourse allows us to test the validity of our beliefs and interpretations" (p. 165). Employee orientation and correctional education are two examples of this learning mode. One of the major functions of employee orientation is to assist the newcomers in learning the organizational values and expectations. It is expected that the newcomers will learn what is right and what is wrong from the standards of a particular organization, and thus change/modify their emancipatory facet of knowledge about work. Legitimization is a process of justifying explicit knowledge based upon emancipatory knowledge. For instance, many higher education institutes changed admission regulations after the civil right movement. Team building and community meetings are other examples of this learning mode. The goal of team build is to increase productivity based on trust, cohesiveness, and mutual sense of responsibility. Therefore, the essence of team building is to revise or develop explicit knowledge (i.e., clearly specified effective working conditions) by building on team members' emancipatory knowledge of the work. The effect of emancipatory knowledge on explicit knowledge can also be easily examined at the level of individual learning. One will simply reject certain information if it is contradicted to his/her fundamental values or beliefs. Transformation is a process of converting an old meaning scheme (i.e., values, feelings, ethics, etc.) into another one. It should be noted that not every transformative learning occurs in a positive direction. One longitudinal study shows that adult life experiences can result in diverse development outcomes (Merriam & Yang, 1996). For example, those who experienced a period of unemployment have expressed more sensitivity to social and economic inequality, but they felt to be marginalized, vulnerable, and controlled by external forces. Some life experiences may bring about learning with negative interpretation (Merriam, Mott, & Lee, 1996). The key to understand such complicated learning processes lies in the dynamic interactions among three knowledge facets. Some examples of transformative learning include: participatory study, non-violence action, and critical reflection. Materialization is a process of transferring emancipatory knowledge into tacit knowledge. This learning mode includes such methods as action learning, task-force, and community development. Those who utilize what they have learned from the participatory action research to improve the quality of their daily life are in the process of materialization. Interpretation is a process of making and/or revising meaning scheme from tacit learning and direct experiences. People who feel empowered and have a new look about life through a participatory action research have been involved in the learning process of interpretation. Instructional methods such as critical questioning and conscious awareness group are examples of interpretation process.

While three different and yet interrelated facets of knowledge are identified and learning modes are defined, it should be emphasized that learning rarely takes place in one domain. Examples in the previous paragraph were used to illustrate dominated learning modes for the interactions among knowledge facets. In reality, most learning activities involve more than one of three facets and a number of interactions. For example, while the main focus of a conscious awareness group is to interpret meanings based on participants' experiences, the facilitator and

participants might borrow or create explicit concept to validate their interpretation. In so called instrumental learning (Mezirow, 1990), one might involve direct changes only in explicit and implicit domains. But the emancipatory facet is also visible and it plays the function of legitimizing new information. In such learning situations, new information is congruent with one's fundamental beliefs. Most of our learning activities are instrumental rather than transformative.

Implications of the Holistic Model of Knowledge

Knowledge Facets and Paradigms of Learning and Research

There has been a lot of discussion on the paradigms of learning and research (Merriam, 1991; Mezirow, 1996). From the perspective of the proposed theory of knowledge and learning, contemporary paradigms have been evolved with emphasis on one facet of knowledge or another. The positivist or objectivist paradigm posits that only explicit facet is valid knowledge (Searle, 1993). Learning occurs as learners relate concepts descriptive of the new knowledge to previous knowledge within their cognitive structure. The integration of new and previous knowledge occurs through changes in the learners' conceptual structure. Concepts are developed and stored in a hierarchical structure. The positivist paradigm assumes that human beings are rational and take actions based on explicit knowledge. The essential element of the rationality is a conscious goal and the best action selected from all relevant alternatives that maximize the promise of reaching that goal. Unfortunately, such perspective ignores or pays less attention to the roles of unconscious learning and learning in the affective domain.

The interpretive paradigm emphasizes the implicit nature of knowledge and the changing influences of reality. Knowledge is acquired only through experiences and direct engagement in practice (i.e., participation) (Lave & Wenger, 1991). Mezirow (1990) contends that the learning process involves looking at past experiences, new experiences and reflecting on these for the purpose of making meaning. "Learning may be defined as the process of making a new or revised interpretation of the meaning of an experience, which guides subsequent understanding, appreciation, and action" (p. 1). Observing the dynamic world and the complexity of human communication, the interpretive paradigm asserts that realities are multiple and subjective and that truth is relative. Consequently, such assertion poses a dilemma. Do we want the communication of our interpretations to be as clear as if there is a single reality or, with multiple realities, a confusion that leads to no action? Such dilemma can be found from Mezirow's transformation theory. On one hand, this theory rejects positivist notion of absolute truth and it assumes that knowledge is subjective. On the other hand, this theory "seeks to establish a general, abstract, and idealized model which explains the generic structure, dimensions, and dynamics of the learning process" (Mezirow, 1996, p. 166). From the perspective of the holistic theory, all theories serve as carriers of explicit knowledge and thus have positivist elements.

The critical paradigm involves a commitment to deliberate action for justice in society where the existing social structure is seen as coercive and oppressive. It argues any adequate approach to educational theory must provide ways to distinguish ideologically distorted interpretations from those that are not (Carr & Kemmis, 1986, p. 129). Although this paradigm strongly advocates the rejection of positivist notions of rationality, objectivity and truth because of its danger to move toward hegemony, explicit learning (with a tendency of instrumental rationality) remains the major source of validation and justification (Mezirow, 1996). Without the support of two other facets, emancipatory knowledge might lead to "false consciousness".

To sum up, all paradigms have limited perspectives about knowledge and we should end paradigm wars. We need a holistic view of knowledge with a dialectic perspective. That is to say, it is necessary to realize both contradictory and confirmatory nature of knowledge. On one hand, three knowledge facets have different characteristics and move toward different directions. On the other hand, there are dynamic relationships among these facets. More importantly, knowledge is changing and learning takes place along with any change of the three knowledge facets. Consequently, while scholars and practitioners may limit their work only in one or two facets, they need to pay appropriate attention to all knowledge facets.

Implications for Adult Learning and Human Resource Development

The proposed holistic theory of knowledge provides a useful framework to reexamine conventional adult learning concepts, namely andragogy, adult development, experiential learning, feminist pedagogy, self-directed learning, and transformation theory. For instance, andragogy recognizes adult learners' experiences that can be a valid source of learning and their self-concept of responsibility. However, the dynamic relations between this learning source and other sources have not been clearly outlined. Therefore, the actual role of the instructor is not

well defined. Some instructors call themselves facilitators, yet others assume the role of experts. The proposed theory of knowledge and learning suggests that instructors have multiple roles because learning takes place in a number of modes. In one situation, which has clearly defined subject matter and consensus learning objectives, it is quite appropriate for an instructor to deal mainly with explicit knowledge and work as an expert. In another situation where learners are experienced practitioners and the objective is to exchange those hands-on experiences, one might want to assume a facilitator's role. This is because the instructor needs to provide adequate opportunities for the participants to externalize their implicit knowledge cumulated from their practice.

The difference between the concepts of andragogy and pedagogy can also be examined from the emancipatory facet of knowledge. Children in schools are normally assumed to receive knowledge and values in a passive way, and they are not expected to make the judgement of right or wrong. However, adult learners' various concerns stemmed from different value systems are legitimate contents in the adult learning process. In other words, self-directness is emancipatory right for all adults.

The proposed holistic theory of knowledge and learning also provide meaningful implications for both research and practice in human resource development. For instance, the theory suggests that we need a holistic perspective about different factors influencing the transfer of learning and performance. Traditionally, explicit knowledge has been viewed highly and thus IQ (the ability to learn explicit knowledge) has been used in many processes of human resource development such as employee selection and performance prediction. The holistic theory suggests a multi-facet nature of knowledge and learning and thus calls for a multiple intelligence approach. I believe that all three facets of knowledge are relevant in any training, though we do not have to allocate our resources and time equally among them.

Conclusions

The paper presents a holistic theory of knowledge and learning. By examining the major characteristics of three knowledge facets, it is argued that learning can be understood within the interactions among the three facets of knowledge. The conventional paradigms assume that they are divisive and thus have failed to integrate the dynamic relationships among knowledge facets. Therefore, research and theory building need to consider the nature of knowledge facets. Theories must meet the requirements of empirically sound, communicative clarity, and critical analysis (Brookfield, 1992). Clearly, more research needs to be done to test and validate the proposed theory. Because of the space limitation, this paper has largely focused on the nature of knowledge and learning at the individual level. Similar theorization needs to be done at the organizational level to explore the effective ways of managing knowledge and learning in today's ever-changing world.

The Nature of Adult Workplace Curiosity

Thomas G. Reio, Jr.
University of Maryland, College Park

A number of measurement forms have been used to guide curiosity research. An analysis of the structure and content of these measures was investigated to clarify the nature of the curiosity construct as it pertained to working adults. In this study, 233 adults ranging from 17-60 years of age were administered four well-known curiosity instruments. The scores were factored using a Principal Components Analysis and rotated to a varimax solution. Two clear and stable factors (by gender) were identified. Recommendations for future research in the field of HRD were discussed.

Keywords: Workplace, Curiosity

Robinson and Stern (1997) and others (e.g., King, 1998) have recently called attention to the relevance of adult curiosity in the workplace. King claimed that curiosity was a "natural personality trait, ...perhaps stronger in some people than in others," and it served as a basis for creativity in competitive work environments (p. 188). She stressed that from curiosity grows the motivational drive to know or learn and do more. Robinson and Stern (1997), on the other hand, considered curiosity more as a motivational state that impelled employees to seek out diverse stimuli and pursue self-initiated activities, which ultimately contributed significantly to corporate creativity. Robinson and Stern, citing the work of Arthur Koestler, declared that the intellectual curiosity we all possess leads us to explore and create, and initiate new activities. They insisted it was from these self-initiated activities that unexpected creative acts do occur. They noted further that by encouraging employees to seek diverse stimuli that promote learning about things that might not be directly related with their jobs, curiosities can be explored and possible new, unexpected, and creative applications for their learning could be found. Alternatively, in an empirical investigation of workplace curiosity, Reio (1997) determined that state and trait curiosity were both important components of successful socialization-related workplace learning and job performance. Building on the seminal work on curiosity by Daniel Berlyne (1960), he found support for the notion that curiosity and information seeking played a role in acquiring the information vital for newcomer job adaptation and job performance.

Clearly, then, King (1998), Robinson and Stern (1997), and Reio (1997) all have considered the nature of adult curiosity, either as a personality trait or motivational state, to be largely an information-seeking activity, aroused from conceptual conflicts and a lack of information, that results in creating new, useful knowledge. The problem is, this information-seeking or "cognitive" variety of curiosity may not be unidimensional (Boyle, 1983; Byman, 1993; Giambra, Camp, & Grodsky, 1992; Malone, 1981; Spielberger & Starr, 1994), nor is it the only kind of curiosity that may be of interest to learning endeavors (Bjorck-Akesson, [cf. Berliner & Calfee, 1996]).

Over the past several decades, a variety of definitions and descriptions and systems has been developed together with a wide range of new terms to describe the psychological construct of curiosity. Curiosity as a motivational state and personality trait, "sensation seeking," "exploration," "novelty seeking," and "interest" have all been used as interchangeable terms, while at the same time other researchers have considered them as being quite separate constructs (Krietler & Krietler, 1994). The structure and content of the instruments developed to measure these separate constructs, along with their theoretical underpinnings, have been scrutinized by researchers with confusing results as well. Some researchers have argued that the range of behavior described as curiosity is two-dimensional (e.g., Langevin, 1971), while others have claimed that curiosity is best thought of as being three or more dimensional (e.g., Krietler, Zigler, & Krietler, 1984). Surely, if meaningful research about curiosity and its role in various important contexts such the workplace is to be undertaken, a better understanding of the exact nature of the curiosity construct is needed.

Interestingly, almost all of the work concerning elucidation of the curiosity construct has been undertaken with children and/or college students. Langevin (1976), re-examining his prior curiosity research (1971) with a sample of Canadian children, utilized what he considered an adult sample which consisted of 53 teacher education students and 30 hospitalized schizophrenics. He concluded that the two dimensions he previously found in his factor-analytic study seeking clarification of children's curiosity (i.e., "breadth-of-interest" and "depth-of-interest") were simply artifacts of the different types of measurement forms he used. Ainley (1987) followed Langevin's research and controlled for the problems associated with his study by using a much larger sample (Australian), all the same type of measurement instruments (self-reported), and what she considered to be "adults," i.e., college students with a median age of 20 years. She concluded that Langevin's (1971) early work was correct, and curiosity

Copyright ©1999 Thomas G. Reio, Jr.

truly consisted of two factors, breadth- and depth-of-interest. (Giambra et al., [1992] also supported using Ainley's two-factor curiosity interpretation when discussing adults of any age for ease of understanding when comparing different age groups.) Spielberger and Starr (1994), too, used university students (American) in their factor-analytic work investigating the nature of curiosity and described two distinct factors ("Information Seeking" and "Experience Seeking"), although not explicitly referring to their sample as being comprised of adults. Thus, a number of researchers have found the curiosity construct to be multidimensional, and although there may be little reason to expect that curiosity's dimensionality should be distinctly different for populations of non-college age working adults, this information gap should be explored as almost none of the research concerning adult curiosity and its nature has been undertaken with typical working adults. Even less research has been conducted about conceivable gender differences (Spielberger & Starr, 1994).

To help direct future HRD research where the full benefits of promoting curiosity in the workplace can be understood, a much better awareness of the true nature of the construct is vital. A very real need exists to make clear the possible number of adult curiosity dimensions, their interpretation, and the status and nature of likely additional factors. As an engaging area of inquiry, male and female populations of subjects other than college students needed to be investigated to assist in rendering intelligible curiosity's likely multidimensional nature. Thus, the purpose of this study was to investigate the dimensionality of the curiosity construct, with an adult working population, by gender, in an effort to gain conceptual clarity about its nature and definition, thereby hopefully facilitating future HRD research into curiosity's viability as a significant component of learning in workplace contexts and beyond.

The following hypotheses guided this research:

Hypothesis 1. The curiosity construct is multidimensional.

Hypothesis 2. The number of curiosity dimensions will be equal for both working adults and college-age adults.

Hypothesis 3. The number of curiosity dimensions will be equal for both males and females.

Method

Subjects. The participants in this study consisted of 152 men and 81 women, 17 to 60 years old, from four companies in the service industry (N=233).

Instrumentation. From the number of curiosity measures reported in the literature, four well-studied instruments with 12 subscales were selected for use in this study. All of the measures chosen were self-report, paper-and-paper questionnaires as recommended by Ainley (1987). Internal consistencies ranged between .69 and .88 for all but one of the subscales which was .48 (Experience Seeking subscale of the Sensation Seeking Scale).

The selected measures were: The Melbourne Curiosity Inventory (MCI; Naylor, 1981), the State-Trait Personality Inventory (STPI; Spielberger, Barker, Russell, Silva De Crane, Westberry, Knight, & Marks, 1980), the Sensation Seeking Scale (SSS; Zuckerman, 1979), and the Novelty Experiencing Scale (NES; Pearson, 1970).

The MCI consisted of one 20-question state and one 20-question trait subscale of curiosity, while the STPI had 10-question state and trait curiosity subscales; both were considered to be measures of information-seeking or the cognitive kind of curiosity. The NES, with its four 20-question subscales, included two subscales representing cognitive curiosity (Internal and External Cognitive; NES-IC and -EC) and two subscales representing the sensation-seeking kind of curiosity (Internal and External Sensation; NES-IS and -ES). With the sensation seeking kind of curiosity, novel sensations and changing experiences are sought out more often merely to experience them, not necessarily to acquire information and knowledge per se. The SSS consisted of four 10-question subscales measuring four dimensions of the sensation seeking kind of curiosity: Thrill-and-Adventure Seeking (SSS-TAS), Disinhibition (SSS-DIS), Boredom Susceptibility (SSS-BS), and Experience Seeking (SSS-ES). Thus, the MCI, STPI, NES, and SSS are essentially trait measures of curiosity, with only the MCI and STPI including a state curiosity subscale.

Procedure. The selected curiosity measures were administered to all 233 subjects at their places of work along with a demographic survey. The four companies, all operating in the Washington, DC metropolitan area, participated on the condition of anonymity and were fully informed of the results. The purpose of the study was first explained to each subject, and the measures were then distributed, with an average administration time of 45 minutes per individual.

Combination of the Sample. One-way ANOVAs (1 X 4 groups) were conducted and patterns of partial correlations were examined for each of the variables of this study. On the basis of the lack of a significant difference between the four groups with regards to their scores on the curiosity instruments and the consistency of

the correlational patterns, it was deemed appropriate to combine the four samples. Factor-analytic work performed later in the study further supported the sample combination.

Data Analysis. All data analyses were performed with the Statview 4.0 statistical routine.

Results

As was previously endorsed by Ainley (1987), the scores from each curiosity subscale were entered as variables in a factor analysis. Initially, the Principal Components Analysis (PCA) factor extraction method was performed on all variable scores of the 12 subscales based on the matrix of their Pearson product-moment correlations. Using the Kaiser Criterion, where all factors with eigenvalues greater than one are retained and usually rotated for the final solution, only four of the five factors were extracted.

As a general rule of thumb, after a PCA, an acceptable number of eigenvalues greater than one should be between the number of variables divided by five and the number of variables divided by three (Tabachnick & Fidell, 1989). Since there were 12 variables, one would predict having between two and four factors, and there were four.

The eigenvalues of the four identified factors were 3.63, 2.18, 1.51, and 1.25, accounting for 30.3 percent, 18.2 percent, 12.6 percent, and 10.4 percent of the total variance, respectively. Consequently, 71.5 percent of the total variance was explained by the four extracted factors. A three-factor solution, too, was examined as advocated by Boyle (1989), and Byman (1993). The three factors accounted for 61.1 percent of the total variance.

Other factor-analytic research on similar self-reported, questionnaire measures of curiosity (e.g., Ainley; Langevin, 1971) claimed, in the interest of clarity and parsimony, that two curiosity factors would be sufficient to describe the curiosity construct. Cohen and Cohen (1983) would seem to agree with this "less is more" approach, as this approach assures "more statistical test validity, more power, and more clarity in the meaning of the results" (p. 171). Recognizing that the Kaiser Criterion may over- or underestimate the number of factors (Tabachnick & Fidell, 1989), a scree test was used as a second criterion. Two factors were comfortably identified by this method (clearly supporting hypothesis one). With this in mind, a two-factor solution was examined as well and the total variance explained was 48.5 percent.

Once the set of two, three, and four factors were extracted from the correlation matrix by the PCA, they were rotated to increase interpretability of the factor solution. Thus, to increase the ease of interpreting, describing, and reporting the results, a varimax rotation (orthogonal, factor scores were generated and subsequently used for predictive procedures not part of this study) was performed, as recommended by Tabachnick & Fidell (1989). The results of the varimax rotations are located in Table 1.

Careful examination of the two-, three, and four-factor solutions yielded interesting results. With the four-factor solution, both of the state and trait measures of the MCI and STPI loaded on Factor 1. This reflects the moderate to high correlations among the MCI and STPI subscales, and the significant overlap between the state and trait measures, which supported Spielberger and Starr's (1994) findings. Only two curiosity subscales loaded on Factors 2 and 3, indicating that they may be unstable factors and should be viewed with caution (Tabachnick & Fidell, 1989). Factor 4 was also difficult to interpret because of the number of cross-loadings of the variables. Thus, the four-factor solution seemed at least somewhat suspect.

A three-factor solution, although strongly advocated in the literature by Boyle (1989) and Byman (1993), was unclear as well, as the SSS-ES loaded ambiguously on both Factors 2 ("Venturesomeness" as advocated by Byman) and 3 ("Experience Seeking" as recommended by Olson & Camp [1984]). Moreover, both the NES-IC and -EC subscales loaded ambiguously on Factors 1 ("Cognitive Curiosity" as named by Malone [1981]) and 2.

In the two-factor model, all but one of the loadings of the SSS subscales and NES' sensation subscales loaded clearly on Factor 2. The second factor closely resembled Ainley's (1987) "breadth-of-interest" curiosity factor and because of its sensation seeking nature, this factor will be called "Sensation Seeking" henceforth. Factor 1 had reasonably unambiguous loadings. The first curiosity factor closely resembled Ainley's "depth-of-interest" curiosity scale and because of its cognitive nature, this factor will be called "Cognitive Curiosity," as first proposed by Malone (1981). Consequently, the second hypothesis was supported which specified that there would be no difference in the number of curiosity factors between samples of college students and working adults. This result is particularly interesting as it has never been explored.

Upon examining the factor structures for gender differences, all of the subscales loaded almost identically for both genders. Thus, the two-factor solution was stable for both genders, fully supporting the third hypothesis.

Table 1

Varimax Rotation of Two, Three, and Four Curiosity Factors: Curiosity Subscales

Scale	Four-Factor Solution				Three-Factor Solution			Two-Factor Solution	
	1	2	3	4	1	2	3	1	2
MCI-T	85	05	02	16	85	11	04	81	04
STPI-T	84	04	02	08	84	01	01	77	09
STPI-S	84	04	01	05	82	03	02	76	03
MCI-S	80	00	10	13	80	04	09	78	08
NES-ES	02	90	11	14	11	79	18	07	76
SSS-TAS	02	90	07	06	09	74	15	08	69
SSS-BS	03	04	86	02	01	03	84	23	46
SSS-DIS	08	24	77	09	12	15	79	27	59
NES-IS	01	13	13	79	79	60	02	33	48
NES-IC	37	02	30	75	75	54	40	72	08
NES-EC	34	34	24	60	43	58	28	63	28
SSS-ES	02	01	53	55	16	35	43	13	52

Note. Decimal points excluded.
Factor loadings ≥ .30 are significant. All bold numbers are negative loadings.

Rationale for the Two-Factor Curiosity Solution. In the four-factor solution, two of the factors had but two significant loadings which indicated factor instability and need for extreme caution in interpreting the results (Tabachnick & Fidell [1989] recommended it may be best to ignore this type of factor because "one never knows if such factors are 'real,'" p. 605). In the three-factor solution, there were also a number of significant cross-loadings (4) among the variables (especially between Factors 1 and 2). Accordingly, based on the scree test, the results of this research, and prior research which favored the parsimony of the two-factor model (e.g., Ainley, 1987), a two-factor solution seemed most appropriate. Yet, are these results conceptually sound?

Malone (1981) claimed that curiosity could be best thought of as being separated into cognitive and sensory components, which the two-factor solution from this study clearly does. Langevin's (1971) and Ainley's (1987) research supports this interpretation as well. While the four-factor solution indicated that curiosity could be thought of as Cognitive Curiosity, Venturesomeness, Experience Seeking, and "Novelty Seeking," respectively, more research would be needed to determine whether the Venturesomeness and Experience Seeking factors are truly unique factors. Intuitively, the difference between the two factors is quite minor as they both encompass the orientation to experience change and variation, despite social or physical risks.

In the three-factor solution, all of the NES' subscales loaded on both the Venturesomeness and Cognitive factors suggesting the instability of the Venturesomeness factor. This is in contradiction to the interpretation of Byman (1993) who re-analyzed Ainley's (1987) original data and claimed there was a very real need to include the Venturesomeness-curiosity factor to fully understand the curiosity construct; yet, it is clear Ainley's data only called for a two-factor interpretation as the third factor in her analysis had but two significant loadings. In addition, results of her scree test called for but a two-factor interpretation. In this study, the Venturesomeness factor is not consistent between the four-and three-factor solution.

Therefore, while it is acknowledged that the four- and three-factor interpretations may have merit, there is a lack of sufficient empirical evidence to fully support them. The lack of conceptual clarity is also a concern. Thus, for the purposes of this study, a two-factor curiosity solution was deemed to be most reliable.

Discussion

These results lend support to the two-factor interpretation of adult curiosity first reported by Ainley (1987) and Langevin (1971) with college students and children, and contradicts the findings of researchers like Byman (1993) who favored viewing curiosity as consisting of three and possibly more dimensions. Moreover, there was no evidence of a single, general curiosity factor as was first predicted by Berlyne (1966), the "Father of Curiosity" and later partially supported by Langevin (1976). Rather, the factor structure of the test scores, by gender, demonstrated

the multidimensional nature of the curiosity construct by the existence of two clear and parsimonious groupings within the set of adult curiosity scales.

The findings of this study indicated that a two-factor interpretation of adult curiosity provided an appropriate classification system for curiosity with what this researcher considers as "real-world adults," placed in a real-world context like the workplace. The two-factor distinction provides clarity about adult curiosity's exact nature and definition, and would be useful for guiding further research in the field of HRD by providing a clear point of departure for exploring the role and meaningfulness of curiosity as a motivator and promoter of learning. For instance, the factor scores generated from this study could be used in regression models for predictive procedures about relevant workplace variables, as was done by Reio (1997). Further, the curiosity factors could be used in a priori proposed theoretical models to test the fit of structural models to the research data.

The results of this research help to explain the nature of adult curiosity and thus clear the path for future researchers who might be interested whether and how the Cognitive or Sensation-Seeking types of curiosity have positive or negative roles in the process of workplace learning. This new knowledge would be also be helpful in exploring which type of curiosity is more valuable in fostering workplace creativity, and in which particular situation and context. Other research directions might include: What are the best methods of promoting the two types of curiosity in formal and informal learning endeavors? Can curiosity in general be used in disparate workplace cultures to promote adaptation to change? Is the desirability of curiosity more of a cultural phenomenon that has little relevance in non-western oriented workplaces? Are there gender or ethnic differences in this social desirability as well? Is there such a thing as "too much" curiosity? The field of HRD would benefit much from such knowledge.

The Adoption of Computer Technology and Telecommunications: A Case Study

Larry M. Dooley
Texas A&M University

Teri Metcalf
The Center for Distance Learning Research

Ann Martinez
The Center for Distance Learning Research

Helping staff use technology effectively may be the most important step in realizing the current and future investments in technology. To address the lack of technology training and staff's reaction to computer technology usage, this study used two theoretical underpinnings: Diffusion of Innovations (Rogers, 1983) and the Concerns-Based Adoption Model (CBAM) (Hall, Wallace, & Dossett, 1973). This framework provides guidance for professional development strategies for all training settings.

Keywords: Telecommunications, Computer Technology, Case Study

Since January 1997 the Center for Distance Learning Research (CDLR) has provided technology training to teachers in over 50 school districts in Texas and New Mexico. Most are small, rural districts and many are recipients of grants from the Texas Telecommunications Infrastructure Fund (TIF) and Technology Integration in Education (TIE) initiatives that support technology implementation.

Training is usually conducted at the school district sites by two trainers. Up to 20 teachers may participate in training sessions, provided that there is a computer workstation per participant. The CDLR encourages districts to use the train-the-trainer model, so CDLR trainers conduct a series of training sessions with a group of master teachers who will then train their colleagues.

The only one of these recommendations that has been strictly enforced and consistently followed is having one computer workstation per participant. In spite of strong recommendations to keep participation to 20 or fewer master teachers, many small district administrators insist that everyone be trained. The consequence is a large group of people with a large range of proficiency levels and a large range of training needs that often should be dealt with on a one-to-one basis. Unfortunately, as the group gets larger the amount of one-to-one hands on assistance gets smaller. Also, when administrators mandate that everyone be trained, many participants resent having to participate in training, particularly if it occurs on a Saturday or during the summer.

The CDLR had developed a training brochure, entitled "Teaching and Learning with Technology," with 11 training modules from which to choose. The brochure states, "These technology training modules are designed to help teachers (trainers) develop the skills and strategies for using emerging technologies in instruction and management." (1997, CLDR) The brochure was used as a menu and helped clients to identify training needs, but CDLR trainers have also conducted needs analyses to customize training to needs beyond menu offerings.

During the first year, most of the training focused on the brochure menu items that were organized as modules, and included basic computer applications. In 1998, training emphasis moved from basic computer applications to telecommunications applications. Using the Web-Across-the-Curriculum became the most popular training topic, even for those with little or no experience with technology. A second fast growing training topic is "Web Publishing" where individuals can develop skills and strategies for adapting course materials to the Web. To respond to the growing interest in distance learning, we redesigned our brochure from its modular format into three strands in the areas of Technology and Teaching, Distance Learning, and Putting It All Together. Each of these strands incorporates several topics. The new brochure states that, "These strands are designed to help educators develop skills and strategies for a distance learning environment." (1998, CDLR).

Theoretical Framework

The Office of Technology Assessment (OTA) issued a report on the integration of technology in our nation's schools (1995). Schools in the United States had 5.8 million computers for use in instruction, about one for every nine students. While 75 percent of public schools had access to some kind of computer network, and 35 percent of public schools had access to the Internet, only 3 percent of instructional rooms were connected to the Internet (OTA, 1995). Currently, most funds for technology have been spent on hardware and software. On average, schools have devoted no more than 15 percent of technology budgets to training. Helping staff use technology effectively may be the most important step in realizing the current and future investments in technology (OTA, 1995).

To address the lack of technology training and staff's reaction to computer technology usage, this study used two theoretical underpinnings: Diffusion *of Innovations* (Rogers, 1983) and the Concerns-Based Adoption Model (CBAM) (Hall, Wallace, & Dossett, 1973). This framework provides guidance for professional development strategies for all training settings. It is imperative that we further adopt computer technology and telecommunications as an innovation in business, industry, government, health care, etc. As more and more entities mover toward technology driven training, and follow-up studies, we must understand when and if transfer is taking place.

Rogers defined an innovation as an "idea, practice or object that is perceived as new by an individual or other unit of adoption" (1983, p. 11). Diffusion is the "process by which an innovation is communicated through certain channels over time among the members of a social system" (Rogers, 1983, p. 10). The innovation-decision process is the "process through which an individual (or other decision-making unit) passes from first knowledge of an innovation, to forming an attitude toward the innovation, to a decision to adopt or reject, to implementation of the new idea, and to confirmation of this decision" (Rogers, 1983, p. 20). This process consists of a series of actions and choices over time with varying stages. There are also influences on the process, such as the prior conditions, characteristics of the decision-making unit, the perceived characteristics of the innovation, and communication channels.

Because all individuals in a social system do not adopt an innovation at the same time, it is helpful to place individuals into adopter categories, (classifications of members of a system on the basis of their innovativeness). The innovativeness dimension, as measured by the time at which an individual adopts an innovation, can be partitioned into five adopter categories: innovators, early adopters, early majority, late majority, and laggards (Rogers, 1983).

Another adoption model, Concern-Based Adoption Model (CBAM), was developed by Hall, Wallace and Dossett in 1973. The concept of "concerns" has been described as "the composite representation of the feelings, preoccupation, thought, and consideration given to a particular issue or task. Depending on the personal make-up, knowledge, and experience, each person perceives and mentally contends with a given issue differently; thus there are different kinds of concerns" (Hall & Hord, 1987, p. 59). This model views change as a process rather than an event and examines the various motivations, perceptions, attitudes, and feelings experienced by individuals in relation to change (Hall et al., 1973). Change entails an unfolding of experience and a gradual development of skill and sophistication in use of an innovation. An individual's concerns can move in developmental progression from those typical of non-users of an innovation to those associated with fairly sophisticated use.

The theory and research of Hord and associates showed that there was a general pattern to the intensity of the different stages of concern, and that changes in this pattern can be linked to the change process as it unfolds (Hord, Rutherford, Huling-Austin & Hall, 1987). At the beginning of a change process, the typical "non-user" has concerns that are relatively high in *Awareness*, *Information*, and *Personal* (self-concerns). Non-users or low users are more concerned about gaining information about the innovation and about how change will affect them personally. As they begin to use the new program or innovation, concerns become more intense in the area of *Management* (task concerns). As a teacher becomes more experienced and skilled with an innovation, the tendency is for concerns at the lower stages to decrease in intensity while those in higher stages such as *Consequence*, *Collaboration* and *Refocusing* become more intense (impact concerns).

Concerns theory and research reveal that concerns change over time in a fairly predictable, developmental manner (Hall & Hord, 1987; Hord et al., 1987). If we can predict how concerns will change throughout the phases of the change process, we can design in-service and other intervention activities to address those needs.

The success or failure of a training innovation clearly rests with the trainers. Training programs must integrate technology very early to be effective. Train-the-trainer programs must model how to use the technology in the teaching and learning process. The idea is not only to teach them how to use the hardware and software, but how to integrate it seamlessly into the curriculum. Otherwise, it doesn't work..."(Siegel, 1994, p. 34). Thus, hardware,

software, and professional development share an interdependent relationship (Dyrli & Kinnaman, 1994; OTA, 1995).

Purpose of the Study

The purpose of this study was to determine the role of professional development and training in the adoption of computer technology and telecommunications in a training case study. Research questions included:

1. What were the percentage of concerns that were self, task, and impact of high, middle and low-using computer technology and telecommunications users?
2. To what extent did the findings match or not match Rogers' diffusion of innovation research (1983) and the Concern-Based Adoption Model (Hall, Wallace & Dossett, 1973) for innovation and diffusion?
3. What were the factors that made an impact in the diffusion process and how might these training environments further enhance professional development and interventions for diffusion?

Case Description

Calvert ISD is a good example of a complex partnership between the CDLR and a school district. The partnership includes technology planning and program development, technical support, and training for teachers, administrators and technology coordinators.

Calvert, in east Texas, is approximately half way between Dallas and Houston. It has a population of approximately 2,000 and is located about 30 miles north of the CDLR, and is 30 miles from the nearest moderate sized community. Both Robertson County and the community of Calvert are rural in nature with a farm-based economy. Calvert has no non-agricultural based industries. The nature of the terrain limits farming, so the land is basically used for grazing by food animals.

The school district has two schools and an enrollment of 333 total students. Over 92 percent of students have been identified as economically disadvantaged based on eligibility for free and reduced priced school lunches. Ethnic diversity of students is as follows: 81 percent African American, 10 percent Latin American and 9 percent European American.

The Texas Education Agency categorizes Calvert ISD as a "property poor" district and has poor physical facilities. For example, the junior high/high school building was constructed in 1920. With a small economic base and low tax income, Calvert had lagged behind other districts in implementing an effective technology program prior to 1997. Prior to 1997, technological assets at the high school consisted of 35 computers in laboratory settings, none of which were capable of accessing the Internet.

The overriding problem for Calvert students and community members continues to be the perpetuation of poor academic achievement from generation to generation. This is evident through minimal ability to meet state academic standards. The district's most serious academic deficiencies are in reading and mathematics as evidenced by scores on the Texas Assessment of Academic Skills test (TAAS). In spring 1997, only 45.8 percent of students met minimum expectations on the reading portion of the TAAS, and 38.7 percent met minimum expectations on the mathematics portion.

In fall 1996, the CDLR began providing technology planning assistance to Calvert ISD. District administrators had drafted a proposal for Technology Infrastructure Funding, and needed help in editing and refining the proposal and developing its technology component and budget. The technology planning and grant writing process involved close working relationships between CDLR staff and the Calvert superintendent and secondary principal, several visits occurred between the two sites. Calvert met the two TIF selection criteria in that more than 70 percent of its students are economically disadvantaged and the district did not have direct connection to the Internet at the time of the proposal. Consequently, the junior high/high school campus received a TIF grant in the amount of $385,000 in the first round of TIF funding.

Calvert ISD contracted with the CDLR to provide both technical support and training. Technical support included installation of their local area network and computer equipment. In addition to a fully networked laboratory, a computer with Internet access was installed in every classroom, and the principal's office. The training component included at least 10 days of teacher training, 2 days of administrator training, and 4 days of technical training. The teacher training dates were scheduled before the technology was completely installed.

Administrator training included system administration and expansion strategies as well as development of strategies for supporting teachers in integrating technology into instruction and management. Administrator training occurred in a 2-day workshop conducted at the CDLR. The Project Manager and Technology Coordinator received

at least 4 days of technical training that included skills and knowledge for maintaining equipment and software, such as routine maintenance, administrative tasks, troubleshooting procedures, and system upgrading procedures. Technical training occurred informally as needed during visits to the campus by CDLR technical personnel.

The first three teacher training engagements were completed before the technology system was actually installed at the school site. This group was very excited about receiving the grant and the administration hoped to engage the staff in training while the excitement was sustainable. Ten administrators and teachers came to CDLR for one day of initial training in May 1997. Two trainers took the group through the *Using Windows 95* curriculum. A month later, one of the trainers met with the high school principal and provided two hours of one-on-one training on Windows 95.

In July, thirteen teachers and administrators attended two days of training held in the computer lab of College Station High School. Two trainers took the group through *Point and Click (Navigating in Windows 95 Environment), Word Processing with Word 97, and Classroom Presentations with PowerPoint* curriculum. The evaluations from these sessions of training were very positive and enthusiastic, both of the program and the trainers. Feedback included comments that indicted that some participants needed to move through the materials a little slower, and all participants indicated that they needed time to practice the new skills. Evaluation and feedback from the participants remained positive throughout the training sessions.

By the scheduled August training, the computer lab had been installed in Calvert ISD. Two days of training were included in the in-service meetings just prior to the beginning of the fall semester. Two trainers took sixteen participants through a review of word processing skills and *Spreadsheets using Excel 97* curriculum. The review proved to be very beneficial, as many participants had not had the opportunity to practice skills learned in earlier training and several had not attended the previous training sessions. The group was taught how to develop their grade books using Excel software; each teacher received his/her student lists and set up their class roles. Discovering how easy it proved to be to average grades was a selling point for several doubtful teachers - this new technology system was indeed worth it!

On September 8, two trainers introduced email to seventeen participants. The system was not totally stable; therefore participants were introduced to email on Microsoft Outlook and were able to email among themselves within their own network. This training was scheduled from 3:00 to 5:00 PM after school classes had dismissed. Students were still present on the campus. This and other duties and responsibilities kept teachers from being able to focus on the training. The training team returned on September 20. By this time the system was more stable. The two trainers reviewed the email process and introduced the Internet. Participants continued to request more time on the computers to practice and explore new sites. One of the favorite web sites that this group discovered and continued to enjoy was the Blue Mountain Electronic Greeting Cards. For months following the training, the group sent each other and friends animated, on-line greeting cards from this site. Trainers received cards from the teachers as well as various requests assistance email.

Two additional trainers, an undergraduate student worker and a graduate assistant, were added to the team for the October training sessions. The team taught the participants to employ key word searches using various web search engines. The curriculum utilized Yahoo, Infoseek, AltaVista, Excite, the ERIC database, and several on-line dictionary and encyclopedia services. The afternoon was spent exploring collaborative web based projects. Using the curriculum, *Virtual Architecture: Designing and Directing Curriculum-Based Telecomputing* (Harris, 1997), as a guide, the group located and reviewed web sites that involved information exchange. It was at this point that members of the group began to experience the overwhelming amount of resources that were now available to them and to their students through the Internet.

Three of the training team members returned to Calvert during a regular school day later in the month. The trainers met individually with each teacher during his/her conference period to address specific staff development needs. Many of the teachers reported that they appreciated this individualized attention and asked questions that they were not comfortable asking in front of the large group.

In November, three trainers continued to guide the participants through the remaining two activity structures: information collection and analysis and problem solving. The session commenced with the group in a brainstorming activity, identifying powerful learning experiences. At points during the training, the participants shared with the group interesting web-based educational projects that they had reviewed and related them to the powerful learning experiences that had been identified earlier. The training concluded with guidelines to design a collaborative web-based project.

Methodology

This study used naturalistic inquiry as the methodology. This methodology allowed the researcher to develop working hypotheses and grounded theory within the context of the schools. The interview process began with the school principal and superintendent and then used the snowball sampling technique (Babbie, 1989) for suggestions of additional respondents. Site technology coordinators, technology trainers, learning specialists, external consultants, and high, middle, and low-using computer technology teachers were interviewed. All of the respondents and school levels were coded to ensure confidentiality by using a one or two letter designation and number corresponding to the type of position in the school and the consecutive order of the interview.

For this study a variety of qualitative methods were implemented to help "ensure truth value, applicability, consistency, and neutrality:" (1) prolonged engagement and persistent observation, (2) interview protocol development, (3) the interview process, (4) member checking, (5) triangulation, (6) and a reflexive journal (Erlandson, Harris, Skipper & Allen, 1993). The constant comparative method was used for the data analysis (Lincoln & Guba, 1985). This method includes four stages: (1) comparing incidents applicable to each category, (2) integrating categories and their properties, (3) delimiting the construction, and (4) writing the construction. For the first stage, the researcher studied the transcriptions and reconstructions to determine trends in the data from the varying perspectives. Each idea (unit) was initially listed without placement into categories. The investigator drew upon tacit knowledge in making these initial judgments for early category formulation.

The transcriptions were analyzed (Newlove & Hall, 1976) to give a glimpse of the individual concerns and innovation-decision process. As concerns were identified in the interview transcriptions, tally marks were made to determine percentages of concerns (self, task, and impact). Delimiting of the construction occurred as the data sources became saturated and the categories integrated.

The analysis of the interviews of principals and technology trainers provided additional insight into needed professional development strategies. This data will be discussed in the concluding sections.

Research Findings

The researcher did not pre-determine the profiles of the subjects in this study. Respondents were selected based on the nominations of their peers or supervisor, regardless of subject matter taught, total number of years teaching, and how they were trained or received exposure to technology; an 87% response rate was obtained in this study. The findings of this research are summarized into years of teaching experience, percent concerns expressed (self, task, and impact), and how teachers received their technology training/experience. The profiles of high, middle and low using teachers provide a snapshot of the use of computer technology and telecommunications.

Teachers were placed into user categories; by combining the data into high, middle and low teacher profiles, trends were more obvious. Average totals were included at the end of each user category. Notable trends were found in years of experience, percent concerns and technology exposure.

Years of experience revealed differences between high, middle, and low users of technology. High users averaged 17.5 years of experience compared with low users at 10.0. Teachers who were relatively new to the profession, but who felt comfortable in their teaching and/or technology, were most often high users.

In the areas of concerns and training exposure, concerns of **high** users were most often **impact** and **task** concerns as compared to **low** users whose largest concerns were **self**. Middle users fell in between. Specific examples of expressed concerns were used to develop the recommendations at the conclusion of this paper. In addition, training/exposure to technology showed that 11 out of 13 high users of computer technology and telecommunications had access to a computer prior to this study. Most "learned by doing" rather than courses or workshops.

Table 1

Code	Years of Subject Experience	Subject	Concerns			User of Technology		
			Self	Task	Impact	High	Medium	Low

13	19	History		☯		☯		

Conclusions

Conclusions are based upon the original research questions. In responding to research question #1, the percentage of concerns that were self were 23%, for task were 38% and for impact, were 39%. As for as how the teachers fell on the continuum of users of computers and telecommunications, 23% were high users, 46% were middle users and 31% were low users. Those responding with high concerns for self most often submitted arguments as to why they felt their positions would not ever be replaced with a computer.

In the second research question, the findings closely matched Rogers' diffusion of innovation research and the Concern-Based Adoption Model for innovation and diffusion. The high users in this study matched Roger's innovators and early adopter category by demonstrating more opinion leadership and risk taking tendencies. Higher users of technology had a more favorable attitude toward change, were more able to cope with uncertainty and risk, less fatalistic, had higher levels of motivation, more social participation, and greater exposure to communication channels. Higher users of computer technology actively sought information about training, software, and applications to the classroom and were more likely to be participating in leadership positions, such as technology or site based management teams. The middle users were more deliberate, succumbed to peer pressure and were more skeptical and cautious. The low users matched Roger's laggards with less interest, more suspicion and resistance.

The stages of concern were an indicator of the diffusion process in a different way. For example, the interactions with a person who has high *self* concerns may be quite different from those with someone with high *impact* concerns. Movement through the stages of concern cannot be forced, but, with appropriate support and assistance, can be facilitated. At the same time, a lack of assistance or the wrong kind of support can interfere with developmental changes in concerns. Concerns are influenced by participants' feelings about an innovation, by their perception of their ability to use it, by the setting in which the change occurs, by the number of other changes in which they are involved and, by the kind of support and assistance they receive as they attempt to implement change (Hord et al., 1987).

In regards to the final research question, several factors contributed to the overall diffusion of computer technology and telecommunications. The degree of computer technology and telecommunication diffusion in this case, the concerns of personnel, and administrative factors all work together in the change process. It is evident that the diffusion process is a complex, dynamic continuum, with many factors influencing the change process. By understanding the types of individual concerns and the relationship of concerns to the use of an innovation, an entity can develop a professional development model and interventions for diffusion. "Based on research with concerns-based concepts, it is clear that the day-to-day actions, or interventions, are keys to the success or failure of change attempts. Indeed, these interventions are the keys to understanding the dynamics of facilitating change" (Hall & Hord, 1987, p. 142). According to Hall and Hord, "an intervention is an action or event or a set of actions or events that influences use of the innovation" (p. 143). Intervening engages many actors who work with many targets in a variety of ways to make change happen. Formal training is obviously necessary, and informal monitoring of implementation must occur regularly.

Recommendations

Interventions must be logically related to the needs of staff and the use of the innovation. Through communication and information transfer, individuals begin to network informally about the possible benefits of the innovation. Through formal training and professional development, individuals gain the skills, knowledge and attitude to be successful with the innovation. Individuals must not only have training on the use of the technology, but on how the innovation can become a part of their training or teaching repertoire. The train-the-trainer model allows individuals to develop units and teaming with technology as a tool, not the focus (Siegel, 1995). Concentration on technology to the exclusion of human factors is a prescription for failure.

There are six distinct categories of interventions: (1) developing supportive organization arrangements, (2) training, (3) consultation and reinforcement, (4) monitoring, (5) external communications, and (6) dissemination (Hord, et al., 1987). Intervening engages many actors who work with many targets in a variety of ways to make change happen. Based on this researcher's findings and data analysis, following are recommendations for practice specific to diffusion of computer technology and telecommunications. These recommendations are listed with consideration for the human factors first. Although these recommendations are made for the school studied, implications exist for the consideration or application of these recommendations in other environments.

Interdisciplinary teams/clusters should be formed; one teacher should be placed on each team who is more knowledgeable technologically to help integrate technology throughout the team. This could also be achieved by having at least one "tech" person on each wing/hall and or content area and preferably giving that person an extra conference period to help facilitate individuals in the vicinity of the building or academic area. This enables proximity and similar interest to help infuse the technology in a non-threatening environment. The technology leader on each team should have additional training and exemplify the characteristics of innovators or early adopters (Rogers, 1983).

In-service training and college courses are still lacking and are not the solution for a quick fix! Teachers training teachers works best, but takes longest. For this school, informal training was most effective. The peer pressure and informal network of placing technology experts on each team will enable the low users to gain knowledge and skill, without becoming angry that it is forced upon them. If training is initially directed to those who are interested and motivated, these teachers can train the other teachers (and be placed on the interdisciplinary teams.

The school in this study had many technological resources. Most of the teachers are using the technology, at least for management tasks. Being a new teacher or a low user in these schools could be intimidating. Most teachers do not want to admit that they do not know procedures. There should be an orientation program for new teachers to demonstrate what resources are available and the procedures for using those resources. The new and low using teachers have more self concerns and need more support and guidance. A collegial mentor program, where a new or low using teacher is matched with a peer who is "just a step ahead of them," will allow these teachers to have many of their personal concerns addressed. This person should **not** be a technology trainer or high user, because the knowledge/skill gap is too great. It was indicated in this study that middle users act as helpers to the low users and are not as intimidating because they have recently been through the learning process. This collegial relationship needs to be non-threatening and related to the individual's subject area or managerial needs. If teachers see the benefit of saving time to average grades, or the integration of technology into an existing unit, these teachers will begin to overcome the resistance.

Diffusion and change studies can be translated into a variety of different contexts and to a vast array of innovations. With the introduction of computers in schools, there are significant changes in the school organization

and roles of the teachers, administrators, parents, and students. In order for education to institute change, it is imperative that school personnel understand the diffusion process and its implications for success or failure of innovations.

Distance Education: Examining Emerging Standards and Instructional Practice via Videotaped Content Analysis

Carmeta Tate-Blake
Palm Beach Community College

Jo D. Gallagher
Florida International University

Douglas H Smith
Florida International University

Previous research shows that traditional-type instructional strategies are being used in distance education because there has been no training to distance teach. Secondary data, however, appear to suggest emerging practices which could be pooled toward the development of standard practices to distance teach. The findings of this study revealed that of the emerging practices suggested by proponents and by faculty who teach distance education courses, few were practiced, and those practiced were used minimally.

Keywords: Distance Education, Higher Education, Instructional Delivery Methods

This study was conducted against the background that as distance education changes the landscape of education and training, traditional trainers and instructors will need to adapt or change strategies to be effective. In fact, Holmberg (1995) has noted that faculty need information about dialogue and discourse in distance education as opposed to the distribution of distance education. Charp (1998) has noted that "with all the studies and documentation available, research on why and how use of technology is effective in education remains minimal" (p. 6). As technology improves and the wave of distance education programs grows, it will be necessary to evaluate if traditional instructional delivery methods will yield the best results in distance education or whether other methods *would make* distance education more effective and even superior.

Problem Statement and Theoretical Framework

The need for this research was based on the concept widely held by experts, that distance education is different from traditional education, and that instructional delivery methods for distance education should, therefore, be different. It would appear that instructional delivery methods are key factors for effective distance education (Black, 1992; Cordover, 1996; Dillon, Hengst & Zoller, 1996; Holmberg, 1995). From the perspectives of students "talking heads prevail." Students reported in one study, that "their instructors used a variety of teaching strategies–with lecture and discussion as the two most common" (Bozik, 1996, p.99). Research is therefore necessary to examine what instructional standards exist, and how higher education faculty practices these. This study sought to answer following research questions: (a) To what extent are standard practices being followed in instructional delivery?; (b) What is the faculty's rationale for the instructional delivery methods implemented at the higher education level of distance education?; and (c) What are the factors that cause some faculty to practice more of the emerging standard delivery methods than other methods in distance education?

A number of theories informed this study. According to Keegan (1993), "distance education can be seen from the perspective of three developmental stages—correspondence, teleconferencing, and computer-based learning" (p. 17). Keegan believed that the foundation theories for distance education essentially lie in the grounded theories of general education. However, he was quick to point out, "but not within frameworks of group-based, oral instruction" (p. 66). His revised view of the theoretical approach for distance education was motivated by Peters' concept of industrialization in distance education that "from many points of view conventional, oral, group-based education is a pre-industrial form of education" (in Keegan, 1986, p. 81).

Garrison's facilitation approach has been that of "communication and learner control" (1989, p. 36). Underlying this notion has been the necessity for two-way communication and the necessity for interaction with the teacher. Garrison saw the distance learning process as a facilitated one, and technology as necessary for this interaction. He has argued that technology and distance education were inseparable and that theory and practice in distance education have evolved based on the increasing sophistication of instructional technology.

Instructional Theory in Distance Education

Ostendorf (1989) pointed out that television has been generally considered an entertainment medium where participation is passive. The challenge for the distance education faculty in higher education then has been to use a passive medium to generate action in students. She has offered suggestions such as combining lecture with a pre-distributed worksheet with intentional blanks to be filled in. "This technique is especially useful for a complex topic that would be difficult to cover in less than 10 minutes" (p. 23). Hudspeth and Brey (1985) demonstrated how visuals can eliminate the "talking head" through creative planning:

> The faculty outlined the teaching points, shot and edited several rolls of color slides that they used by projecting pictures on a white piece of cardboard in the studio (picked up by one of the two studio cameras), and prepared an excellent supplementary program on word processing. This was not a "talking head" program. Between a simple chalkboard and 35-millimeter slides, teaching points were adequately visualized and few students realized that this was a very low cost production. (p. 56)

The importance of interaction in distance teaching has given way to interactivity becoming a generic term of distance education. It is believed that for distance education to be truly effective, instructional delivery methods should be interactive. Interactivity has some limitations, however. For the most part, active class discussion is one of the most common methods, but with large groups this interactive method could become unwieldy and defeat the purpose for which it was intended. Cranton and Weston (1989) have maintained that the group should be small and probably under 30 in a face-to-face situation if everyone is to participate. Of course, for the television teacher, there should be no such thing as a group in the teaching transaction even though the instructor is aware there is 100 individuals grouped together. The medium of television caters to one in a mass at all times, which is another reason why television teaching should be different from face-to-face traditional classroom teaching. However, we believe the size of that group becomes important when instructors want to call on each student for individual feedback and in considering turnaround time for feedback on written assignments and personalized instruction. Cranton and Weston (1989) have added that the reservoir of resources which adults bring to the learning experience should be utilized. The "emphasis can be placed on discussions, problem-solving exercises, group work, case studies, role-playing, simulations and field experiences" (p. 8).

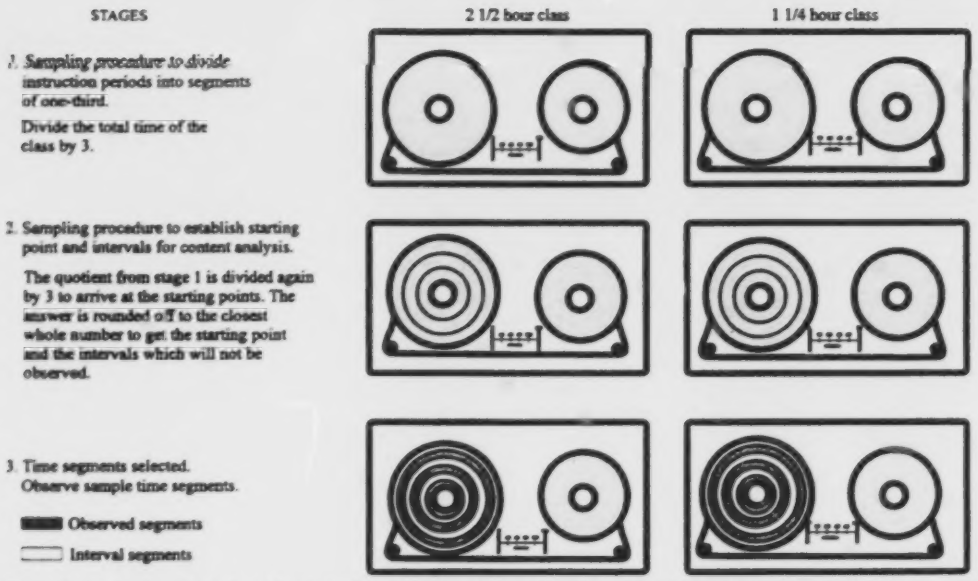
Adult Learning Theories

It would appear from the literature that there is no one theory which could singularly describe how adults learn. Gagné (1985) has suggested certain relationships, which are essential, ranging from gaining attention to enhancing retention and transfer. Behaviorists such as Thorndike (1928) and Skinner (1974) attribute adult success in learning to their ability to remember only for utilitarian reasons and through repetition. However, central to distance education must be the theory of self-directed learning. The idea of self-directed learning was anathema to the traditional pedagogy to which people had grown accustomed. It was this perception of self-directed learning that propelled both Houle (1984) and Tough (1978) to carry out studies that would define self-directed learning as another method of adult learning.

Methodology–A Content Analysis Approach

For the purposes of this study the institution and the participants were assigned pseudonyms to preserve the anonymity of both. The institution is herein referred to as Sunny University and the participants (N=5) are Ashley, Francis, Jerry, Sydney and Toni, all of whom were full-time faculty at Sunny University–a four-year traditional institution. This was a qualitative study which employed the constant comparative analysis approach of Strauss & Corbin (1990) as applied to videotaped content.

A sample of videotapes representative of all courses (Spring (1997) semester) and participating faculty (N = 5) was selected for observation and content analysis. Content analysis is not normally employed as a data collection procedure for instructional content, and, to date has not been used in distance education research. This study represented a unique opportunity to apply a traditionally media-related research technique to educational data. Cognizant of the increasing impact of media-related technologies on distance education, the researchers combined theoretical sensitivity and existing theories with content analysis to design a time-sampling technique unique to videotaped instructional content (see Figure 1).



STAGES
2 1/2 hour class
1 1/4 hour class
1. Sampling procedure to divide instruction periods into segments of one-third.
Divide the total time of the class by 3.
2. Sampling procedure to establish starting point and intervals for content analysis.
The quotient from stage 1 is divided again by 3 to arrive at the starting points. The answer is rounded off to the closest whole number to get the starting point and the intervals which will not be observed.
3. Time segments selected.
Observe sample time segments.
Observed segments
Interval segments

Figure 1. Sampling instructional videotaped content—A model for sampling time segments for content analysis of instructional material.

The rationale for observing the videotaped content in three distinct portions of beginning, middle and end was to secure a third of the actual lesson time for viewing in a way that represented different portions of the teaching transaction. The observation period for a 2½-hour class was the 17th minute to the 34th minute (rounded off from quotient of 16.66). The middle was from the 51st minute to the 68th minute, and the final portion was from the 85th minute to the 102nd minute. For 1¼-hour classes using the same sampling technique, the beginning point of observation was from the 9th minute, the middle from the 27th minute and the final portion from the 45th minute. For each faculty member teaching a 2½-hour session the total number of minutes observed was 459 minutes, and for the 1¼-hour sessions, the total was 243 minutes. This sampling technique is couched in Holsti's notion of flexibility and representativeness in sampling for content analysis. Holsti (1969) has posited that in the event that "every source is not considered equally important for the purpose of the study [that a] purposive sample may be drawn to reflect qualitative or quantitative aspects of the sources which are deemed important" (1969, p. 130). In addition, there are special characteristics for the beginning, middle, and ending portions of an educational transaction. In accordance with the research question the unit of analysis (that which is counted) was instructional delivery strategies used by faculty. The categories were adapted from Cranton & Weston's (1989) typology (Table 1) and formed the etic (analyst-constructed categories) during observation.

Table 1
Etic Categories for Coding Instructional Delivery Methods

Instructor-Centered	Interactive	Individualized	Experiential
Lecture - students passive	Class Discussion - student involvement	Programmed instruction- students receive extensive feedback; students work at own pace	Role-playing - active student participation
Questioning - encouraging student involvement; monitoring student learning	Discussion Groups - students participate in group work	Independent projects - students are actively involved assigned projects during class time	Simulation - active student participation in situational experiences during class time
Demonstration - instructor illustrates - uses examples, anecdotes, graphics	Group projects - students given assignments to be worked on in groups during class time	Computerized instruction - Instructor uses e-mail or other CAI methods of instruction	Laboratory - active student involvement in a realistic setting

Researcher as Instrument

We brought to the project some bias about what is expected in a distance education course taught via PictureTel and were the main instruments for data gathering and analysis. From a communication and teaching perspective, the feeling is that enthusiasm, personality, and a general knowledge of the medium one uses to disseminate information is essential to good teaching, regardless of the medium. From the literature and our own observations, we have learned that the majority of the instructors now teaching via distance education have come out of traditional teaching situations and have resisted major adaptations to accommodate the new medium. Because distance education is very different from the traditional classroom, it follows that there needs to be some readjustment on the part of the traditional instructor who wishes to teach via television. In this regard, we feel the distance education faculty, while expert in their content area, need to be trained for the new challenges of teaching via television.

Data Analysis Strategy

The instructional delivery methods practiced by faculty were identified and counted through observation of videotaped material of the televised instruction on PictureTel. A number of categories were named in the first round of coding. These data were identified, counted, and provisionally analyzed through interpretive analysis. In the second round of coding, we decided that the parameters for coding had to be expanded to include non-instructional strategies given the technical and administrative categories that were emerging. A further refining of categories was achieved by reviewing the samples againand, in one instance, reviewing the entire videotaped lesson. During this phase, verification of categories was the objective, and, where there was an overlapping of categories, these were either subsumed under a broader category or placed in a separate category.

Findings, Conclusions and Limitations

The majority of the instructional delivery methods practiced were instructor-centered and concentrated heavily on three major strategies: lecture, questioning, and demonstration (see Table 2). Guest speakers (3 instances observed) emerged as a category and were coded as an instructor-centered strategy. These were coded as such because the guest speakers only employed the lecture strategy interspersed with questions and demonstrations. Observed interactive strategies focused more on class discussion than on feedback or on group projects. There was no clear distinction that necessitated creating a category for discussion groups and another for group projects, as the activities almost always overlapped; therefore, these two strategies were collapsed into one category (group projects) which clearly described both functions.

Table 2.
Observed Instances and Examples of Instructional Delivery Strategies by Faculty (N=5) Teaching via PictureTel at Sunny University*

	Instructor-Centered			Interactive			Experiential	Individualized
Instructors	Lecture	Questioning	Demonstration	Class Discussion	Feedback	Group Projects	Role-play	Independent Projects
Sydney*	(7) Explanations; Talk on subject matter (2) Guest speaker	(5) Logistics Text, Instructor to student	(1) Video shown (1) Anecdote	(7) Reports, syllabus, and student to student	(0)	(2) Students talk about chapters in text	(0)	(3)
Francis*	(14) Subject matter	(13) Activities Verification	(10) Diagram video, overheads, illustrations	(1) Discussion on answers	(1)Instructor repeats information	(4) Cohort exercise, projects from Study Guide	(0)	(1)

*Pseudonyms.

What has emerged at Sunny University is corroborated with what was found in the Dillon et al. (1991) study. Also instructive in the findings of this study was that one instructor who claimed no previous teaching experience used more non-lecture methods than the other four instructors who were seasoned traditional instructors. This would seem to bear out the notion that traditional teachers need to modify their teaching to fit the distance mode. However, one important point that should not be overlooked in the data for instructor-centered strategies is the volume of questioning which instructors at Sunny University did. These data may suggest a concerted effort on the part of instructors at Sunny University to depart somewhat from the straight lecture method and to move closer to teaching for the distance mode.

Readers are cautioned not to infer that interactivity was a high point in the instructional strategies practiced at Sunny University because there were 64 instances of questioning. Questioning, while generating two-way communication, was rarely directed at distance students and did not constitute feedback, which was rarely practiced and was regarded by proponents as integral to interactivity. In fact, the data from observations showed that except for a very deliberate attempt by one of the instructors of this study, most of the questions were directed to on-site students. This would indicate a clear violation of Holmberg's (1995) claim that interactivity in a non-contiguous communication process is being able to give effective feedback and help the distance students keep track of their progress. Holmberg's claim also seems to support Zigerell's notion that "non-interactive or one-way video encourages passivity in learners" (1991, p. 64).

The analysis of these data showed that while faculty practiced some of the emerging practices recommended by themselves and by proponents, that the actual application of these emerging practices was haphazard. For example, everyone lectured, but none of the instructors made use of Ostendorf's (1989), Zigerell's (1991), and Willis's (1993) recommendation not to lecture for more than 20 minutes at any given time during the distance education transaction. The instructors did introduce interactivity by asking the students if they had any questions, but the teaching time spent on lecture far outweighed the teaching time spent in interactivity between the instructor and the remote-site students.

Rationale for Emerging Practices in Use

The in-depth interviews with the instructors illuminated several areas related to the research questions. For example, it did not appear as if they had a choice in using PictureTel. From all accounts, the university was going to attempt distance teaching and instructors were asked to participate. As Ashley stated, "Well, first of all, I was asked to present this particular course or this segment of the course; it was a new course for me. Then I was also told that it would be presented via distance learning." Ashley was not, however, enamored with the technology at all: "The information, the content being presented, can be presented via any medium, and PictureTel is just another mechanism to present the information to another area—to a distant area".

Francis, while appearing very relaxed with the technology during the presentations, also appeared to have had to embrace distance education and the technology with no previous exposure: "cold turkey. . . .I literally started off that course with little or no preparation." None-the-less, the instructors defended the instructional strategies used. Toni used a more instructor-centered approach in distance teaching and justified it, saying the approach was used "because the students tend to look for more direction."

> They say the students at the distance sites tend to be more passive than students at host sites, and what I've experienced is if the instructor doesn't take an active role in building that student participation, they become lethargic and simply watch what's going on as opposed to becoming a part. So rather than giving more freedom to the student to guide the direction and to lead the discussion, those kinds of things, I think is not necessarily good in my classes. It may be appropriate in some other classes. There is a reason for that because my students tend to be more traditional students than non-traditional students. If they were non-traditional students, more mature, more self-directed, I think then the scenario might be different. (Toni, March 1997)

Sydney articulated that PictureTel was just one element. "The method by which I reach [the students] is fairly neutral." Sydney claimed, "My subject is not teaching through PictureTel. My subject is using technology to reach the learner and to teach something to the learner to give them valuable insight." Sydney believed that the students taking the course should be self-directed and, as such, the strategies employed were appropriate.

> My teaching method is based on student participation, discussion, case studies, and also it implies that you have to have more graphics when you teach, and this is not always what people do. So, I have to prepare

> graphics. I have to prepare slides that they will be using, and that I will be using to show them some of the things I want to tell them. So you have to be visual and auditive as well. You can't be only auditive. (Sydney, March 1997)

Jerry recognized that the intimacy of the traditional classroom was no longer available to the distance teacher and was compelled to adopt the strategies that would allow for ultimate control of this new classroom:

> I have the feeling that I need to use more graphics, more images, and I don't know why in distance learning do I need more images if they're really the same, you know, but it's just something that comes out from within me. I feel that it's the right thing to do, you know, probably. Now that I think about it, it's probably because I want to have, like, double safeguards. Before, I could just talk to a class and if something wasn't too intelligible to them, then it's very simple to just switch and do something else on the board. But since we have this tenuous connection already, I guess I don't want to mess up. I want to be doubly prepared. (Jerry, March 1997)

Jerry made no apology for not using a learner-centered approach in teaching via PictureTel. This instructor made reference to conducting several group discussions in a face-to-face situation but noted that the lack "of confidence in this equipment" would cause problems of control of the class from a distance. To Jerry, control was an important part of the teaching equation; Jerry affirmed, "I haven't used the learner-centered approach at all." The instructor took the justification further:

> Theoretically I could [use a learner-centered approach] but I'm worried about the control. You know, when you have this group of students up at the front and the others are sitting back there making faces and I can't see them. . . things get out of control at the [remote site]. (Jerry, March 1997)

Factors for Differences in Use of Emerging Practices

The data generated from observation of videotape and in-depth interviews revealed the following findings as major factors accounting for the differences in use of emerging practices: time constraints; subject matter; student type; experience; technology used; personality; competence with technology; philosophy of distance education; and adapting for distance education. With Francis there was a pacing problem; questions coming from the distance site indicated that students were concerned about the speed of delivery. As a matter of fact, Francis said there was a lot to be grasped in the courses: "[The courses] are laying out the framework, the basic knowledge-based concepts, theories, definitions, history, philosophy and so forth upon which the field is based." However, even with that thinking, the proponents of distance education have maintained that instructors teaching via television must pace both content and delivery to accommodate the separation factor in distance teaching. As Willis (1993) has said, "The pace should be slower for new material and faster for review. . . .Diversify and pace course activities and avoid long lecture" (p. 107).

Jerry wrote extensively on the chalkboard. The instructor insists that because of the subject matter, putting the matter on overhead projection would not be the same: Zigerell (1991) has suggested that the television screen might not be the best place for displaying material written on a chalkboard. "It [meaning the television] is not good, for example, for displaying illustrations and graphics that require wide eye span" (p. 64).

All five instructors had to prepare more for distance education classes than for their other classes and all believed that if the technology did not fail them so often, the experience would have been more worthwhile for everyone. As Jerry put it, "It's not distance learning; it's the equipment."

Conclusions

We concluded from the data that emerging standard practices (identified in the literature) were used minimally, and that traditional lecture was still dominant in distance teaching. Dillon, Hengst, and Zoller (1991) support these findings. In their study they found that two-thirds of the courses taught were instructor-centered strategies. A more recent study, (Cordover, 1996) while not examining instructional strategies of instructors, concluded that traditional instructors needed training to perform successfully in the distance education environment. Emerging concerns evolved from a large section of emic (that is units discovered rather than imposed) data. It can be concluded that faculty are genuinely concerned about enhancements to the technical system, and general improvements in distance education delivery at the institution. While expressing doubts about the "distance" factor in the program, they

recognized that PictureTel and the operation between the originating sites and other campuses within the same state was a small part of a larger goal for the institution.

Limitations

The researchers never anticipated that technical problems would be an important intervening variable in the distance education transaction. No accommodation in designing research questions for this study was geared to addressing how the effectiveness of the technology being used could play a role in the instructional delivery methods of the instructor. Although previous research has acknowledged that technical failures during the educational transaction are not uncommon, it would seem fair to conclude that if the occurrences are frequent, this would increase the transactional distance in distance education and result in negative experiences both by faculty and distance students. Faculty also appeared to create their own downtime in introducing administrative matters during their most captive audience time exceeding durations of ten minutes in some instances.

Although limited in scope, the data from this study can provide insights to faculty that are or intend to teach via the television medium. Further, while the results of this study should not be generalized beyond the population of the study, the findings and recommendations of this study give rise to new theory for greater understanding of the phenomenon studied. Prior research has indicated that training is essential for transitioning traditional instructors into the realm of distance instruction and the data from distance education faculty at Sunny University have validated this finding.

Recommendations for Practice and Research

Lecture is a good method, but in the distance education environment, the voice, the person and personality take on more meaning than in the traditional setting. The instructor has to essentially relinquish the old way of thinking and mentally prepare to be on television. Scripting takes on special significance geared toward talks of 10-15 minutes rather than lecturing for hours. A study guide appears to be the "Bible" of distance courses as it provides the distance students with something concrete containing the objectives, activities and expected outcomes of the course. Ongoing faculty development is critical, as the changes and advances in technology are rapid. Further research should be done to compare the effects of traditional techniques and distance education emerging practices on learning.

Critical Components of Distance Education Partnerships between Two-year Colleges and Business and Industry

Edward "Ted" Raspiller
Texas State Technical College

There is a lack of planning data that can be used by two-year college administrators and training program practitioners in developing, funding, and monitoring partnerships in distance education environments. The goals of this multiple case study were, (1) to identify critical characteristics of program planning, funding, evaluation, and policy development in distance education partnerships and (2) to create the framework for a program development model for the planning and refinement of distance education training programs.

Keywords: Distance education partnerships, Distance education policy, planning, & evaluation

The future role of continuing education programming provided by two-year technical and community colleges is filled with questions and speculation (Gross, 1995). Demographics and instructional technologies are changing and distance education will affect their future, but the extent of which is unknown. Two things are clear: (1) the need for continuing education, especially in business and industry, is greater with the current transition from an industrial to an information society than it has ever been in the past and (2) financial resources are scarce in higher education and are constantly being divided to cover the costs of more and more services (Gross, 1995).

For a number of two-year college systems across the nation, especially those in western states, answers have been found in the development of an aggressive distance education program (Western Interstate Commission for Higher Education, 1983). Distance education is not a new concept. In fact, distance learning is as old as correspondence education--an arrangement that has provided learning for thousands of students in many parts of the world. In the face of economic constraints, political pressures, and technological developments, interest has developed in formalizing arrangements between universities, colleges, and other agencies to become partners in distance education (Konrad & Small, 1986). To help defray costs associated with developing and maintaining technologically advanced distance education programs, several two-year institutions in the United States have developed partnerships or consortiums with other public institutions as well as private-sector partnerships. An added benefit has been the enhanced quality and quantity of the continuing education training programs they can offer.

The use of technology in training has grown tremendously over the past several years--tools have improved and produced several important changes in the way training has been designed and delivered (Haag, 1993). Although not every organization has implemented these new design and delivery systems, the number of organizations using them has increased significantly. A 1995 survey of organizations of more than 100 employees indicated that 48% were using computer-based training, 27% were using multimedia systems and 43% were using some type of distance learning system to deliver training (Industry Report, 1995).

The use of technology-based delivery systems in the training process has many potential benefits for organizations. For example, the use of computer-based technology in the design and delivery of training can result in greater learning gains, more consistent and acceptable job performance, enhanced cost-effectiveness and greater flexibility regarding time and locations of training (Hannum, 1990). Technology can also help address the needs of geographically dispersed trainees and reduce the need for classroom facilities (Perlstein, 1993). With the advent of globalization, more and more trainees are instructed through satellite delivery systems and computer-based software and training systems. Barriers are often present in organizations that inhibit the successful integration of distance learning technologies. These barriers may include high costs, lack of management support, lack of trainer skills, failure to adequately identify needs and to analyze financial benefits of distance learning (Gery, 1994). If two-year community and technical colleges are going to continue to be worthy training partners for globalized organizations in the next millenium, they must understand the barriers organizations face in integrating distance education programs. Furthermore, two-year community and technical colleges need to be able to provide proven planning and adoption models to help organizations overcome these barriers.

Distance Education in Texas

In 1995, the 74th Texas Legislature passed "The Telecommunications Act" (House Bill 2128, 1995), and with it set aside $150 million in annual funding for telecommunications over a ten-year period. This money has been designated to fund grants and loans, with a priority given to distance education and the collaborative efforts of schools and universities (Texas Department of Information Resources, 1995). Another way the Texas state leadership demonstrated a commitment to distance education was through the development of a Distance Learning Master Plan for Higher Education (Texas Higher Education Coordinating Board, 1996a).

Higher education leaders in Texas also addressed the use of new technology as an integral part of the curriculum. The Texas Higher Education Coordinating Board's (1996b) *Guidelines for Instructional Programs in Workforce Education* made specific reference to advances in professional development and multimedia. Specifically, the Coordinating Board guidelines stated that, "All institutions shall demonstrate promotion of teaching excellence by implementing professional development activities for all part-time and full-time faculty." Such activities include "new technologies and curricular applications and the use of technology / multimedia / telecommunications in instruction" (p. 8).

As justification for the above guidelines, the Texas Higher Education Coordinating Board (1996a) had found that more institutions were participating in distance education than ever before. The Coordinating Board surveyed the state's 166 higher education institutions and found that, during the 1993-1994 school year, 50 of those institutions offered courses for credit via instructional telecommunications. They added that this trend was expected to continue and that the growth rate should accelerate. The Coordinating Board cited two primary reasons for its support of the pursuit of distance education: (a) to meet the needs of the under-served population and (b) to increase course offerings in disciplines designated as occupational shortage fields. Additionally, since Texas is geographically the second largest state in the United States, distance education systems are critical to transcend the geographic challenges, especially in the western half of the state.

While Texas would not be considered the leader in distance education programs, certain universities and two-year colleges have developed some rather sophisticated distance education programs. The most remarkable programs, in terms of breadth of programming and number of students served, are those in the three schools that were studied for this research.

The Texas Higher Education Coordinating Board's (1996b) *Guidelines for Instructional_Programs in Workforce Education* designates the two-year community and technical colleges as the primary providers of workforce development programs. It is a natural consequence that those same institutions take a leadership role in distance education partnerships with private business and industry. It was the intent of this study to identify, research and report specifically on those types of partnerships.

According to Hall (1996, p. 45), "distance educators [in electronic or virtual universities] need to forge new partnerships with the traditional university and collaborate in creating new systems, academic course software, and supporting networks for information transmission." In addition to these partnerships, distance educators need to forge partnerships with private-sector entities to ensure program vitality in the areas of effective communication processes, transmission systems, state-of-the-art technologies, and adaptive networks. These processes and systems are necessary to guide the development and delivery of courses and programs to meet the education and training needs of a global society.

Problem Statement

Substantial research has been done in the field of distance education that relates to developing, delivering, and evaluating individual courses as well as profiling distance education students (Willis, 1994, Gooler, D.D., Firestone, C. M., & Clark, C., 1992, Niemeyer, D., 1985). *There is, however, a lack of planning data that can be used by two-year college administrators and program practitioners in developing, funding, and monitoring partnerships in distance education environments.* The primary goals of this study were, (1) to identify critical characteristics of program planning, funding, evaluation, and policy development in distance education partnerships between public, two-year colleges and business and industry in Texas and (2) to create the framework for a program development model for the planning and refinement of distance education partnerships in two-year college continuing education training programs.

Research Questions

This study attempts to identify procedures and practices related to four critical components of any distance education program partnership (Eastmond, 1994), especially training partnerships between two-year colleges and private business. The following four components and questions of inquiry guided this study:

- Program planning: How was the need for this partnership determined? How were decision-making and planning committees formed? How was equal input sustained from all stakeholders?
- Program funding: How was the program initially funded? How is it currently funded? What plans have been made for future funding?
- Policy: Were policies in place to allow for distance learning activities? What were these policies and what changes were necessary to allow for the partnership? What new policies were developed and by which partners?
- Evaluation: What evaluation practices and tools have been developed to capture and reflect the benefit(s) of the partnership for each institution and its students?

Methods of the Study

The design of the study incorporated a multiple case study approach that included interviews, document reviews, and observations as the primary methods of data collection. The three cases selected for this multiple-case study were distance education partnerships between public two-year colleges in Texas and at least one private-sector business or industry. The following considerations guided the selection of each case:

1. The three programs selected represented a variety of two-year institutions and/or a variety of private-sector businesses or industries.
2. The programs selected represented a variety of student/learner populations and/or geographical demographics.
3. The partnership selected were a current practice at the time of investigation (programs in planning stages could be considered).
4. Curricular offerings of the partnerships were delivered via distance learning technologies that included: (1) two-way audio and/or video transmission utilizing microwave, fiber-optic, satellite transmissions, etc., (2) the Internet.

For each case, interviews were conducted with the program administrator from the two-year college, the training representative from each company, and at least one instructor from each program. Program planning documents, evaluation tools, contracts and policy statements were the primary documents reviewed in each study and the researcher observed planning meetings and/or actual training classes at each site. Upon completion of data collection activities, the data from each case was closely examined to identify emergent themes.

For this study, a process of coding and comparing information known as thematic analysis was utilized to achieve data convergence. "Thematic analysis is a process for encoding qualitative information. The encoding requires an explicit 'code'. This may be a list of themes; a complex model with themes, indicators, and qualifications that are causally related; or something in between these two forms" (Boyatzis, 1998, p. 4-6). To make results from qualitative research accessible to others, one must employ different ways of organizing and presenting them (Miles & Huberman, 1984). Thematic analysis allows the application or use of qualitative information in a manner facilitating communication with a broad audience (Boyatzis, 1998). This multiple case study utilized a process of thematic analysis for the purposes of coding data and identifying cross-case themes.

The cross-case analysis utilized the 'thematic code analysis' process (Boyatzis, 1998) which resulted in the identification of common themes in the areas of program planning, policy, funding, and evaluation in each of the three cases studied.

An audit was conducted at the conclusion of the cross-case analysis. The audit consisted of a review by an external reader of all data including interview tapes and transcripts, researcher's field notes, documentation of the theme and cross-case theme development process, and the written report of the research.

Conclusions

The two-year college movement has been filled with adversities as well as opportunities. Access and affordability are the hallmarks of two-year colleges' appeal to students, while flexibility and focus on practice, as opposed to research, are its appeal to business and industry's training needs. Successful colleges in the distance education arena will be those institutions that continue to nurture these current trademarks while continually working to integrate the advantages of a more flexible delivery format.

As with traditional programs in higher education, effective distance education programs include comprehensive program planning activities and program policies that monitor internal institutional activities as well as intrastate and interstate developments. Also, to continue to appeal to their business and industry partners, program administrators at two-year colleges will have to develop sophisticated comprehensive program evaluation tools and methods similar to those used in other private-sector training programs. These tools and methods are applied to measure the impact and quality of distance education based training programs.

High-tech communication equipment, the heart of most distance education course delivery, is being improved at an escalating pace. If two-year colleges cannot develop methods to integrate new developments, their corporate partners will be forced to seek out those institutions, public or private, that can offer state-of-the-art delivery technology.

Overall, program administrators in two-year colleges are facing the challenges of distance education everyday and very little literature exists to help them through the steps of program planning and development. The following emergent themes are intended to assist program personnel in decision making and planning tasks associated with distance education programming with business and industry.

Program Planning for Distance Education Partnerships

Distance educators need to forge internal partnerships with traditional programs to create new systems, academic course software, and supporting networks for information transmission (Hall, 1996). In addition to internal partnerships, distance educators need to forge partnerships with private-sector entities to ensure program vitality in the areas of effective communication and transmission systems, and state-of-the-art technology. External partnerships will also help ensure sufficient networks to guide the development and delivery of courses and programs to meet the education and training needs of a global society. In each of the three cases studied, the college administrators initiated the discussion of utilizing distance learning technologies. In case study three, initial training discussions began in the economic development department and were later referred to a distance learning program that was housed at a different campus. This reinforces the notion that effective internal communication and cooperation are critical components of distance education partnerships.

McGill & Johnstone (1994) identified seven considerations for successful cooperation in instances of local, community college-based partnerships. Five of those considerations were reoccurring themes in each of the cases of this study: needs assessment, support from top level officials, consideration of staffing and funding needs, and the inclusion, maintenance, and nurturing of all program members.

In one of the three cases studied, the Concerns Based Adoption Model or CBAM (Hall & Louchks, 1979) was used to introduce the idea of distance education to company representatives. While this is not the only means for introducing a new concept, the CBAM process includes the early involvement of all program stakeholders. This issue was a critical, and sometimes missing, component of each of the partnerships in this study.

While a great deal of the planning was done informally between partners, specific aspects of the planning needed formal documentation. Programming logistics in each case were recorded and distributed to stakeholders in each of the three cases. This not only ensured consistency in planning details and information sharing, it was a critical communication tool for accommodating unknown or last minute changes.

Overall, in each case the college was the partner with the background in distance learning and consequently was the partner that introduced and nurtured the company through the design and delivery process.

Program Policy

As noted by Dively (1987), higher education policies and regulations were adopted long before educational technology became a major issue. Some of these policies will not be affected by the growing use of technology. In many cases, the use of technology can be accommodated with minor changes in policy and procedure. With the exception of a minor change in the college registration policy at the school in case study one, no policy changes were necessary to accommodate distance learning partnerships in the two-year colleges included in this research

study. It should be noted that each of the three training programs were non-credit and were under the jurisdiction of continuing education. Traditionally, continuing education programs in institutions of higher education operate with a great deal more flexibility than those in regular credit programs.

Each of the three companies studied had training policies that allowed employees to participate in continuing education programs. The policies typically included time off from regular work assignments to participate in company required training and reimbursement for tuition and related expenses upon successful completion of each course. No company in this study could document changes in current training policies that had evolved from worker participation in a distance education training program.

Based on the partnerships studied in each of these case studies, one may assert that distance education programs will continue to be effective alternatives to meeting workforce training needs. However, meaningful telecommunications policies need to be developed at the local, state, and national levels. According to Gooler (1991, p. 15-17):

> Good telecommunications policies are those which make it possible and feasible for educators to take advantage of the instructional and administrative powers of telecommunications technologies while reducing the risks and costs associated with being involved. Good telecommunications policies make the telecommunications systems as flexible as possible so that teachers and learners can determine appropriate usage. Good telecommunications policies open avenues for more regional and national cooperation among educators and learners rather than impose boundaries to such cooperation. Good telecommunications policies promote equity in access and quality of product and services through telecommunications.

Program Funding

Distance education systems were assumed to be a panacea for relieving higher education of traditional constraints of time and space. However, distance education has suffered from different shortcomings and restraints that have made it difficult to operate (Hall, 1996). One problem is the increasing cost of quality distance learning technology. The economic requirements to purchase and maintain the delivery equipment are very different from conventional teaching. As technology improves and user demands become more sophisticated, the traditional structures of classrooms are no longer viable tools (Gaspar & Thompson, 1995). Also, without adequate avenues for initial and ongoing funding, many distance learning systems may fall victim to outdated technology and unreliable telephone and data-transmission services.

Program administrators in each of the three case studies expressed many of these same financial concerns and were well aware of the impact that outdated technology can have on distance education programming. While in each of the three cases the company was responsible for a majority of the financial costs, program administrators in case study one and two had already utilized external funding sources to purchase equipment and to cover some training costs.

The incentives for cooperation in distance education programs are many (Willis, 1994). These three cases indicate that there are and will continue to be many financial incentives for developing and nurturing distance education partnerships between two-year colleges and business and industry.

Program Evaluation

A majority of the tools used to evaluate distance education programs are strikingly similar to those used to evaluate traditional programs. Eastmond (1994) suggested choosing a qualitative evaluation strategy that included the instructional materials, the instruction, and the overall program. Each of the program administrators and business and industry representatives in these cases indicated that the evaluation instrument included a fourth area of inquiry: the quality of the delivery technology.

Kirkpatrick (1996) postulated that the evaluation process must include evaluation at the individual and systems level to include all stakeholders in the program. Program and training effectiveness must be evaluated for individual students as well as for overall return-on-investment for each partner. A system designed to allow for both formative and summative evaluation will allow for continuous improvement and program modification.

The three companies involved in this research had designed their training evaluation around Kirkpatrick's model of four levels of program evaluation. Each of the two-year colleges in this study used more general evaluation tools. This disparity between partners led to a rather lengthy process of refining evaluation instruments in order to provide the companies with evaluation results in a usable format. In one instance, two evaluation forms

were completed by program participants. This study indicated that program evaluation components and instruments need to be discussed and agreed upon by all partners prior to commencing with training activities. Given the prevalence of its utilization in the cases studied here. it may behoove two-year college program administrators to become comfortable discussing and designing evaluation instruments based on the Kirkpatrick model.

Summary

Data collected in each of the three cases indicated that ongoing communication in and among each of the partners is a critical component in distance education partnerships. Furthermore, inclusion of program stakeholders from each partnership in the planning and implementing of the program is a critical step in creating and maintaining successful partnerships.

Especially in case studies one and three, another critical component was the prior expertise of college administrators in utilizing distance learning technologies in the delivery of training programs and courses. This previous experience proved to not only be useful for internal marketing, but it also appeared to be useful in the external marketing of distance education as a viable delivery format for business and industry training programs. Finally, it was the feeling of many of the administrators, company representatives, and instructors interviewed in this research project that one of the major strengths was the partnership itself. Whether it is for the influence of previous experience, financial and other resources, or simply to keep college faculty and administrators in tune with the workforce development and training needs of the private sector, distance education partnerships need to be initiated and nurtured in two-year colleges.

Implications

Existing research suggests that distance education will continue to play a vital role in the delivery of workforce training and effective partnerships will be a major component of its success (Hall, 1996). This study explored critical components of distance education partnerships between two-year colleges and businesses and industries. Very little research has been conducted to assist program planners and administrators in the actual development of distance education programs. The results of this study present an organizational framework for distance education program planning that can be utilized by administrators and program planners.
The organizational framework that evolved from this study has potential utility. However, there are a variety of additional areas of inquiry that need further research. The program administrator in case study three articulated it best when he remarked:

> The account manager from our economic development department and I have been looking for a planning model to follow to put this type of training together. So far, we have not been able to find one anywhere.

While none of the partners in the cases studied during this research had to make significant policy changes, there is clearly a need for comprehensive policies in the realm of distance education. The challenge to federal and state policy makers, as well as program administrators in two-year colleges, is to continue to make distance education policy that will enable institutions to meet private-sector training needs and not force viable training programs to fall victim to unnecessary bureaucratic processes.

As stated earlier, a notable challenge is determining a funding method that can provide start-up monies as well as adequate funding for ongoing system enhancements and upgrades. The partnerships studied in this research provided evidence that there are federal, as well as state-level, revenue sources available in Texas to start programs. The challenge to legislators will be to keep these revenue streams funded to foster new programs as well as maintain existing programs. The success of training programs is measured in part by effective program evaluation tools. This study indicated that the integration of evaluation results is a critical factor in the ongoing success of distance education partnerships. While it may be unique to this study, each of the three companies used Kirkpatrick's Four Levels of Program Evaluation Model. None of the three colleges in this study used Kirkpatrick's model, which led to inconsistency when each partner attempted to make program changes that were based on evaluation results. To streamline the critical step of integrating evaluation results, a detailed discussion of program evaluation tools and methods should be conducted between partners during the initial stage of program planning.

Distance learning technology is a viable delivery method that can benefit from further research concerning distance education partnerships. In addition, further research is needed to refine this organizational framework so it can continue to serve as a useful planning tool.

Collaborating in Public with the Opposition": A Study of the Complex Meaning of Learning in A Cross Boundary Work Group

Marjorie H. Carkhuff
Educational Strategy Consultant

The primary purpose of this study was to determine the meaning of learning for participants while working in a cross boundary work group. This study presents evidence that great personal, professional and team member learning was foundational to the work experience and reciprocal to collective team and organizational learning. These findings propose use of cross boundary work groups as a process for facilitating learning integrated with and parallel to solving problems in the multi-organizational workplace.

Keywords: Learning, Work Groups, Cross Boundary

A challenge all organizations face is to achieve their goals in a rapidly changing business environment and at the same time maximize employee potential. As work organizations and the work they do becomes more complex and competitive the decisions and actions of individuals are within a work group context. Teams are the focal point of how organizations are engaging in learning tasks through strategic planning, process improvement, or developing and improving new services (Gray, 1989; Parker, 1990, Brooks; 1992, 1994). Problem solving in teams has gone beyond organizational walls to accommodate the nature of today's business problems. Staffs cross boundaries when they work as groups of individuals assigned either short or long term to solve a problem through collective discussion and inquiry (Watkins & Marsick, 1993). A cross boundary work group is the explicit heterogeneous, either/both in work roles or organizations, mix of adults engaged to participate in the above stated activity (Carkhuff, 1996). Given the nature of today's workplace wherein work often occurs cross organizationally there is a need to understand the potential for such cross boundary work groups as processes for facilitating real-time learning while solving organizational problems.

Problem Statement and Theoretical Framework

One of many workplace environments undergoing work reorganization is health care. This particular industry is in the process of redesign and upheaval due to the impact of managed care. The missing element in most health care delivery systems is a virtual lack of integration of these components (Tapscott, D. & Caston, A., 1993;Witt, Kieffer, Ford, Hadelman, & Lloyd, 1993)

The health care work environment is shifting from within institutional walls to working with the extended or integrated delivery system of care that spans across geographic regions and across organizational lines. This creates particular challenges from a human resource perspective for the preparation of staff and the possibility of utilizing this forum as a learning experience for personal, professional and organizational benefit. From particular studies in the literature regarding learning as a collective team activity there is focus on the adult learning process (Dechant, Marsick, & Kasl, 1993); notion of dialogue in collective team learning (Cicourel, 1990; Dixon, 1994); capture of reflective and communicative behavior (Purser, Pasmore &Tenkasi, 1992); distribution of formal power to individual team members and the collective team-learning outcome of productive useful new knowledge (Brooks, 1994); and a study of factors affecting group learning with a distinction between learning and task in relation to group purpose (Marsick & Kasl, 1997).

Due to the extensive literature regarding teams and learning I investigated scholarly critique to provide direction for study. Suggested areas for research was: (a) should be conducted to examine team learning within different contexts; (b) teams that reflect on, critique and develop strategies to change organizational structures and policies; (c) organizations that have the intention to change unproductive ways of organizing themselves for work in organizations, (Brooks, 1994) and (d) research needs to be carried out with groups in their natural context rather than artificially constructed groups in laboratories (Hackman, 1987; Goodman, Ravlin, & Schminke, 1990). This study addressed these research needs in the following way: (a) within the natural context of workgroup activity rather than artificial; (b) chose a cross boundary work group that was charged with improving the way in which care is delivered to a population of patients to maximize impact; and (c) examined a work group that developed new protocols.

Theoretical Frame

Traditionally, workplace learning was thought to be basically instrumental or learning from one's own experience, which could lead to a repetition of mistakes (Argyris & Schön; 1974; Watkins & Marsick, 1993; Argyris, 1994; Brooks, 1994). Today the ways we make meaning of ideas, distribute privilege and power, are held accountable to validity testing through rational dialogue. Communicative or dialogic learning is explained as achieving coherence, a critique of relevant social norms, cultural codes and a critique of the assertion itself. As such, meaning is validated through critical discourse, and each item of relevant information becomes a building block of understanding (Mezirow, 1996).

I looked to the reflective learning theory literature to provide a foundation for the study. By definition the focus of reflection is not a purely internal thinking process, but also involves action. What gives reflection its' character and significance is thought-in-action immersed within a context. The process of reflection and critical reflection helps us to adjust the distortions in our beliefs, and our errors in problem solving (Schön, 1985, 1987; Mezirow, 1991, 1996).

Within a work group context, reflective learning becomes generative of new thinking as members challenge one another's thinking, reframe their perspectives, and build on integrated perspectives to construct new knowledge (Mezirow, 1991; Marsick, Dechant & Kasl, 1993). Learning through critical reflection provides a transformation of personal frames of reference, and can be described as a "holistic" blend including personal development, work related knowledge, and skills (Marsick, 1991, p. 24). Research tells us that reflection and action promote inquiry, that aspects of adult learning process such as framing, reframing, experimenting, crossing boundaries, and integrating perspectives are characteristic of the collective team learning process (Dechant, Marsick & Kasl, 1993; Brooks, 1994). The purpose of this study is to add to our understanding of a particular type of team learning environment, cross boundary work groups, to investigate the links between individual learning and collective team learning

Research Questions

The main question for the study was: What are the meanings for participants while working within a cross boundary work group? To guide the study I sought sub-questions as research indicators from the studies in current literature to see how the emerging data compares using an adult learning lens. These sub-questions were used in comparisons after the first interview during the observations and prior to second interview questions during the data collection and analysis procedures.

The sub-questions and their connection to the literature are: (1) How do the participants perceive their assumptions about learning affect collective work group learning? This question comes from the reflective learning theory base (Mezirow, 1991, 1996) in the form of open-mindedness, reflection to test and refer back to assumptions, interpret the unfamiliar relate to a meaning perspective, probing for assumptions, values, and beliefs. (2) How does the group share knowledge and ideas? Interactive team learning processes revolve around collective thinking and action. This question stems from the Team Learning Open Systems Model (Dechant, Marsick, & Kasl, 1993) in the form of framing/reframing perceptions, experimenting, crossing boundaries, and integrating perspectives. (3) How do differences in formal power distribution between individual work group participants affect the meaning for participants? Collective team learning process requires team members to carry out both active and reflective work, and communication is essential. This line of inquiry stems from Team-Learning Process Model (Brooks, 1994) looking at active and reflective work, leadership style, and power level.

Methodology

The qualitative, phenomenological method was selected as the appropriate methodology to support the investigation of meaning or how the participants interpreted and made sense out of their work group experience (Bogdan & Bilken, 1982; Denzin & Lincoln, 1994). The setting for this study was natural and the key instrument was the researcher. As the researcher I was concerned about the process of the group experience, of what this experience has become for the participants, and what has changed for them because of this cross boundary work group experience (Bogdan & Bilken, 1982).

Study Population

The particular cross boundary work group called the Diabetes Awareness Team, or DAT, was selected based on the criteria of an effective group (Goodman & Associates, 1986) and was comprised of a collection of eleven participants from four competing health systems and one business setting covering a geographic region of patient care. The participant mix ranged from four to over twenty-five years of work experience and included all members of the work group. Their roles were as follows: Diabetic Nurse Educators, Home Health Nurse, Pharmacist, Rehabilitation Specialist, Health Promotions Administrator, Business Executive, Community Health Workers, and a Staff Development Specialist. The participants included nine Caucasian members, one African American member and one Latino member. They were charged by their respective organizations to work together to improve the health status of the diabetic patient population assessed to be at risk within their particular geographic region of care (Smith, 1994). The health care organizations and the professionals had a history of turfism regarding caring for the diabetic patient to protect their respective market share. The goal of the DAT was to improve the diagnosis, reduce complications and cost of treatment for the patients with diabetes across the region through education, collaboration and partnering as organizations.

Data Collection and Analysis

The data collection was divided into two phases. Phase One included: a) pilot interview and subsequent refinement of the interview tool; b) the initial sixty minute interview regarding social-biographical information, past work group experiences, and a problem solving critical incident (Flanagan, 1954;Ericsson & Simon, 1980); five work group observations with field notes; and document analysis of all agendas, reports, and meeting minutes. I focused on gathering information from the participants utilizing the elite interviewing technique prior to their work group experience to investigate the meaning of their experiences regarding previous problem solving, past work group experiences and their assumptions about working in groups as well as the role of the facilitator and group members (Dexter, 1970; Maxwell, 1996) The problem solving critical incident exercise gave a snapshot of their past experience in learning. The main concept from each interviewee's critical problem solving incident was extracted from the data and verified through the member checking process. This data provided a foundation to understand the background of the DAT work group members, their assumption base and the meaning of past problem solving.

I attended all work group meetings over the six-month period and took field notes attending to recording observed behaviors on the activities and work of the individual members and the group as a whole. I related this to the initial interview information to validate information gathered, and to plan for clarification and additional questions based on the observations during the Phase two interview. The use of sub-questions was employed to provide an understanding of the data links to the literature utilizing the adult learning lens. I collected records, i.e., agendas, reports, meeting minutes, of the DAT work group to provide another data source to compare with the interview and group observation data. Data were analyzed from all Phase One data, using member checks and triangulation of data sources.

At the conclusion of the five work group sessions I conducted the Phase Two ninety-minute interview with all eleven participants, focusing on the work experience and problem solving in the DAT as experienced and told by the interviewees. In order to understand how they organized interpersonal and intrapersonal experience, real-life situations were elicited by having the interviewee respond to eleven index cards that listed a concept or idea involving learning while problem solving. The interviewees were asked to respond to these ideas and concepts as it applied to their work group experience. They were also encouraged to complete blank concept cards with any other concepts that were offered based on their work group experience. These reactions provided data to further explore the interviewee's underlying principle of meaning-coherence (Patton, 1990). Questions were asked to clarify observations and to draw out their stories.

All Phase One and Phase Two data were analyzed in light of the multiple data sources. Data analysis was a continuous process in that I analyzed data as I gathered it, adjusting and expanding the observation and interview strategy. I identified meaning units, coded the data, organized it in logical patterns identifying categories and constructed themes. I completed matrices to display relationships, and generate concepts for exploration. I verified authenticity of the data analysis through the triangulation and use of multiple sources (Lincoln and Guba, 1985), corroborated through member checks and peer review. I discovered patterns of belief as defined by the participants, and through thick, rich description provided a holistic picture of their experience in the DAT.

Results, Conclusions, and Limitations

The overarching theme from the participants whole work group experience was the essence of learning as a dynamic and complex system. The nature of learning as described by participants was a story based on their prior assumptions of what a work group should be, how learning had meaning for them, roles of the facilitator/leader, and member's own roles and responsibilities.

Major Themes

What was different for each of these members was the positions they held and the role that position played in their home organizations. I observed a unification of purpose in all work group meetings that transcended the competitive advantage or disadvantage. The membership valued expertise and freely networked with one another and provided insights into their home organizations, and shared knowledge and expertise. For example, the members shared with me that they regarded the experience, background, and knowledge that each member brought to the table regardless of their organizational representation, their job role with the organization and their source of expertise. This valuing of expertise was related to the perceived value to the impact of problem solving for the improvement of patient care for the regional population. The member's experiences of working together and learning while participating were integral and interwoven events, a dynamic system of inter-related parts that influenced each other.

Personal Learning

The notion of personal learning was fundamental to the experience of the DAT members. This learning included development from learner to educator in the group, growth through self-expression, self-discovery through the application of new knowledge gained in the group, growth in their willingness to link thinking and action to people and organizations, learning to change orientation from a loner to a collaborator, and shift in thinking from individual to organizational focus. For example, Peter related learning in the DAT as an opportunity to grow personally as he learned that problem solving requires collaboration," *I'm learning, I'm growing. And that's what this whole group is about* ".

Professional Learning

As members they all related to increasing their clinical and political expertise, acquired an "improved' view of themselves through the assumption of the role of "educator" in the group, experienced change through taking an active work role in the group and through the role of mentor. It was interesting that these shifts in role which was reciprocal to active work roles, and that all members expressed they learned greatly as professionals. For example, in the work group meetings there was sharing as well as a challenging of processes such as educational protocols for diabetics, new techniques for testing, new ways of evaluating program outcomes, and other technologies. All described learning through the sharing of expertise, decision-making processes of trial and error, and collaboration of ideas.

Learning as a Team Member

There was a pervasive feeling that the active and reflective work experience helped the participants learn as team members. The DAT meetings were sixty to ninety minutes in length in which the problem investigation process was noted throughout the meetings. I observed that Selena, Ellen, Willa, and Helen described "learning as a member of a team" through shared knowledge, the articulation of a clear goal, trial and error of coming to a solution, and by gaining an integrated view of the problem they were trying to solve. They expressed that having the diversity of membership provided a "rich place to learn", that this learning was constant throughout the course of the DAT meetings, and that they could apply it directly to their daily work in other groups.

Minor Themes

Learning: Shaped by the Interplay of Power

The power individual members brought to the group by virtue of their expert knowledge and life experience shaped the learning experience for themselves and others; and had influence on the outcome of the group work. As I observed the DAT members' actions and interactions in the work group meetings I saw patterns of fluctuating individual power levels, which was confirmed by the document analysis and member interviews. Despite their placement of themselves in various power statuses, the group perceived the power relating to knowledge as expertise in diabetes, whether as consumer or certified clinical expertise, was highly regarded. I observed many times that the power level of an individual member was directly related to the perceived value of their contribution to the work group goal. For example, Henny and Gloria remained at a lower power level until the last DAT meeting. Sally as facilitator reported the status of their active work for them instead of asking them to report to the group. During the last DAT meeting, Henny presented the flyers herself to the DAT because Sally did not know they were completed. The other DAT members immediately embraced the work they (even though Gloria was absent), had accomplished. Henny for the first time took an active role in the problem solving, and Sally was diminished to a medium power level for the entire meeting. Henny described this meeting as a pivotal point for her, she saw an *"opportunity to teach others"* regarding outreach to the urban citizens. Her experience in DAT shifted from the learner to the educator role, her power from low to medium level.

The notion of "virtual attendance" gave power to individual members, and collectively to smaller groups that worked together on active work. When absent the members used face-to-face interaction between meetings; technology and mail systems both inter-office mail between members in the same organization, electronic and voice mail between members of any organization; facsimile; telephone; and US Postal Service; to communicate, offer reports, and leverage influence to the group problem solving. I observed the power level of Ruth, Peter, Gloria, and Ellen move as more influential when these tools were used. In fact, the members were as "virtual members", never really absent due to their "virtual presence" at the meetings.

Centrality of Ethnicity in Learning

What DAT members learned was dependent on who they were, who they represented, and the culture that belonged to them. Minority members talked about identity that who you are as a person is reflective of your ethnic community. Henny explained her view of how her life experience was helpful to the DAT "I was looking at that as helping others that are sitting around the table as far as making them aware of what the minority needs are and what their concerns are. Something that they may not even be aware of." Gloria changed her perspective to find her way to a new understanding of how to deal with the indifference she thought she encountered:

> Just let me see what is there and make them understand the importance of them to help the Latino to make a difference in that committee. Not just for me as a person but for the committee because I know there is a great need to educate, to change their way of life.

Organizational Learning

Separate from the meanings but important to note, were the implications for organizational learning that occurred as a result of the outcome of the collective team learning. Learning from the cross boundary work group became translated into changes in the various organizations' thinking and ways of acting as seen by changes in policies, procedures and systems. An example of one change is as follows: Ellen described an increased communication between professionals, and organizations in the region. Not only did it change her organization's marketing within the region, but also impacted how the education patients received in her rehabilitation organization has changed due to her increased expertise from the work group experience.

Discussion

Learning through experience in the work group was very much a product of active and reflective work done within the context of the group, among and between the members. This study supports the idea of critical reflection and transformative learning as Mezirow (1991) and Brookfield (1991) propose. The DAT members were diverse but held similar assumptions regarding the role of a group member and the role of a group facilitator and as such were

comfortable performing in those roles. What was different about them was their level of expertise regarding the clinical and non-clinical issues; their beliefs about the relationship between the project event and the mission statement of the DAT; their specific and unique frames of reference and expectations about each other's organization, and the role that organization played in the care of the diabetic population. After working together for six months, the "culture" of the DAT supported sharing of differences such as members displayed open-mindedness through their general ability to listen to disparate points of view, be open-minded about issues, and work collaboratively on active work.

This study also uncovered data that support the four learning processes identified in the study of Dechant, Marsick and Kasl (1993). For example, the majority of the DAT members "framed" their work initially by separating the targeted diabetic population into project events by fiscal quarter instead of combining them. Those two separated groups were: (a) the Caucasian financially able population and (b) the at-risk urban African-American and Latino populations. This grouping occurred through selective planning, not by open announcement of intent. The minority members noticed this and challenged this approach during the six-month work group sessions. As the work group experimented and crossed boundaries dialogue led to reframing of direction to be in sync with the mission to target the under-served as well as the African-American and Latino at-risk populations forming a new mental construct.

Within the work group, there was significant growth in the individual's willingness to link thinking and action between members, which meant between organizations. That there was an integration of perspective was outstanding, as political pressure between competitors and competition between individuals as experts in the field of diabetes and differences between ethnic groups was apparent at the start. The unifying belief and value of concern for the patient helped to build trust and promote dialogue. Unlike the literature, this study provided an in-depth view of individual learning as well as insights regarding collective team learning and organizational learning. Individual learning was different for each member, but they all learned through the mechanisms of opportunity for growth, problem investigation, collaboration, and listening to other points of view.

Another concept different from the reviewed literature on team learning was the notion of "learner" and "educator". Members transitioned between being either the "learner" or the "educator" during specific meetings and between meetings. This shift always included an opportunity for learning and happened as a result of mentoring activities between members, during the learning processes, and connected to the active work role

What was different about what this study uncovered was that individual learning was multifaceted and reciprocal to collective team learning. Several work group members experienced significant transformative learning that changed their personal lives, their role as professionals and their contributions as team members. This study supports the notion that the learning in the cross boundary work group was insituated, or occurred during the work process, it impacted their view of life, their approach to current and future work, and the expertise they held as professionals.

Brooks' (1994) research described the distribution of formal power as a critical lever in the successful production of knowledge by teams. Her research addresses the concept that formal power assigned by organizations either supports or excludes employees from carrying out the reflective or active work of team learning. In clear contrast to Brooks, this study uncovered what happened to individual member's power inside the work group, and the affect on their learning. In this context there was a unique set of circumstances that provided movement within the three levels of low, medium, and high power for individual members, and the direct influence of their status from this level to the output of the team.

A concept uncovered in this study and missing in the literature on team learning is that of "virtual attendance." This phenomenon enabled an equalization of power between those present and those absent. The relationship of this power equalizer to individual learning and team learning was significant. It provided a mechanism for individuals to maintain their status in the work group and provided a way to continue active work despite being physically absent.

The team learning literature has a silent voice regarding the ethnicity of members and the relationship to learning within the team, and how that contributes to the collective team learning. The members that represented the minority ethnic groups in the cross boundary work group interpreted work and problem solving in this setting through the lens of ethnicity, and were indeed the "voice of their communities." Minority race members were treated in ways by the facilitator that were different, such as they had less of an active voice, and they interpreted the active work as members of a different racial background assessing the work group outcomes for impact to their respective ethnic community. Minority members attached the meaning of formality to the use of reports and agendas that signified superiority, separateness between minority and non-minority work group members.

The findings of this study are limited due to the nature of the methodology utilized, that is the naturalistic paradigm, in that the primary concern of the qualitative research is to discover meanings of certain phenomenon, and these meanings are context-bound.

Contributions to Research and Practice

This research generated new knowledge related to: (a) adult learning in cross boundary work groups; and (b) use of cross boundary work groups as processes for facilitating learning integrated with and parallel to solving problems in the workplace; and (c) relationship of formal power of the members to the active and reflective work of the group. This study may help to define these work groups as learning groups. The diverse nature of cross boundary work groups is important to the field of Human Resource Development because of the potential for reciprocal multi-organizational learning to take place.

Methodologically, learning while working in a cross boundary setting works, and is worth consideration as a learning tool in the workplace while solving inter-organizational problems. It may lead to increased organizational capacity, and the ability to adapt to the ever-changing environment surrounding health care. Individual members described a deep personal learning wherein transformation of ways of problem solving in groups was evident, meaning schemes were changed, assumptions were challenged, and personal theories about work group experience were altered.

Those responsible for organizational or service line planning need to be informed that there is the capacity for generative professional learning through shared expertise between disparate and competing work organizations utilizing the cross boundary work group approach to problem solving. Cross boundary work group opportunities need to be identified by administrators responsible to assign employees to inter-organizational work groups.

Cultural diversity training is important to enable practitioners to be skilled in understanding the relationship of ethnicity, or race, and culture in the work group environment. As facilitators they need to be consistently prepared to assist work group members with the reality of their changed perspectives, provide support to them as they re-enter their work role.

Designing Dispute Management Systems

Douglas A. Benson
University of Minnesota

Conflict is a growth industry in our neighborhoods, our communities, our workplaces, our government, and amongst ourselves. We live in times of intense change and change creates conditions ripe for conflict and dispute. While we can not eliminate either change nor the conflict that results, we can choose how we handle conflicts. The challenge is to design and implement management systems which can modify the forces of change productively. Properly designed dispute management systems offer maximal organizational assistance for the mutual benefit of all stakeholders.

Keywords: Conflictt, Dispute, Resolution

Perhaps it is a paradox that one of the few constants in organizational life is change. Peter Vaille (1989) has suggested that all organizations exist in an environment which could be typified as "whitewater". An environment in which both internal and external environment in which the firm (organization) operates changes continually. In a world of increasing competition for many business organization in which the nature of the business demands evolving its operating procedures, and even its organizational culture to address the changing environment; the result in many cases has been conflict both within the organization (inter-personal, intra-group, and inter-subsystem), externally (inter-organizational with suppliers and competitors) and with customers.

Operating in environments in which businesses are opened, closed, merged, bought-out, downsized, right-sized, and re-engineered; there is ample opportunity for conflict and disputes to arise within a business organization. Therefore, a key challenge to the management of any competitive organization is the question of how to deal with conflict in the workplace and between the business and its customers (both internal and external).

Society Needs to Shift Its View of How Disputes Are Resolved

Many people - including judges and lawyers - believe that there is a litigation explosion involving too many frivolous law suits or other legal actions which seem more appropriate to being handled outside of the courtroom. Litigation is widely seen as a poor way to determine the truth, that it harms relationships, it is too costly, and it takes too long (Umbreit, 1995).

Expand Dispute Resolution Options

Many courts are now actively referring cases to mediation either at the time of filing or doing the settlement phase. Dispute management professionals then have an opportunity to intervene to settlement the matters in conflict before the parties initiate a cycle of emotional states not unlike that grief counselors experience with their clients. This "resolution cycle" is also known (depending upon the discipline) as the trauma or grief cycle in which the participant(s) move through a series of emotional states: shock/denial; bargaining, guilt, fear, depression, anger, acceptance/resolution.

This resolution cycle works in groups, organizations and nations as well as individuals. However, the resolution cycle is present in every significant conflict or dispute, including those which appear intractable i.e. international border disputes) and those" settled" by the legal system. When groups, organizations, cultures, societies or nations are presented by threats arising from conflict that send them or present the possibility of sending them into exile into armed conflict; they attempt bargaining and experience guilt, fear, and anger. Finally when or lose, they go through acceptance and or resolution.

However, this resolution cycle does not just apply to severe emotional loss or conflict. The stress of changing jobs, or facing organizational downsizing or even obtaining a mutually agreeable divorce or an automobile accident can trigger the cycle. The resolution cycle is part of the normal human and organizational coping mechanism, and is a significant factor in the design of many alternative dispute management systems.

Copyright © 1999 Douglas A. Benson

Many organizations and organizational members when faced with environmental stress within the organization invariably go through the first parts of the resolution cycle (shock and denial); bargaining (with each other or other forces); guilt (collective or individual); anger and depression. They may go experience these steps in almost any order and may go through the steps more than once as events are played out. However, without the help of HRD professionals and appropriate intervention strategies, including an appropriate dispute management system, they may not be able to satisfactorily reach the last stage of acceptance/resolution - whether or they "win" or "lose" the conflict. Without resolution they have not come to an end of the dispute regardless of what has been the formal or informal settlement or how the other party (or parties) feel regarding closure or resolution. A cross-disciplinary approach that recognizes that this cycle is present can facilitate settlement. By being aware of the resolution cycle, those designing and administering a dispute resolution system can guide the parties through not only the formal structural issues but also the emotional issues as well.

Many courts now refer cases regarding divorce child custody, visitation rights, spousal support), community disputes, teacher-student conflicts, sexual discrimination/harassment in the workplace, and victim-offender (restorative justice) to alternative dispute resolution arenas. The courts have come to realize and value the need to allow the parties to not only reach a mutually agreement settlement but to progress the emotional resolution cycle as well. Further, some disputes have benefited from the early intervention of a neutral evaluator to assist the parties to focus on key issues early on in order to save time, money, emotional distress, and to contain the scope of the dispute.

Another way to reduce litigation is to resolve the disputes promptly in the institution or organization in which they arise. Dispute management professionals and systems can apply principles of dispute system design in schools, businesses, government agencies, and virtually every other type of organization. These dispute procedures can be designed to focus directly on satisfying the parties basic interests as well as they emotional needs without creating battles or will or major legal fights. Further, even as the disputes (or potential disputes() make their way through institutions and organizations, people can learn how to listen, how to express themselves respectfully, and how to solve problems cooperatively. Here then is an opportunity for HRD [professional to assist in the design, operation, management, and education of conflict management systems for the mutual benefit of all stakeholders: individuals, organizations, institutions, and society. nations

The Nature of Conflict and Dispute

While it is customary to refer to conflict management and dispute resolution as if they were the same thing, they are, in fact, different. Conflict is the result of a process that gives rise to a dispute. The dispute is the result of conflict. Ury (1988), Fisher (1991) and Umbrecht (1995) all suggest that conflict results from the perceived need for change in the status quo by one party and resistance to change or the need for the change by another (individually, as a group, as an organization, or even as a nation). They suggest that conflict has three pre-conditions that are necessary in order to conflict and therefore, for a dispute to arise: (1) an interdependent relationship must exist between the parties, (2) a perception by one or both parties that their goals (expected outcomes of their interactions) are dissimilar, and (3) a perception that one or both parties are preventing the other from achieving their desired outcomes and/or goal(s).

Fisher and Ury (1991) have classified disputes and conflicts into three broad headings; (1) rights-based, (2) interest-based, and (3) power-based. To this list, Umbreit adds disputes based on the psychological needs of the disputants (for example esteem and fairness issues).

POWER	RIGHTS	INTERESTS
Political	Legal	Substantive
Economic	Collective	Procedure
Moral	Individual	Psychological
Social	Ethical	Societal

Ury and Fisher (1991) suggest that conflict is neither good nor bad. It should be perceived, therefore, by an organization (and organizational members) as a fact of organizational life brought about by the nature of the changing and evolving environment (both internal and external) in which the organization operates. The result should be for the organization to deal in a positive manner with the forces for change which give rise to conflict within the organization and between the organization and its external environment.

Even if the organization fails to adopt a conflict management system, it still is faced with conflict. They can try to deny it, quash it, bury it, ignore it, or deal with it in a positive ad productive manner. Organizations which choose to ignore or deny the existence of conflict and pretend they are "one big happy family", perhaps, a dysfunctional family, but still a family (Cummings and Worley, 1993) overlook the results that unresolved conflict can have within the workplace and with customers and suppliers. In *Winning Through Accommodation* (1983) Evarts noted that unmet needs for conflict/dispute resolution can be manifested in several ways:

- Interpersonal disputes between employees, between employees and supervisors, between teams within the workplace, between divisions or subsystems within the firm, between the firm and its customers, and between the firm and its suppliers.
- These disputes, whether acknowledged or not, lead to litigation.
- They can lead to worker slowdowns, either intentionally or unintentionally.
- They can lead to sabotage either through destruction of vital work components or through more subtle methods such as withholding vital information, rumor generating, adverse publicity, complaints to regulators, efforts to subvert the operations of another division or team.
- Low morale amongst employees and line workers through top management. This in turn can lead to rapid turn-over and/or loss of productivity.

In short then, conflict is a natural occurrence of the changing environment in which organizations operate. By itself, change and the conflicts which may result which lead to disputes are of themselves, neither good nor bad. They just are a natural occurrence of the operations of the organization. The critical question is what the organization does to deal with conflicts and disputes.

Organizational Development Theory

Organizational development theory (OD) has been developed , in part. as a response to the needs for organizations to address the need for change within the organization (attitudes, structures, procedures, and culture,) in a planned manner consistent with the principles of the behavior sciences (Cummings and Worley, 1993). Beckhard (1977) and Harris (1977) define OD as the planned study of organizational structures and procedures in order to promote the growth and development of the organization in a manner which further the competitiveness, efficiency, and health of the organization. McLagan (1983) further suggests that OD has a principal purpose the need to systematically address issues regarding inter-personal and inter-group conflicts.

Clearly then, OD theory (and Human Resource Development theory, in general) offer tools which can be utilized to address issues of conflict with an organization. Especially noteworthy are the contributions of Lewin regarding organizational change theory, Beckhardt regarding open systems theory, Argyris regarding the role of the intervener in designing and managing organizational change, Emery and Trist (1973) regarding socio-technical systems approach to OD, and Senge (amongst others) regarding the creation of a learning organization.

Taken together, OD theory has evolved from simply a theoretical approach to organizational change and change management (including conflict management) to one in which theory is applied to practice (and vis versa). This idea of applying theory to practice and practice in the formation of additional theory, is referred to my some as Action Learning and is fundamental to Senge's proposal for a creating learning organizations. Further, action research has given rise to a model for OD planning and intervention which is useful for the design of conflict management and dispute management systems.

The model has seven critical elements:

1. Entry and Discovery
2. Research and Data Gathering
3. Action Planning
4. Implementation

5. Evaluation
6. Dissimilation
7. Exit

During the entry and discovery phase the consultant would meet with top management and determine their perceptions of the problems and issues facing the organizations. What do they regard as the problems and the causes of the problems? Agreement also must be reached as to an action plan for investigation of the organization (research and data gathering, plan development, plan implementation and evaluation and dissimilation) and a commitment to implementing the action plan once it was developed.

The second phase is the research and information gathering phase. It is common for the views and experiences of top management to be both accurate and inaccurate regarding the extent and nature of conflict issues within the workplace. That is, they may be focused on the results of conflict and disputes a as the problem rather than the result of deeper more structural, cultural, procedural, or environmental problems. Further, they may or may not realize that top management and management policies are the cause or the result of the conflict (they may be in denial or unaware). Therefore it is necessary and appropriate to engage in research and data gathering activity to determine, objectively, the nature of the conflicts, their causes, their extent, and their affects on the operations of the organization.

The third phase, the action planning phase, requires the gathering of relevant information from throughout the organizations regarding proposed solutions to the conflicts. Since it is the stated goal of the organization to not just address the conflicts and disputes but to also design an on-going system to handle conflicts in the future; the focus of the action planning phase is aimed at this wider objective and will involve input from throughout the organization.

This action planning phase serves to highlight the advantages of an OD approach to the design of conflict management systems since OD practitioners place a high value on humanist approaches to problem solving, organization-wide involvement, participation and support from top management, voluntary participation in the data gathering/discovery and action planning phase, and confidentiality for all participants. It is an inclusive rather than exclusive process involving all segments and operation of the organization and not just top management. It involves a review of the structure, attitudes, operations, policies, culture, and environment (internal and external) of the organizations. It will involve customers of the firm, again, both internal and external.

This action planning phase also highlights the fundamental principle of OD in which an organization typically falls within a spectrum ranging from open to closed. Beckhard (1977) noted that many organizations (open) are very aware of the environment in which they operate and seek input from the environment in determining operational policies and in designing and redesigning (adjusting) such policies as the environment changes, is changed, or evolves. Open system organizations are also well aware of the interrelationships between subsystems within the organization (accounting, marketing, human resources, customer relations, production, legal, etc.). They are also aware that many individuals, teams, groups or subsystems over-lap or are trans-organizational and interactive. Gaining input and support from across and throughout the organization then is recognized as crucial for the smooth and appropriate operation of the organization. They recognize that conflict as a process, and disputes as a result of process, can be minimized by remaining open to multiple sources of information within the organization.

Closed Systems, on the other hand, do not seek input from the environment and make decisions internally (typically top management) without concern for the environment (internal and external) in which the organization operates. These organizations also may demonstrate a "warrior" mentality in which the organizational, group, individuals, and subsystem conflicts are largely ignored or are confronted and settled through resorting to power, authority, rules, regulations, law (including litigation) and prevailing, historic organizational practices. They also may choose to ignore or deny conflict either through eliminating the conflict (firing an employee, for example) or simply issuing a management mandate.

An alternative approach to the "fight" response organization, is the "flight" response organization. Here, they too ignore the systemic aspects of conflict (and the need for a viable conflict management system within the organization) by compartmentalizing conflict. Conflicts and disputes are classified by managers and then shipped off for resolution to accounting, customer relations, production (or quality control), the legal department, human resources/personnel, or the union/collective bargaining agreement.

Key Features of a Conflict Management System

As indicated above, by using an OD and Open Systems approach through action research, a more comprehensive and long-term approach to conflict management can be developed. Fisher (1991), Ury (1988, 1991), Umbrecht (1995), Carver (1994), Costantino (1996), Cummings (1977) and others have identified several key elements in designing conflict management systems and in their operation. The first element is a recognition of the need for a hierarchy of alternatives to address conflict and disputes within the organization. These alternatives are arranged from low-cost/low-risk to high-cost/high risk. This hierarchy mirrors a continuum from highly informal to highly structured. The second element, is a system which would allow disputants to move up the hierarchy as the need arises to address some or all of the issues in disputes (rights, power, interests, and psychological needs). Also, they have the right or opportunity to move down the hierarchy ("loop-back").

It is also critical to have a system which acknowledges that prevention of conflict and dispute is preferable to having to manage conflict. This would involve the development of alternative dispute resolution training at the individual worker level (interpersonal disputes), group level (inter-group disputes) and between management and employees. Included in this is training to all parties in communications skills, stress reduction, and marketing of the conflict management system within the organization.

Should a dispute arise, the first option would be to a negotiation level between the parties allowing them to achieve work-out agreement amongst themselves. Failing this, the second step would be for a facilitated method of dispute resolution with an outside expert (that is outside to the dispute), but the resolution still rests with the disputants. Third step might be to a fact-finding level at which the third party (a neutral to the dispute again) would engage in a discovery of relevant facts and issues. The settlement of the dispute would still rest with the disputants, but the fact-finder might offer an option regarding the likely outcome if the dispute moved to the next higher level. That higher level would be mediation. Here again a third party would work with the disputants to reach a satisfactory solution, again acceptance of the resolution rests with the disputants. Finally, the dispute would become the subject of arbitration in which the third party made a formal ruling or determination regarding a proposed solution. This finding may or may not be binding on the parties, but it would offer them an opportunity (as in mediation) to consider input from an objective, outsider to the dispute. Frequently in the case of both mediation and arbitration this third party can render expert judgement on the dispute and the likelihood of resolve at the last level, litigation.

As part of the design and education process, the consultant would promote the design of a system (including education, marketing negotiation, mediation, fact-finding, and arbitration) which emphasized several key elements in conflict/dispute resolution efforts. These elements as reflected in the philosophy, experience, research and practice of, amongst others, Ury, Fisher, Umbrecht, Consentino, all emphasis certain common characteristics:

1. Focus on the issues in dispute not personalities, not authority, not positions or power;
2. Keep the focus on the interests of the parties not the people;
3. Use objective criteria in assessing and describing the conflict and proposed solutions;
4. Remain solution focused but also allow for the venting of emotions;
5. Allow for the disputants to either retreat to alternative (low-risk lost cost alternative) or to simply terminate the discussion recognizing that the may see a better alternative to a negotiate settlements as being in their best interest;
6. Design a system in which the disputants have access to advise (consultation) before and during the process of resolution and to feedback after regarding both their assessment of satisfaction with the settlement and its implementation.

Based upon input from throughout the organization regarding the need for a conflict management system (which has an education, training and marketing component) and recognizing and reflecting the key elements for the design and operation of conflict management systems above; an action plan can be developed and preliminarily implemented. Based upon feedback from throughout the organization regarding their satisfaction and their experience with the system, an evaluation can be made of where changes are necessary and appropriate or where additional training in dispute resolution or marketing of the system is necessary.

Once the system has been found acceptable to members and groups (stakeholder) throughout the organization and perhaps others (suppliers, external customers, regulators, etc), then the conflict management system can be implemented (disseminated) throughout the organization and institutionalized.

At this point, the consultant may exit the organization and the organization can operate the system, bearing

in mind that they may have to modify the system over time as the needs of the organization change. Further, a continuing needs exists for training in dispute and conflict management strategies, communication skills, group interaction skills, and for marketing the conflict management system in order to prevent minor disputes escalating into major disputes (interpersonal, inter-group, intra-organizational, or systemic).

The Conflict Management Spectrum

Unassisted Problem Solving	**Assistance by Neutrals**	**Advisory Assistance**	**Third-Party Decisions**	**Litigation**
Avoidance	Facilitated Negotiations	Early Neutral Evaluation	Binding Arbitration	Lower Courts
Day-To Day Discussion and Interaction	Consensus Building Through Informal Mediation	Fact Finding	Administrative Boards and Commissions	State Courts and Appellate Courts
Normal Business Meetings and Encounters	Formal Mediation	Nonbinding Arbitration	Court Ordered Special Studies or Masters	Administrative Law Judge
Informal and Formal Business Information Exchanges	Court Appointed or Ordered Alternative Dispute Programs	Dispute Resolution Boards	Binding Court Ordered Settlement	Federal Courts
Problem Solving Sessions	Settlement Conferences	Summary Court Judgement (By Judge or Jury)	Mediation and then Arbitration	Supreme Court
Partnering (may involve facilitator)	Team Building			

Conclusion

Organizational conflict must not necessarily be reduced, eliminated, or avoided, but managed to reduce its dysfunctional outcomes and enhance its functional outcomes for all stakeholders involved. The management of interpersonal or organizational conflict involves the proper diagnosis and the intervention strategy into the conflict. A comprehensive diagnosis involves the assessment of the nature of the conflict, the source of the conflict, the depth and stage within the emotional resolution cycle, and the extent to which the conflict involves individuals, groups, the organization or inter-organizational conflict. The analysis of intervention strategy involves an appropriate assessment of how to intervene and when to intervention. This intervention strategy must include the establishment of a dialogue between the intervener and all of the parties to the dispute.

However, just as water is ever present in our physical environment, conflict and the potential for conflict arising from change forces upon organizations can lead to disputes. Further, just as water in the right proportion can be a stimulant for growth, conflict can also be a positive growth force for organizations. However, to much water or too much uncontrolled conflict can prove destructive. Systems exist to deal with high levels of water, systems can also exist to deal with change, conflict and disputes,. It is imperative that organizations design and operate appropriate conflict management/dispute resolution systems if they are to channel the forces for change in response to environmental and systemic needs in order to stimulate the growth of the organization. Left unchecked water is a destructive force of nature, unfortunately, left unmanaged, conflict in the workplace can also be destructive, and like natural disasters, lives have been lost due to unchecked conflict. OD and HRD can offer organizations tools and techniques appropriate to dealing with change and change management.

BEST COPY AVAILABLE

The skills and knowledge of OD practitioners can be utilized to develop appropriate conflict management systems. Through the use of an appropriate action research planning model and an open systems approach to business operations utilizing the fundamental principles for the design and operation of conflict management systems, a suitable system can be developed for a workplace situation. It is not necessary quick, easy, or even painless for some businesses to do so as flaws in the organizations structure, policies, cultural, artifacts and history may be revealed. But the resulting system for managing conflict will serve the organization well in the long term.

Application and Test of a Model of Team Effectiveness to Self-Managing Interdisciplinary Psychiatric Treatment Teams

Reid A. Bates
Louisiana State University

This study tested a causal model of self-managing team performance in the context of interdisciplinary psychiatric treatment teams. The findings showed 1) team design factors, indicated by level of task clarity, shared team mission, and leadership support, positively influenced work process; 2) interpersonal process factors did not influence work process; 3) work process was a significant predictor of team performance. The general pattern of relationships supported the hypothesized model.

Keywords: Teams, Team Models, Teamwork Process

Interest in and use of self-managing teams in organizations has increased dramatically. In 1987, 28% of the Fortune 1000 companies reported using self-managing work teams (SMTs) with some employees. By 1990, that number had grown to 47% (Cohen, Ledford, & Sprietzer, 1996). Organizations are increasingly turning to SMTs because they often offer a competitive advantage. Evidence indicates SMTs can enhance productivity (Guzzo, Jette, & Katzell, 1989), contribute to cost savings (Wall, Kemp, Jackson, & Clegg, 1986), and increase employee satisfaction (Cohen & Ledford, 1994). Case studies have shown employees working on SMTs produce more than those organized in more traditional, hierarchical structures (Hackman, 1990). Such teams are effective decision-makers because those who are closest to the work make the decisions (Ray & Bronstein, 1995) and are capable of high levels of innovation and creativity. Because SMTs handle a large degree of their own management responsibilities, fewer first-line supervisors are needed, and they are able to complete as much or more work at a lower cost (Yeatts & Hyten, 1998).

SMTs are groups of interdependent employees that operate in an organizational context who are responsible for managing and performing tasks that deliver a product or service (Yeatts & Hyten, 1998). Key characteristics include (1) task interdependency; (2) responsibility for product or service delivery; and (3) decision-making authority over task objectives, work assignments, work methods, and task scheduling and monitoring (Goodman, Devadas, & Hughson, 1988). SMTs are best distinguished from work groups and task or project teams by their high levels of interdependence and accountability in addition to their typically long-term purpose (Yeatts & Hyten, 1998).

SMTs have a long tradition in health care organizations. In this context, SMTs (1) provide a structure that helps guarantee a coordinated, 'whole client' treatment approach; (2) enhance interdisciplinary communication in the face of increasing professional specialization; (3) are often required as a response to legislative mandates aimed at improving the quality of patient care (Ducanis & Golan, 1979); and (4) help insure more continuity in service provision in high burnout, high turnover fields such as community mental health (Bond, Pensec, Dietzen, McCafferty, Giemza, & Sipple, 1991).

Models of Team Effectiveness

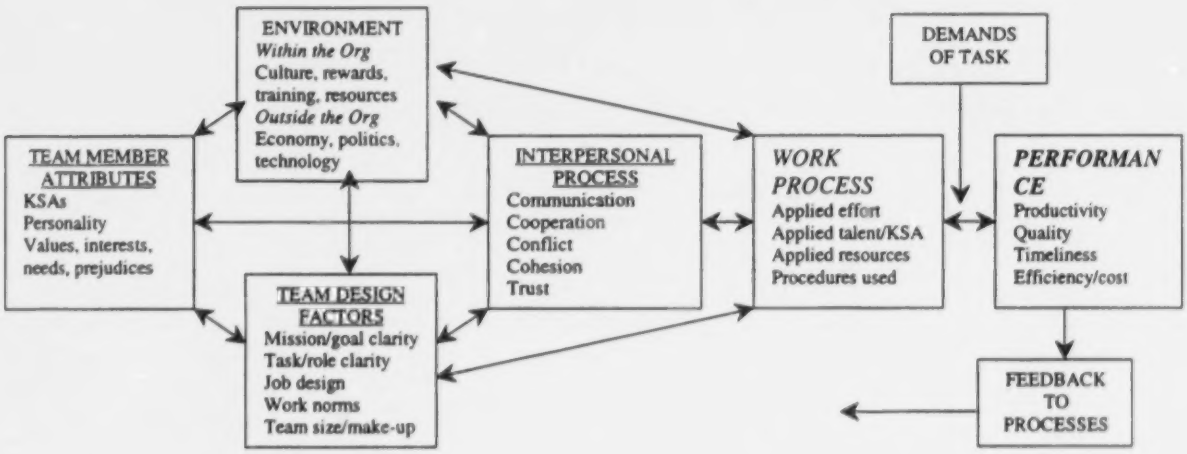
Models of team and work group effectiveness have proliferated in recent years. Most of these models have been designed for application to work groups in general, not to SMTs specifically. For example, Tannenbaum, Salas and colleagues have produced two models of team performance both addressing teams and work groups in general (Salas, Dickinson, Converse, & Tannenbaum, 1992; Tannenbaum, Beard, & Salas, 1992). Campion, Medsker, and Higgs (1993) developed taxonomy of characteristics or 'themes' that are related to the effectiveness of work groups in general. Hackman's (1990) model of work teams in organizations broadly defines its' domain as 'real' groups operating in organizational contexts with one or more tasks to perform. Although this model has been applied to SMTs (Vinokur-Kaplan, 1995), it is clear that SMTs are not its exclusive focus. In general, these and other models have not clearly specified the types of teams to which they are most applicable. Although research with these models has been able to explain significant variance, much remains unexplained. This may partially clarify why work group research has been able to provide an extensive list of variables that may be related to effective performance but has yet to reach agreement about what is truly important (Hyatt & Ruddy, 1997). There also appears to be a growing consensus that team tasks play an integral role in determining what is needed for effective performance (Bettenhausen, 1991; Hackman, 1990). The nature of team tasks is important because it determines how effectiveness is defined, determines the criteria of effectiveness, and influences which characteristics of team are most important in explaining their effectiveness. Given that different kinds of teams with different goals, tasks, and

Copyright © 1999 Reid A. Bates

dynamics may behave differently, it is reasonable to expect that models of team effectiveness focusing more specifically on SMTs will have better explanatory power than those which address teams and work groups in general.

Yeatts and Hyten (1998) synthesized the research and conceptual work done with other models of team effectiveness to produce a model applicable to SMTs. Although the model was initially tested using a multicase, multimethod replication design (Yin, 1989), further research is needed to confirm the causal paths suggested and to establish the generalizability of the model to different settings. The model is shown in Figure 1.

Figure 1
Factors Affecting Self-Managed Work Team Performance (Yeatts & Hyten, 1998)



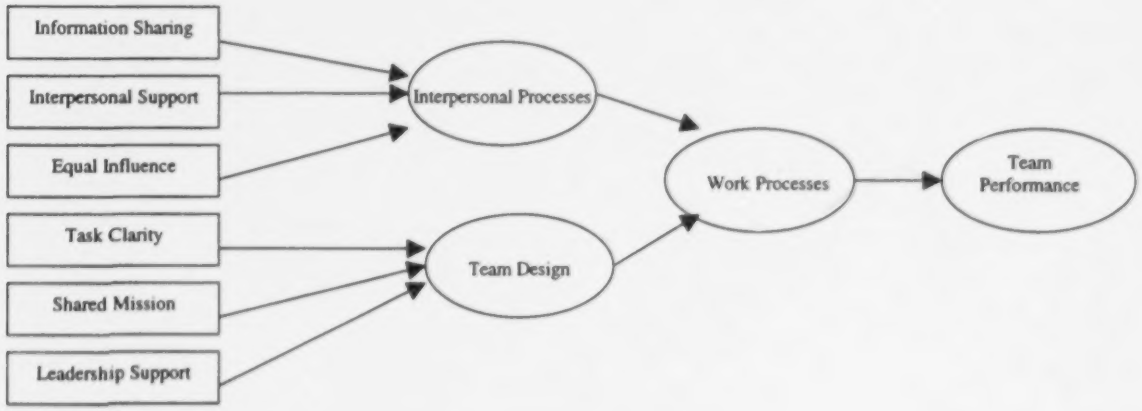
Like other models of SMT performance, the Yeatts-Hyten model is an input-process-output model that suggests a number of components or categories of variables can influence SMT effectiveness. Many of the components found in the Yeatts-Hyten model, such as environmental factors, team member characteristics, team design factors, and interpersonal processes, are also found in other models of SMT performance. Perhaps the major advance offered by the Yeatts-Hyten model over other models is the inclusion of work process factors as intervening variables between environment elements, team member characteristics, team design factors, and interpersonal processes and team performance. Work process factors refer to " the factors that are applied directly on doing the [team's] work, the procedures used for doing the work, the talent applied to the work (knowledge, skill, and ability), and the resources used to accomplish the work" (Yeatts & Hyten, 1998, p. 57). This set of factors represents the critical enablers of team performance in the sense that it here that a team's work is done. Most previous theoretical models of team performance have not included such intervening variables. Rather, they have tended to portray variables like interpersonal processes as having direct effects on performance outcomes. This conceptualization suggests that a team's ability to resolve conflict would directly influence key outcomes. Research by Yeatts and Hyten (1998) suggests such factors may enhance or diminish work process factors but do not directly influence outcomes. For example, given the desire for high quality treatment plans, a key performance outcome of psychiatric treatment teams, a team's poorly developed conflict resolution skills is seen as disrupting the work processes needed to formulate high quality, effective plans.

The purpose of this study is to test a portion of the Yeatts-Hyten (1998) model using structural equation modeling, with a specific interest in the role of work process factors as intervening variables. Specifically, this study examines the relationships between interpersonal processes, team design, work processes, and performance. Interdisciplinary psychiatric treatment teams are the focus of this study. These teams have a multidisciplinary membership that typically includes psychiatrists, psychologists, social workers, recreational or occupational therapists, nurses, and psychiatric aides. The teams are responsible for developing and implementing individualized treatment plans for patients with mental and emotional disorders. They exercise full authority over all aspects of patient care. Consequently, the team members have a need to communicate about patient status, diagnosis, and

progress with regard to short and long-term goals, treatment, and length of stay/discharge status. In short, psychiatric treatment teams are highly task and outcome dependent to the extent they must work together closely to perform effectively.

The model and variables tested are shown in Figure 2. The model shows that information sharing, cohesiveness, and equality of influence are indicators of interpersonal processes. Task clarity, shared mission, and leadership support were conceptualized as indicators of team design. Both interpersonal processes and team design are seen as influencing work process, which, in turn, affects team performance.

Figure 2
Hypothesized Model of Team Effectiveness



Concepts and Hypotheses to be Tested

A number of team design characteristics have important implications for SMT performance. Several authors (Hackman, 1987) have recognized that team effectiveness can be influenced by the degree to which team members understand their roles and tasks and the coordination of these for one common overall purpose or mission. Task and mission clarity can improve SMT effectiveness by improving the team's work structure, reducing role ambiguity, or improving coordination and communication (Tannenbaum, Beard, & Salas, 1992). The support team members receive from team leaders is also considered an important factor in team performance (Campion et al., 1993; Hackman, 1987). Team leader support can influence the stability of the team, the design of the work, the goals of the team, the availability of resources to the team, all of which can influence work process (Yeatts & Hyten, 1998).

Hypothesis 1: Team design characteristics will be positively associated with work process.

The ability of teams to optimize interpersonal processes has been identified by a number of authors as highly critical for SMT performance (Cohen et al., 1996;Tannenbaum et al., 1992). Work in SMTs requires that team members be capable of effectively sharing information, providing interpersonal support, and contributing to productive team decision-making and problem solving (Stevens & Campion, 1994). These core capabilities are believed to permeate all aspects of team functioning. For example, they influence team stability, the ability of the team leader to support team functioning, and the ability of the team to manage its own leadership. Yeatts and Hyten (1998) suggest its most profound influence on team performance may occur through the team's work process: the efforts, talents, and resources, and procedures applied to the team's work.

Hypothesis 2: Interpersonal processes will be positively associated with work process factors.

Yeatts and Hyten (1998) theorize that environmental, team design, and interpersonal factors moderate work process factors. They further suggest that work process factors (effort, talent, resources, and procedures) are important to team functioning regardless of task, although the demands of the task may moderate the amount of a work process factor needed to for effective performance. In the context of psychiatric treatment teams, the present

research tests the influence of work process on the ability of psychiatric treatment teams to develop high quality, effective treatment plans.

Hypothesis 3: Work process factors will be positively associated with team performance.

Method

Subjects

One hundred forty two mental health professionals representing 25 interdisciplinary treatment teams operating in three branches of a state mental health hospital were sampled for this study. Two teams (14 respondents) worked in a short-term care facility preparing short-term treatment plans for new admissions, stabilizing them, discharging them quickly or transferring them to a long-term care unit. Seven teams (44 respondents) were from a long-term care unit where they prepared, implemented and revised treatment plans for patients requiring long periods of care. Twelve teams (84 respondents) were from a forensic unit that prepared, implemented and revised treatment plans for patients with criminal histories who required long-term care. In all, the respondents were divided among nurses (13.8%), correctional guard/therapists (10%), psychiatric aides (19.2%), psychologists (10.7%), recreational or occupational therapists (18.4%), social workers (21.5%), and psychiatrists (6.1%).

Procedure

Data was gathered from members of interdisciplinary psychiatric treatment teams using a questionnaire instrument developed by the researcher. A number of discipline-specific focus groups were held with members of the teams under study. The majority of questionnaires were administered and collected during focus groups held with team members. A smaller number were delivered to specific units where a senior hospital administrator distributed them during regularly scheduled team meetings. In this case, completed questionnaires were placed by respondents in sealed envelopes and returned to the researcher by mail. These data were collected as part of a larger needs assessment project done for the Department of Health and Hospitals and other state governmental agencies in late 1997.

Measures

A questionnaire instrument was developed to operationalize a number of variables from a model of SMT performance proposed by Yeatts and Hyten (1998). Variables were selected based on their fit with the model, a review of team-related research, and their relevance for this context.

Eight measures were constructed for the present study: information sharing, interpersonal support, equality of influence, task clarity, shared mission, leadership support, work process, and team performance. All constructs were assessed using multi-item measures. The response choice for all items was a five-point Likert-type scale ranging from 1 (strongly disagree) to 5 (strongly disagree). Scale scores were calculated by averaging the ratings for all items in a construct. For all measures, higher scale scores indicated greater presence of the construct being assessed. Each measure is described below.

Information sharing.

Information sharing was measured by three items that assessed team member perceptions of the degree to which individuals are able to discuss and share information (e.g., "Team members do not discuss some important problems because the other professional disciplines would not fully understand them").

Interpersonal support.

Interpersonal support was measured by four Likert-type items that assessed the degree to which individuals believed team members supported one another, influenced each other in positive ways, and desired to continue to work together as a team (e.g., "We influence each other in a positive way").

Equality of influence.

A three-item measure assessed the degree to which team members believed they have equal ability to influence team decisions and actions (e.g., "Each member of the team has as much influence on team decisions as any other member").

Task clarity.

Task clarity was assessed using a three-item scale that measured the extent to which team has established clear task and procedural expectations of individual team members (e.g., "Our task assignments are clear").

Shared Mission

Three items measured the degree to which team members have established and share a common mission in terms of the services they provide (e.g., "We share a common mission or purpose").

LeadershipSupport

Leadership support was measured by three items that assessed the extent to which team members communicated with and received support and feedback from the team leader (e.g., "We receive honest feedback from our team leader").

Work Process

Work process refers to factors that are applied directly to accomplishing the team's work, and can include four dimensions: effort, talent, ability or KSAs applied to the work, the resources used to accomplish the work, and procedures used for doing the work (Yeatts & Hyten, 1998). One of the most important factors affecting team performance is level of existing ability: when teams don't have the appropriate talent or ability or are not able to apply the skills they have, their performance will suffer. The present study focuses on the talent/ability element, conceptualizes work process as a treatment team's ability to successfully manage team processes in the development and implementation of treatment plans, and measures the construct with four Likert-type items (e.g., "One of our strengths is the ability to plan and coordinate activities to meet treatment objectives").

Team Performance

One of the most important indictors of psychiatric treatment team effectiveness is their ability to produce high quality treatment plans that effectively identify and address patient needs. Team performance in this study was measured with six items that addressed treatment plan quality (e.g., "Our team's treatment plan identify and prioritize patient needs", "The interventions in our treatment plans are individualized for specific patients").

Analysis

Structural equation modeling (SEM) with LISREL 8 (Joreskog & Sorbom, 1993) was used to test the causal relationships between variables. The application of SEM provides a way to 1) model and estimate multiple and interrelated causal relationships, and 2) represent unobserved variables or concepts in these relationships and account for measurement error in the estimation process (Hair, Anderson, Tatham, & Black, 1998). One advantage of LISREL is that it provides tests of relationships between constructs that are not attenuated by measurement error (Loehlin, 1987).

Results

Following a procedure suggested by Hair et al. (1998), data analysis was conducted in two stages. First, the adequacy of the measurement model was examined to evaluate the contribution of each item to the construct being measured. Second, the structural model was examined to test the fit of the hypothesized model with the data. For both the measurement and structural models, a wide variety of goodness-of-fit indices are available for assessing model fit. To assess overall model fit, the chi-square statistic (χ^2) and the goodness-of-fit index (GFI) were examined. The root mean square error of approximation (RMSEA), a measure relatively insensitive to sample size, and the root mean square residual (RMR) were examined as complementary measures to the GFI and χ^2. The adjusted goodness-of-fit (AGFI) was evaluated because it adjusts the GFI by the degrees of freedom in order to consider the parsimony of the model. To compare the model's fit in relation to the worst and best fit attainable from other nested models, the normed-fit index (NFI) was examined. In general, a good fit of the data is indicated by RMSEA and RMR values that approach zero (with those larger than .08 as unsuitable), and GFI, AGFI, and NFI values that approach 1. Finally, the coefficient of determination (R^2) was examined in relation to the structural model as an indicator of variation accounted for, not of model fit per se.

Measurement model

As is generally recommended, analyses were based on a covariance matrix. Initial analyses calculated the means, standard deviations, and reliabilities for each scale (see Table 1). All scales had adequate variance and reliabilities ($\propto$ = .69 to .91) and all items loaded on their a priori determined factor. For each variable the t values associated with each of the loadings exceeded the critical value for the .05 significance level (critical value = 1.96) and the .01 significance level as well (critical value = 2.58). This verifies the posited relationships between indicators and their constructs. The measurement model produced a chi-square value of 427.23 (df = 322, $p < .001$). Other fits indices included GFI = .81, AGFI = .76, NFI = .82, RMSEA = .050, and RMR = .082. These values indicated the fit between the proposed measurement model and the observed data was marginally adequate. Examination of the modification indices did suggest possible options for model respecification. However, the suggested modifications could not be theoretically justified. Therefore the measurement model was accepted. The intercorrelations of the measures presented in Table 2 indicate none exceeded .80, a level commonly regarded as indicative of problems (Hair et al., 1998).

Table 1: Means, Standard Deviations, and Reliabilities of Measures[a]

Measure	Mean	SD	Reliability
Information Sharing	2.89	.92	.74
Interpersonal Support	3.27	.91	.91
Equality of Influence	2.70	.57	.69
Task Clarity	3.27	.91	.86
Shared Mission	3.48	.80	.83
Leadership Support	3.52	.99	.86
Work Process	3.22	.87	.88
Team Performance	3.41	.73	.82

[a]Means represent the average response to items in the scale and standard deviations are the average standard deviation of items in the scale.

Table 2: Correlations Among Measures

Measure	INF	INT	EQL	TC	SM	LS	WP	TP
Information Sharing	1.00							
Interpersonal Support	.51	1.00						
Equality of Influence	.27	.17	1.00					
Task Clarity	.54	.73	.23	1.00				
Shared Mission	.57	.71	.14	.70	1.00			
Leadership Support	.50	.62	.22	.56	.62	1.00		
Work Process	.63	.71	.23	.71	.74	.61	1.00	
Team Performance	.49	.49	.25	.55	.53	.51	.65	1.00

Structural Model

A total of 18 paths were tested (see Figure 3) in the structural model. In addition to the nine paths shown in the conceptual model (Figure 2), nine additional paths were added. These paths were added in order to obtain an adequate number of indicators for the two of the latent variables. Thus, paths for the scale items for work process (items 56, 58, 59, 61) and team performance (items 77, 79, 85, 86, 87) were included in the structural model.

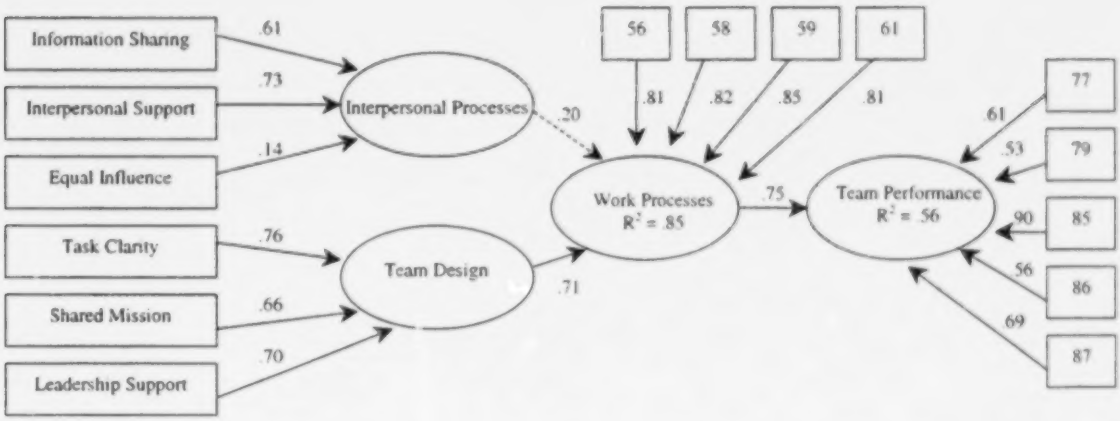
The results of the structural analysis are summarized in Figure 3 which displays the standardized path coefficients (beta weights), as well as the explained variance (R^2) for the dependent variables work process and team performance. A dashed line indicates unsupported paths. As can be seen, 17 of the 18 hypothesized paths were supported ($p < .05$). The structural model produced a chi-square value of 108.78 (df = 86, $p < .05$). The GFI (.90), AGFI (.86), NFI (.91), RMSEA (.045), and RMR (.042) were all indicative of acceptable fit.

As predicted, team performance was relatively well accounted for by the model (R^2 = .56) and work process emerged as a significant predictor (B = .75). The indication is that treatment plans quality is significantly enhanced when teams are able to successfully manage processes critical to the development and implementation of treatment plans. This includes the ability to manage intra-team disagreements in ways the make the team more effective, resolve conflicts in positive ways, and coordinate team activities to meet treatment objectives.

The results further suggest that work process is enhanced by team design factors (B = .71) as predicted by the Yeatts-Hyten model. Team design was an unmeasured latent variable in this study that was strongly influenced by

task clarity (B = .76), shared mission (B = .70), and to a lesser extent leadership support (B = .50). Contrary to expectations, interpersonal processes, another unmeasured latent variable in this study, was not a significant predictor of work process. Interpersonal processes were, however, significantly influenced by information sharing (B = .61), interpersonal support (B = .73), and, to a much lesser degree, equality of influence (B = .14).

Figure 3: Structural Model with Path Coefficients



Conclusions

This research tested the applicability of a portion of the Yeatts-Hyten (1998) model of SMT performance to psychiatric treatment teams. The overall pattern of relationships between independent and dependent variables was generally consistent with the Yeatts-Hyten model. Seventeen of 18 tested paths between predictors and dependent variables were significant indicating most of the predicted relationships held.

According to Yeatts and Hyten (1998), work process factors are those factors applied directly to the team's work or "where the rubber hits the road" in terms of actually doing the work of an SMT. These authors depart from previous models of SMT effectiveness to suggest that work process, not interpersonal processes, have direct effects on performance outcomes. The present research found work process to be a significant predictor of team performance, providing strong support for this conceptualization. On the other hand, the Yeatts-Hyten model indicates that interpersonal process affects team performance via its influence on work process. This prediction was not confirmed by the data: interpersonal processes was not a significant predictor of work process. There are several possible explanations for this finding. First, this finding suggests it is possible that treatment teams may display adequate interpersonal processes but still lack the other skills necessary to successfully manage team processes in the development and implementation of treatment plans. In other words, interpersonal processes may be to some extent necessary, as suggested by Yeatts and Hyten, but, as measured in this context, are not sufficient to predict team ability to manage treatment plans. Second, multicolinearity among the predictors may have suppressed the significance level of this path. Although no correlations exceeded .80, several approached or exceeded .70. Multicolinearity increases the standard error of the coefficients and makes it more difficult for the paths to achieve significance, particularly with a relatively small sample size. In short, only the strongest paths reach significance. Future research can help solve this problem with more substantial sample sizes and by operationalizing the independent variables to further reduce the level of intercorrelation.

This study found that team design elements significantly influenced work process factors. Team design was well predicted by the clarity of tasks among team members, a commonly shared vision of the team's mission or purpose, and to the availability of leadership support. These findings strongly suggest that when interdisciplinary treatment team members know what they are supposed to do and have leadership support for doing it, that the team will be better able work effectively and meet the performance standards required of them. Clearly defined individual and team tasks and goals is seen as critical to team effectiveness from both a conceptual (Hackman, 1987) and empirical perspective (Tannenbaum et al, 1992). The presence of these factors reduces intra-team conflict while improving work-related coordination. Leadership support is important because effective teams are dynamic entities

that evolve over time. Therefore the ability to meet short and long term performance objectives requires the presence of effective feedback mechanisms to allow the team as a whole and individual team members to make behavioral adjustments as needed. The present research suggests a key function of team leadership is to provide this mechanism: that is, to monitor and contribute honest feedback about performance.

Taken together, the findings of this study underscore the importance of attending to team design and work process factors in understanding effective psychiatric treatment performance. To further examine the role or interpersonal, team design, work process and other factors in the Yeatts-Hyten model, further research is needed. To more fully understand the complexity of SMT performance, this research should aim for larger samples in various organizational contexts that would enable group/team-level analyses with adequate statistical power.

Expanding Theories of Career Development: Adding the Voices of African American Women in the White Academy

Mary V. Alfred
Central Texas College

Many theorists have proposed models to explain career development. However, the appropriateness of these models for women and minority groups is being questioned. Changes in the composition of the workforce, to include the increased number of minority professionals in White dominated institutions, call for new ways of theorizing career development. Using a bicultural lens, this paper examines the professional development of five tenured African American women in the White academy.

Keywords: Career Development, Biculturalism, Black Women

Traditional career development theories, upon which many organizational career development programs are based, have been widely criticized for their exclusion of minority voices and for generalizing the White male developmental experience to that of minority groups (Cheatham, 1990; Kerka, 1992; Thomas & Alderfer, 1989). Samples used in the development of career theories are usually predominantly white middle class males, yet the results of those studies are used to explain choice and behavior among African Americans and other minority groups. As Cheatham (1990) argues,

> These theories and instrumentations incorporate no observations of (a) African Americans' considerable experience with structural or racial discrimination, (b) culturally-influenced perceptions of the meaning of work, (c) differential availability of career information and guidance, and (d) economics and labor market forces that affect African Americans differently. (p. 335)

Thomas & Alderfer (1989) confirmed, however, that the statistics on occupational status of racial minority groups suggest that race is a strong predictor of position in the labor market and career patterns. Despite that fact, traditional career models tend to ignore race as an important variable that influences and hinders career development of individuals in organizations.

Culture and Career

Although race is an important variable in the study of career development of minority groups, it cannot be examined outside of its cultural context. To do so would mean, for example, that there is a universal Black race that shares a monolithic culture. The study of career development, therefore, must incorporate the personal, cultural, and the structural contexts of the experience. According to Van Maanen and Barley (1985), "culture mediates between structure and individual realm" (p. 35). The cultural perspective will serve to integrate the psychological or personal perspectives of career with the sociological and structural aspects of organizations (Derr & Laurent, 1989). Not surprisingly, Deer & Laurent (1989), Schein, (1977, 1984a), Wood (1991), among others, propose that a cultural framework would best capture the social reality of developing careers.

Derr and Laurent (1989) note that career development theories tend to be fragmented, focusing on one variable at the neglect of others. Barley (1989), Derr & Laurent (1989), Kerka, (1992), Schein, (1978), Van Maanen (1977) and Wood, (1991)) agree that careers have both a subjective and an objective component and that both components must be integrated to capture the totality of the career. Schein (1975, 1993) conceptualizes the subjective career as the internal career and the objective career as the external career. Schein (1996) describes the internal career as an individual's self-definition of a career and is the person's interpretation of her work life and her roles within it. The external career, on the other hand, represents the formal stages and roles that are defined by organizational policies and societal expectations of occupational structures (p. 1).

In his study of careers, Schein (1977) found that most people form a strong self-concept that holds their internal career together even as they experience problems and changes in their external career. Hence his concept of "career anchors." According to Schein (1996, p. 2), a person's career anchor is his or her self-concept consisting of (1) self-perceived talents and abilities, (2) basic values, and most important, (3) the evolve sense of motives and

Copyright © 1999 Mary V. Alfred

needs as they pertain to the career.... Once the self-concept is formed, it functions as a stabilizing force, hence the metaphor of "anchor" and can be thought of as the values and motives that the person will not give up if forced to make a choice. Wood (1991) also notes, "the very idea of self-concept is culture bound" (p. 25). Therefore, in order to examine the self-concept and its role in career development, we must situate developmental experiences within a cultural context. Using a bicultural lens, this study examined the professional development experiences of five tenured Black women in the research academy. The purpose of the study was to explore the developmental experiences that contributed to their successful career in the White academy. The following questions guided the initial study:

1. How do Black women's early developmental experiences in the Black subculture and in the White dominant societal culture influence their professional development?
2. How do Black tenured female faculty interpret their experiences in the White-dominated culture of the research academy?
3. What adaptive strategies do Black female faculty employ to manage the White academic culture?

This paper focuses primarily on the perceived determinants of success (defined by tenure and promotion) among five African American tenured female faculty members at a predominantly White university in the Southwest. While the data point to the underrepresentation and to the poor status of Black women in higher education, little attention has been given to the successful women who have made it against all the odds.

Status of African American Women in the Academy

African American female faculty continues to be under represented in White dominated research universities (Carter & Wilson, 1992; National Center for Education Statistics, 1994). According to the 1993 Digest on Education Statistics, Black faculty comprised 4.7 percent of all full-time instructional faculty in higher education. Black women faculty made up 2.2 percent of the full-time faculty. Black women faculty who are associate and full-time professors made up 0.6 percent full-time faculty and 1.2 percent of all associate and full professors (p. 227). In addition, the National Study of Post Secondary Faculty (1994) revealed that 1.2 percent of the positions in public research universities and 1.3 percent of the positions in public doctoral universities were held by Black women (p. 15).

From the data, one can conclude that Black women are almost invisible in public research and doctoral universities. Those who are able to enter these institutions, however, find themselves at the bottom of the hierarchy and are among the least likely to be tenured (Collins, 1986; Howard-Vital, 1987; Silver, 1988). Furthermore, several researchers alert us to the negative experiences of Black female faculty as they struggle to gain access, inclusion, and tenure in white institutions of higher education (Granger, 1993; Humphrey-Brown, 1997; James & Farmer, 1993; Lopez, 1991; Smith, 1992). These writers speak of the alienation, isolation, and social marginalization that Blacks experience in predominantly White institutions. Despite these problems, some women have achieved tenure and promotion, becoming professionals of high regard at their institutions. It is critical, therefore, that the literature that informs career decisions in organizations include theories that address this group's career development experiences.

Theoretical Perspective

African Americans face the dilemma of double consciousness as they struggle to survive in two distinct cultural worlds--one White and one Black (DuBois, 1903; Hopkins, 1987). The Black life world consists of the Black community with its demands and expectations of professional women. The White life world is made up of the White institutional structures--the school and the workplace--within which African American women must interact and survive in order to be professionals.

To understand the historical process of these women's interactional experiences in their bicultural life worlds, I drew on bicultural life structure theory to guide the study. The bicultural perspective focuses attention on the interplay between the two cultures and its effects on the lives of racial minority workers (Jones, 1986). Wolfe, O'Connor, and Cary (1990) define life structure as

> the underlying pattern or design of a person's life at any given time.... The life structure is the bridge between one's inner workings and the demands of society, and is the product of both

> forces. It is the connection between self and circumstances.... It allows one to adapt to one's surroundings. (p. 958)

Valentine (1971) suggests that the bicultural model is best suited for the study of African American behavior within the mainstream culture. He further notes,

> The collective behavior and social life of the Black community is bicultural in the sense that each Afro-American ethnic segment draws upon both a distinctive repertoire of standardized Afro-American group behavior, and simultaneously, patterns derived from the mainstream cultural system of Euro-American derivation. Socializations into both systems begin at an early age and continue throughout life, and are generally of equal importance in most individual lives.... The idea of biculturation helps explain how people learn and practice both mainstream culture and ethnic culture at the same time. (p. 143)

A bicultural life structure allows the Black woman to hold on to her African American identity as she interacts with the White-dominated culture.

Methodological Perspective

Kent Seibert (1996) notes that people do not learn from their experience alone. He suggests that learning comes from the interpretation of the experiences. Therefore, to understand the process by which African American women make meaning of their professional development experiences in white-dominated institutions, I drew on the interpretive interactionist perspective. Habermas (1971) calls this the historical-hermeneutic paradigm. As Chovanec (1996) explains, "it is a study of the subjective and everyday experiences of human beings from their own point of view. In interpretive research, the emphasis of the study is on the meanings and interpretations of social worlds. The intent is to tap into complex social interactions and explore the subjective experience of the phenomenon" (p. 56). The interpretive paradigm, therefore, focuses on the participants' interpretation of their experiences.

Method

This study took a biographical or life history approach as each participant and I attempted the reconstruction of her bicultural lives to discover the sociostructural experiences contributing to her successful career in the White academy. Each woman's sociostructural experiences result from her interactions with the sociostructural life worlds of family, community, institution, and the wider society. In order to understand the totality of the women's experiences, I examined each life within its sociocultural contexts. Patricia Collins (1990) clearly articulated that the African American female cannot be viewed outside the context of family, community, and culture (p. 25). The interview guide was purposefully constructed to examine the career development experience as an integrated whole stemming from a multiplicity of experience occurring within various sociostructural contexts. The call for the study of career development as an integrated whole has been made by several researchers to include Derr & Laurent (1989), Hall (1996), Hall & Mirvis (1996). Hall (1996), for example, notes

> What is needed in career theory and practice is a more holistic view of the individual, one that encompasses all spheres of activity and all corresponding facets of personal identity. When we look at career and occupational experiences later in the individual's life, we need to see these experiences in the context of that individual's total life, encompassing all other important current roles and subidentities as well as hopes and dreams for the future. (p. 7)

The participants for this study consisted of five tenured African American female faculty from a major White research university in the southwest. The five study participants--Elizabeth, Jean, Kendra, Myra, and Sara--made up the total population of African American tenured female faculty at that institution. They ranged in ages 45 - 51 and came from diverse disciplines--Journalism, Social Work, Anthropology, and Engineering.

Analytical Techniques

To understand and interpret the historical experiences contributing to the professional experiences of African American female faculty in White research universities, I analyzed the data in three ways. First, I did a case analysis

of each woman's story and constructed a narrative of her experiences. Each case analysis and narrative was sent to participants for member check. Second, I isolated each significant experience and situated it within the sociostructural context of family, community, institution, and society. Third, I did a cross case analysis to discover the common themes in the participants' developmental experiences.

Overview of Findings

The results of a study of Black women's professional development in White dominated institutions suggests that the families built the foundation for the women's professional development by providing them with a nurturing environment within which to develop, high expectations and support to meet expectations, and a set of legacies or messages that sustained them in their professional development journeys. The Black community augmented each family's contribution by providing opportunities for Black self-definition, knowledge acquisition, and visibility. The White societal culture, through its privileged academic institutions, provided opportunities to fulfill dreams of professional careers. The study finds that although the White dominant culture was sometimes hostile and alienating, the women persevered knowing that opportunities for professional careers existed in that culture.

From the academic institutional life world, participants found support from the top levels of the administration and tenure support from their schools, from mentors, or from their professional organizations. They encountered enhancing opportunities to contribute to university and student affairs and for increasing their visibility in the academy. Among the disabling experiences were multiple role expectations, alienation from both institution and community, lack of support from colleagues, especially Black colleagues, and experiences of racism.

Discussion: Determinants of Success in the White Academy

The study results indicate that participants found success in the White culture through (1) positive self-definition in creating positive images and rejecting society's stereotypical images of themselves as Black women, (2) safe space, (3) knowledge of the culture and its role expectations, (4) visibility promoted by mentors and through participation in professional organizations; and (5) a fluid life structure that allows them to float in and out of various cultural and socioeconomic life worlds.

The Power of Self-definition

One of the most illuminating findings of this study is the role of positive self-definition in the participants' management of White-dominated cultures. "The basis for self-definition is one's sphere of influence from which self-concept grows" (Kerka, 1992, p. 3). Ella Louise Bell (1987) suggests that the Black woman's cultural affiliations have a definite impact on the development of her identity.

Analysis of the participants' developmental experiences suggest that the school, together with the family and the Black community, contributed greatly to building positive definition of the Black self. The Black schools, during the period of segregation, functioned not only as a transmitter of knowledge, but they had the expressed functions of building self-esteem, self-efficacy, and of preparing students to enter and to become successful in the White world. These were accomplished partly through implicit and explicit messages about Black self-worth. Core themes running through their messages were that they were just as good as Whites and their Black skin did not make them inferior. Jean's band director, for example, was very influential in the development of her Black cultural identity and positive self-worth. As she recalled,

> My band director was an influence on all of us in the band because he would talk to us about getting better than what we are, but it was always in reference to White people. He always talked about advancing and improving ourselves because we were Black, and you know, we had to be better.

Parents and community members transmitted similar messages about being Black in a predominantly White society. They prepared the youth for the debilitating experiences they might encounter in the White world. Kendra's parents, for example, told her, "you will experience racism, and you will be in situations where people will not want to sit next to you. Do not worry about it; remember that you are just as good as they are. The only difference is the color of your skin."

Although they were confronted with White domination and oppression during a period of total segregation, African Americans adopted what Collins (1991) and hooks (1990) call *a culture of resistance* in order to create a social reality of Black equality and positive cultural identity. Consequently, the participants, through implicit and explicit messages from family, community, and school, developed a cultural identity that formed a lens through which they viewed themselves in relation to Whites. They did not see themselves as inferior to White people, but as different from them, and that difference did not make them inferior. This perception of "different but equal" was found to be critical to the participants' perception of their place in the academic institutional culture.

Use of Safe Space

The use of a safe space was found to be a method by which the women preserve their constructed definition of self when the environment becomes disconcerting. According to Ward (1995),

> The safe space serves as a prime location for the Black woman to resist objectification as the Other. In safe spaces, as domination is seldom the prevailing operative, Black women may, theoretically, freely function and do or be that which she pleases. (p. 153)

Ward (1995) also notes that the predominantly White institution does not provide any inside safe spaces wherein Black women are truly free to develop and express their self-constructed knowledge of their Black womanhood. The findings from this study do, however, indicate that the participants were able to identify and access places or people in the Black community where their objectification as the Other was minimized. bell hooks (1990) refers to these safe spaces as "homeplace." She describes homeplace as

> a safe place where Black people could affirm one another and by so doing heal many of the wounds inflicted by racist domination.... We can make homeplace that space where we return for renewal and self-recovery, where we can heal our wounds and become whole. (p. 42)

Elizabeth, for example, resists institutional marginalization by retreating to the safe place she has created in her home. As she explained,

> I won't allow myself to feel marginal at this university. I guess if this meant more to me, if it were my whole life, then perhaps I may have a different view of it; but it's only part of my life.... I love my work, but this is not my main life.... I am very happy with my family. I have my husband and my daughter and we are very happy; we have lots of fun together. We have a beautiful home to come to. This is not my only reality. When this becomes too much, I can go home and forget it, at least for a while.

Sara's safe space, on the other hand, consists of her childhood neighborhood where she grew up within an all Black academic community. Going back to her community gives her a sense of wholeness and reminds her of the support, the love, and the safety she received from the family and community. This is particularly important to Sara as she works in an environment where she sometimes feels like an outsider. As she explained,

> I think the times I feel like an outsider are really when I go to meetings in which I don't know anybody else, like some of the committees that I serve on. Sometimes I go, and I get the feeling when I walk in that there is a surprise that I am there. I hear some of the interactions that suggest that some of the other faculty attending these meetings know one another. Those are the times that I feel like an outsider because I don't know anything about them, and they don't know anything about me.... When we go home, there is such a feeling of well being. It feels good to be there. We still know the people, and they know me because of my father. The neighborhood is still predominantly Black. I try to go back at least once a year to get back in touch with who I am and from where I came.

Retreating to a safe space is a method of resistance that Black women embrace to escape forces of oppression prevalent in the dominant society. The immediate and extended family, churches, African American community organizations, and even the individual psyche have been found to be important locations where African

Americans retreat to safety. This safe place becomes a house of refuge where Black women can reconstruct any image of herself that has been threatened as a result of her interactions within White dominated institutions.

The Power of Knowledge

The power of knowledge was found to be very significant to Black women's career development in an academic culture that professes the pursuit, creation, and disbursement of knowledge. The findings indicate that knowledge of the academic culture and knowledge of role expectations contributes to Black women's ability to meet cultural expectations.

Knowledge of Academic Culture

The culture of the academic profession is based on the concepts and symbols of academic freedom, the community of scholars, collegial governance, individual autonomy, and service of society through the production of knowledge, the transmission of culture, and education of the young (Clark, 1984). Participants placed great emphasis on the importance of cultural knowledge in successfully managing the academic culture. Their knowledge of the culture was first enhanced through their role performance as teaching and/or research assistants and through relationships with mentors and other significant members of the culture. Elizabeth, for example, said that her mentor was grooming her for the academic career and giving her a visual imagery of the academic culture. As she explained,

> He was bringing me along, even though at the time, I didn't know that's what he was doing.... He gave me a picture that exemplified an ideal of wouldn't this be great, working with ideas, working with graduate students. Wouldn't this be great not to have a full-time job?

By working with her mentor, she had a picture of life in academy. Elizabeth further suggested,

> During the Ph.D. program, you need to get a teaching assistantship or a research assistantship, a job that will connect you with other professors if that is possible. Those of us who had jobs within the university were the insiders; we knew the faculty, and we knew the culture.

Through their relationships with significant members of the culture, the participants learned its rules and expectations, and such knowledge facilitated their membership into the culture. Myra, in referring to her present institution, noted, "I don't feel like an outsider in the university because I understand how things run here." Her knowledge of the way things work enables her to successfully manage expectations of the job.

The socialization process of the five study participants was facilitated through their participation as students and through their insiders' positions as assistants and proteges of influential members within the culture. Their early interactions with significant members of the culture gave them a competitive advantage for developing the competency necessary to successfully meet cultural expectations.

Knowledge of Role Expectations

Research studies on the process of tenure in research universities often reveal the lack of knowledge that participants have about the process. Menges and Exum (1983), for example, note that many faculty say that the criteria are unclear, inappropriate, or unrealistic. In a more recent study of junior faculty's perception of the tenure process in research universities, Verrier (1992) found many of the participants were unclear about the process, had a preoccupation with knowing where they stand in the process, and had a craving for specific indices or clearly defined road maps. Contrary to the findings of his study, this study found that the women had clear knowledge of the cultural expectations with regards to the tenure process. They knew the political workings of the process.

The women came in to the academy with the awareness of its cultural rules. Although they found some of the rules inappropriate, they chose to follow the rules to ensure their success in the culture. When Jean and I were discussing the issue of cultural expectations, she said,

> I always said, even before I went up for tenure, I know the rules of this game that I have chosen to enter, like them or not, these are the rules. If I want to succeed in this system, then I have to abide by the rules.... Know the rules and play the game by the rules.

Knowledge of the rules enhanced Jean's ability to meet the expectations that guided the tenure process. Myra also articulated the importance of playing the game by the rules. She said, "There are rules, follow the rules." To Myra, knowing the culture and its expectations means knowing not only the explicit but also the implicit expectations that the culture has of Black women. She noted, "You really have to do what you are supposed to do, and you have to do a lot of it because being an African-American, people are gunning for you. Practically everybody is gunning at you." Myra is suggesting that the Black woman should exceed cultural expectations in order to avoid the guns of others in the academy. The message, "in order to be equal, you have to be better," is part of her ancestral legacy and it is a constant life script after which the professional Black woman patterns her life.

The Power of Visibility

Although Black women are rendered invisible by virtue of their femaleness and their Blackness, successful Black women are rendered highly visible by their institutions. As one participant said, "The University has my face plastered all over campus." The development of visibility started in the family and community life worlds, was promoted in the White institution through mentoring relationships, and enhanced by the employing institution and through the women's participation in regional, national, and international organizations. The resulting effects of such visibility are the opportunities they provide for career development and enhancement.

Kendra noted that one's visibility within her academic community becomes crucial at review time. She said,

> You need to be visible in the community that you say you are an expert in. You need to be visible at your national conferences and in your publications. They ask other people who are experts in the field, "What do you know about this person?"

The findings suggest that for one to become powerful in the academy, she has to be known, and in order to be known, she must be visible within her professional community.

Fluid Life Structure and Bicultural Competence

An individual's mode of participation within her various sociostructural life worlds depends upon the fluidity or rigidity of the life structure. This study found that the participants' success in the academy is partly due to their fluid life structure, which enables them to float in and out of their various sociocultural groups. By having a fluid life structure, the participants were able to navigate their bicultural worlds with little of the strain and stress Bell (1987) found associated with biculturalism. They saw their bicultural lives as interconnected rather than separated. When I asked Kendra, for example, about the duality of her life, she said,

> No, I don't have a dual life. This is all my life. What I am finding is that we may have some cultural uniqueness, but what has brought us together is our work. My professional and personal life is just a continuum.

Jean, on the other hand, agreed that she had a Black life and a White life, but she did not see any distinct separation between the two. As she remarked, "I guess there is a Black life and a White life. Work is White and everything else is Black, meaning social contacts and all that, but that is all my life; I cannot distinctly separate the two."

Sara's comments also indicate her inability to distinctly separate her world into a Black world bounded off by a White world. She noted,

> When I go home, it is really totally apart from the university world. What I am in my private life at home, I am still connected to the university in a sense that I am writing and doing things related to my work. I am just not connected on a social basis.... I think I am a part of both worlds. It is hard to separate the two. It is all my world.

Seelye (1994) suggests that a truly bicultural person acknowledges that she is not merely 50 percent X and 50 percent Y, but unique blends of X and Y with a variety of successful behaviors to choose from when dealing with X's and Y's (p. 29). He notes that the bicultural person does not deny the influence of one or another culture on her character but sees her life as a composite of all experiences originating from her various life worlds.

The power of Black women to pattern their mode of interactions to fit their Black and White life worlds is what La Fromboise and Associates (1993) term bicultural competence. They suggest that individuals living in two cultures may find the experience to be more beneficial than living in a monocultural lifestyle (p. 402). They also note that to be biculturally competent, one must possess a substantial degree of personal integration and individuation to avoid the negative consequences of a bicultural living situation. The participants of this study were found to have high self-esteem and Black cultural identity, elements that Seelye (1994) finds necessary for becoming biculturally competent.

Conclusion

The findings from this study support Schein's (1978, 1993) theory of internal and external careers and his concept of career anchor. Much of the dimensions of the developing career that emerged from the study can be organized as the internal or external career. Schein's notion of internal career represents the individual's career self-concept or the meaning she makes of her career. The internal career for these five participants is represented by (1) their positive self-definition which is anchored in cultural identity (2) their management of such definition by finding a safe space where they can reclaim any aspects of the constructed self which, by their perception, may have been threatened as a result of their interactional experiences, and (3) their fluid life structure and bicultural competency which allow them to successfully navigate their bicultural life worlds and to meet the expectations of both worlds.

Their external career, according to Schein (1993), refers to the actual steps that are required to progress through an occupation. The participants external career was facilitated by (1) their knowledge of the academic culture and its expectations, (2) socialization into the culture, which was facilitated by their mentoring relationships with significant members of the culture, and (3) visibility within the academic profession.

The women's career was found to be anchored in their self-definition. According to Schein (1993), "The career anchor is that one element in a person's self-concept that he or she will not give up, even in the face of difficult choices.... The anchor is the self-image" (p. 24). The women were found to have a strong sense of self, which was anchored in the Black culture. Their Black cultural identity can be considered as the one element that they would not give up, even if they were faced with difficult choices.

The Relationship Between Selected Variables on Diversity and the Implementation of Diversity as Successful Corporate Culture Change Programs

Clarence E. Whittenburg
Sealed Air Corporation

Dennis G. Tesolowski
Melissa H. Marcus
Clinton H. Isbell
Clemson University

Demographers sounded the alarm in the late 1980s alerting corporations that by the year 2000 white males would make up only 45% of America's workforce. Companies concluded that they needed a way to manage multiculturalism and, as a result, workforce diversity program initiatives were born. The purpose of this study was to identify variables that are key to the successful implementation of diversity initiatives as culture change programs.

Keywords: Training Diversity, Diversity Backlash, Affirmative Action

As we approach the next millennium, major corporations are increasingly reliant upon a workforce that is more diverse in its composition of culture, ethnicity and gender. Consequently, the marketplace is being redefined along global lines which add complexities to the successful conduct of business. Many organizations across the American landscape are creating diversity programs for the purpose of properly responding to changing conditions in order to maintain or gain a competitive advantage (Beilinson, 1991; Cox, 1993; Gerber, 1990; Lamb, 1991, and Purnell and Tervalon, 1991). In an effort to prepare their employees to meet these challenges, major corporations have instituted workforce diversity programs. Rarely do we see a solution becoming the problem, but when improperly managed, workforce diversity programs can produce undesirable results. Negative results measured primarily in the form of backlash may be experienced by white males, females and/or minorities who may feel that diversity efforts unjustifiably neglect their needs and/or portray them in a less than positive light. These individuals may feel unjustifiably excluded or included in the workforce diversity initiative and may feel that there is a lack of organizational commitment to the diversity effort (Thomas, 1991).

Paradigm shifts in the composition of the workforce, emergence of a global marketplace and economy, and technological change, among others, are in combination prompting corporations in America to rethink their conduct of business (Fine, Johnson, and Ryan, 1990). Of paramount importance, is the challenge of harnessing the human resources potential of the workforce to service the needs of a clientele that increasingly is of equal or greater diversity (Griggs, 1995; Thomas, 1991, 1996).

Problem Statement and Theoretical Framework

Past research in the field of corporate diversity programs has yielded several questions relating to the future of such programs and the basis from which they can be guided. The external impact of diversity on the workplace is somewhat clear; however, the research findings are not nearly as conclusive with regard to the effect on employees within these organizations nor does it delineate how people can work together more effectively in order to cope with these changing realities (Marshall, 1995).

The review of the literature established that demographic changes occurring in the American workplace have profound implications for the way we think, feel and see the world around us and thus, how we will staff and govern organizations and businesses in both the near and distant future (O'Reilly, Caldwell, and Barnett, 1989). Many programs include EEO/Affirmative Action elements but one must note that diversity is not a synonym for affirmative action, nor is it a code word for equal employment opportunity (Thomas, 1991).

This study investigated the success of introducing diversity initiatives into organizations as cultural change programs within Fortune 250 companies. In actuality, this study was designed for the purpose of establishing the relationship between selected variables on diversity and the implementation of diversity as successful culture change programs. The research focused on corporate diversity implementation programs and incorporated a self-reporting questionnaire technique in order to determine the effect of such programs on the stated variables.

Research Hypotheses

Based on the review of literature, what is known about industry practices, and the benchmarking exercise, the focus of this investigation was formalized in the following null hypotheses.

H_{01}: There is no relationship between the period of existence of workforce diversity programs and the level of diversity present in the workforce.

H_{02}: No relationship exists between the number of training hours and the extent of reported backlash.

H_{03}: No differences exist between IMPCR, IMPCI, IMPCUST, IMPEHS, IMPPROD, IMPACC, and IMPSUB and their impact on backlash.

H_{04}: No relationship exists between the inclusion of diversity management goals in managers' performance evaluation and reported backlash.

The following anacronyms may be defined as follows: community relations (IMPCR), company image (IMPCI), meet the needs of customers (IMPCUST), enhance employee skills (IMPEHS), increased productivity (IMPPROD), to provide access to wider skills and talents in the labor pool (IMPACC), and substitute for affirmative action (IMPSUB).

Methodology

Research Design

This survey research included testing hypotheses to identify the relationship of selected variables on diversity and the implementation of diversity as successful cultural change programs. The study was designed to answer four main research questions with the goal of contributing information to the body of knowledge regarding the successful implementation of diversity as cultural change programs.

Sample

The population for this study consisted of Fortune 250 companies. Fortune 250 companies represent the upper half of the 500 largest publicly traded United States firms published by Forbes Magazine which is a trademark for some of the largest industrial corporations in the United States. Companies included on the Fortune 500 list are those companies that are considered to be well-run organizations. The researcher chose Fortune 250 companies due to economic factors and ease of data collection and data processing.

Seventy-four (30%) of the Fortune 250 companies responded to the survey instrument. Fifty-one of these 74 respondents (68%) reported having implemented a workforce diversity program. These 51 companies had an average workforce of 32,467 employees. Most respondents held titles such as Vice President, Human Resources; Director, Human Resources; Manager, Diversity/EEO; Sr. Vice President, Corporate Diversity; or Director, Work Force Diversity.

Research Procedure

The questionnaire, which was developed for this investigation, was based on the findings of a "benchmarking activity". This benchmarking phase of the investigation included visits to five of the "best-in-class" corporations and a preliminary survey with 12 selected corporations. During this phase of the study the researcher was primarily interested in determining if a set of "best-in-class" variables existed that could be further studied and field-tested.

The questionnaire was developed in order to collect demographic information, information regarding components of diversity programs and how they are perceived, and information related to how diversity is being managed. Prior to the distribution of the final questionnaire, the content was analyzed by a panel of experts and the instrument was piloted with a group of 14 companies. The pilot study insured that all items could be interpreted by respondents and that the data collected could be suitably analyzed.

Each of the Fortune 250 companies were contacted by telephone in order to stimulate involvement. Next an introductory cover letter containing the purpose of the study, a request for cooperation, and a promise of anonymity was mailed to all companies. Respondents who chose to identify themselves were also promised a copy of the results of the study.

Pre-stamped, self-addressed envelopes were also provided with each survey. All surveys were mailed to an identified contact person with a request to return the survey within three weeks. Follow-up calls were made two

weeks after the initial mailing in order to remind participants to return the completed surveys. All 250 respondents were asked to complete the survey based on his/her knowledge of their organization and their workforce diversity program. Participating companies were also informed that questions 1 to 12 could be answered by all organizations, regardless of the implementation stage of their diversity initiative.

Data Analysis Procedures

Correlation analyses were used to test the first and second null hypotheses using the Pearson product moment correlation. Testing of the third null hypothesis required the use of multiple discriminant analysis with Box's M test and Wilkes' Lamda and univariate F ratios to determine the level of significance of individual variables (Hair, Anderson, and Black, 1995). The fourth null hypothesis was tested using chi-square.

Results and Conclusions

The results and conclusion of this study must be reviewed in light of the limitations of this investigation. The study only surveyed Fortune 250 corporations and did not focus on industry type. Furthermore, the study focused primarily on broad variables. Finally, the review of the literature indicated that this study is one of the first of its kind of this magnitude and that diversity initiatives are relatively new in American industries.

Results and Conclusions

Research Analysis

Fifty-one (68%) of the 74 respondents reported having implemented a workforce diversity program. Subsequently, all analyses were based on a sample size of N=51. The survey instrument instructed respondents to list the percentage of women and minorities currently working in one of three categories: management, professional jobs, and sales positions. Respondents were also instructed to use the standard EEO definitions when responding to the survey.

Correlation analysis was used to evaluate the relationship between period of existence of the workforce diversity program and the amount of diversity present in the organization. Using the Best-Kahn method (1986) for evaluating the magnitude of a correlation, the null hypothesis (H_{01}) was rejected in favor of the research hypothesis (for each workforce position) which indicates that a positive relationship exists between the period of existence of workforce diversity programs and the level of diversity present in the workforce for women and minorities.

This evidence suggests two possibilities: 1) given time, workforce diversity programs can be effective tools in influencing a more diverse workforce in terms of the employment of women and minorities in management, professional, and sales positions or 2) as the workplace becomes more diverse, workforce diversity programs are becoming more prevalent.

With regard to null hypothesis H_{02}, respondents were asked to indicate the level of backlash experienced as a result of having implemented a workforce diversity program from "not at all" to "a great extent". Backlash is defined as lack of commitment to the diversity effort which is most often associated with white males, females, and/or minorities as indicated by Thomas, 1991. Similarly, respondents were asked to indicate the number of diversity training hours provided to officials and managers, professionals, and sales workers. The data reported in Table 1 delineates the relationship between training hours and backlash.

Table 1
Correlation Analysis of Hours of Training and Backlash (N=51)

Workforce Population	Pearson Product Moment Correlation Coefficient	Strength	Significance	Reject H_0
Officials & Managers	-.089	Negligible	.53	No
Professionals	.033	Negligible	.82	No
Sales	-.133	Negligible	.35	No

As indicated by the data in Table 1, this investigation failed to reject the three null hypotheses associated with the relationship between the number of workforce diversity training hours for officials and managers, professionals, and sales workers and reported backlash. Therefore, the null hypotheses of no relationship were retained. This is an indication that (for officials and managers, professionals and sales employees) an increase or decrease in the number of diversity training hours has no significant impact on the amount of reported backlash.

Null hypothesis H_{03}, relates to items in the survey instrument asking participants to state the importance of seven diversity issues related to the implementation of diversity programs. Participants were asked to rate the importance of the following variables with a rating of "1" being of low importance and a rating of "5" being of high performance, community relations (IMPCR), company image (IMPCI), meet the needs of customers (IMPCUST), substitute for affirmative action (IMPSUB), enhance employee skills (IMPEHS), increased productivity (IMPPROD), and to provide access to wider skills and talents in the labor pool (IMPACC). Since the dependent variable (backlash) was an ordinal variable and the independent variables were interval, discriminant analysis was utilized as the appropriate statistical technique.

Since the objective of this investigation was to determine which of the independent variables are the most efficient at discriminating between more and less backlash, a stepwise procedure was used. The Mahalanobis D^2 measure was used with the forward stepwise procedure. The stepwise procedure starts with all of the variables excluded from the model and selects the variable that maximizes the Mahalanobis distance between the groups (Hair, Anderson and Black, 1995). The Mahalanobis distance is a distance index between groups that take into consideration group variance-covariance structure. Variables were included in the model based on their discriminating powers. The results indicate that five variables entered the model and were the best discriminators based on their Wilks' Lamda values.

Because this is a four-group discriminant analysis model, three canonical discriminant functions are calculated to discriminate between the four groups. The data in Tables 2-4 indicates that function one is the only one with rho < .20. However, function one accounts for 62.89% of the variance.

Table 2
Summary of Stepwise Discriminant Analysis (N=51)

Step	Variable Entered	Wilk's Lambda	Between	Groups
1	IMPPROD	.90806	0	1
2	IMPSUB	.84928	1	2
3	IMPCI	.74361	0	1
4	IMPCUST	.69086	1	2
5	IMPEHS	.64551	0	1

Table 3
Canonical Discriminant Functions

Function	Percent Variance	Canonical Correlation	Significance
1	62.89	.4834	.1752
2	24.11	.3235	.4524
3	13.00	.2434	.4268

Table 4
Standardized Canonical Discriminant Function Coefficients

	Function 1	Function 2	Function 3
IMPCI	.57	.63	-.02
IMPCUST	.44	-.60	-.00
IMPEHS	-.23	.04	1.14
IMPPROD	.75	-.36	-.44
IMPSUB	.44	.47	.16

The data indicates that the discriminant function achieves a high degree of classification accuracy with a hit ratio of 45.10% compared to a 25.0% chance ratio (1-4 categories of backlash). The final measure of classification accuracy is the Press's Q. It tests the statistical significance that the classification accuracy is better than chance (Hair, Anderson and Black, 1995). The calculated Press's Q value for this investigation is:

$$\text{Presses Q} = \frac{[51 - (45 \times 4)]^2}{51\,(4 - 1)} = 109$$

Since the chi-square critical value at the .001 level of significance is 10.827, the discriminant analysis can confidently be described as significantly predicting group membership.

An examination of the data in Tables 2-4 provides an indication that two variables [improve productivity (IMPPROD) and substitute for affirmative action (IMPSUB)] contribute somewhat in discriminating between groups. A closer look at function one indicates that the variable "to improve productivity" (IMPPROD) impacts heaviest on reported backlash (.75). Based on the significant improvements in classification accuracy, the investigator rejects the null hypothesis in favor of the research hypothesis which states that linking diversity to AAP will have a greater impact than other benefits/issues on the amount of reported backlash experienced in the workplace.

Finally, with regard to H_{04}, survey participants were asked to answer "yes" or "no" to the question: Is progress toward meeting workforce diversity goals included in a manager's performance evaluation? They were also asked to indicate the level of backlash resulting from their workforce diversity programs by checking one of the following levels: not at all, to a little extent, to some extent or to a great extent.

To test this null hypothesis, the investigator considered the variables under investigation were both nominal variables, one with more than two classification levels. A 2 x 4 contingency table was constructed and a chi-square distribution was employed as the statistical measure. Since the chi-square distribution is a non-parametric test, assumptions of normality and homogeneity of variance are assumed to be adequate for this evaluation (Ary, Jacobs, and Razavieh, 1985). The test statistic to be computed for the 2 x 4 contingency table is chi-square = 3 degrees of freedom. Therefore, the critical value of the test statistic is chi-square =7.815. The calculated statistic was nonsignificant, chi-square (3) = 4.57, rho > .05. The null hypothesis is retained, and the conclusion is that no relationship exists between inclusion of diversity management goals in a manager's performance evaluation and reported backlash. The evidence suggests that backlash is unaffected by whether or not diversity goals are included in managers' performance evaluations.

Summary

In summary, the research investigated provides a clear indication that there is a strong relationship between the level of diversity in the workforce and the maturity of workforce diversity programs. The results indicate that diversity training has little or no impact on the level of reported backlash which could be attributed to the quality of the training or the duration of the training.

Secondly, some diversity issues have a greater impact on the level of reported backlash than others with programs serving as a substitute for affirmative action and those that concentrate on improving productivity being the most likely discriminators. Finally, including diversity management in the managerial performance evaluation process does not increase nor decrease the level of reported backlash. At this point, including diversity in managers' performance evaluations appears to be a non-issue.

The literature indicates that there are three primary reasons why organizations faced with demographic changes undertake cultural diversity programs including affirmative action, valuing diversity, and that diversity is linked in important ways to organizational performance improvement. This study supports the theory that workforce diversity initiatives that are closely aligned with affirmative action initiatives are more likely to result in backlash than those that are aligned with managing diversity as a business necessity.

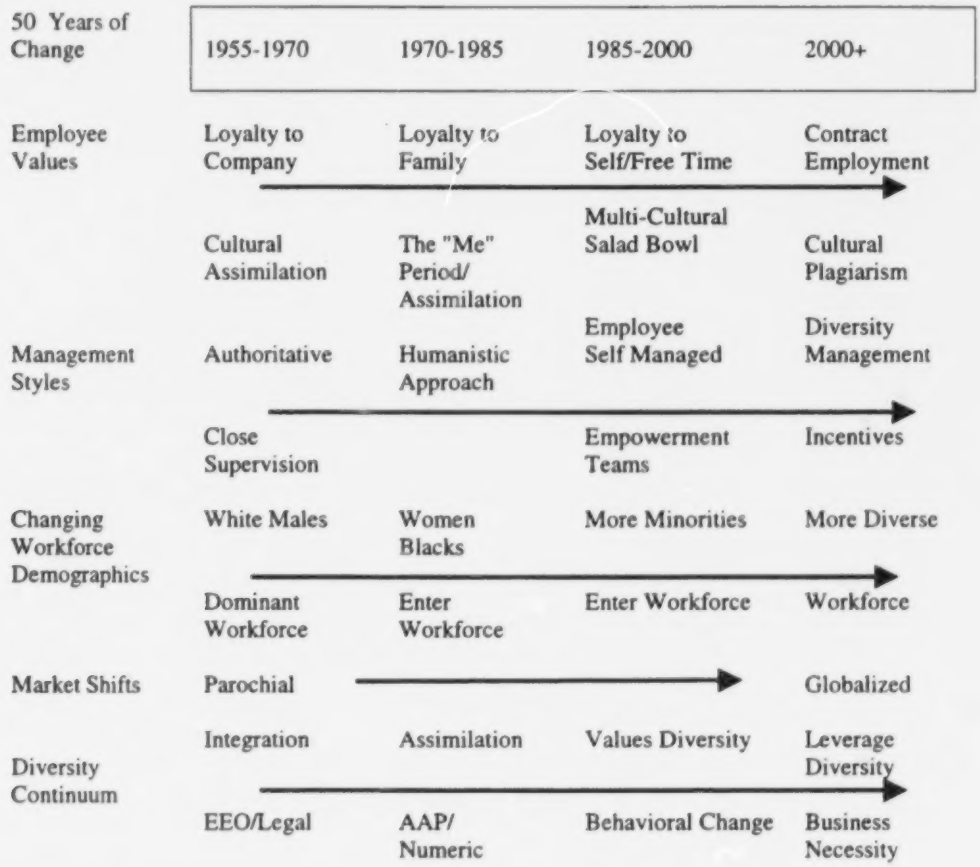

Figure 1: Diversity as business necessity

This investigation led to the development of a model (See Figure I) that views diversity as a business necessity. This model suggests that in most organizations management is responsible for maximizing investments in human and other capital. That is, it is management's responsibility to assure that goods and services are rendered at high quality levels while controlling for the cost of human (and other) capital. The actual measurement of the return on human capital may be accomplished in several ways. This model suggests the use of gross margins. Ideally, we would want gross margin per employee to increase with management interventions such as training, development, organizational change (centralized vs. decentralized services), technological breakthroughs, automation of manufacturing processes and systemic approaches to functional activities and diversity culture change programs. However, management's ability to implement many of these productivity initiatives is dependent on employees' ability to understand and function in a given environment and is heavily influenced by organizational culture and value systems. In order to be successful, companies must transmit a set of values that can be embraced at every level of the organization (Rhinesmith, 1993).

This model suggests that managers and organizational leaders' ability to increase the profitability of each employee is confounded by: changing management styles, shifting emphasis on employee rights, increased

workforce diversity, and changing employee value systems that may not be aligned with the value system of the organization.

Contribution to Knowledge in HRD

The scope of workforce diversity is enormous, covering all businesses and industries. The emphasis on managing diversity appears to be expanding as evidenced by the fact that 51 (68%) of the Fortune 250 companies participating in this study have appointed a department (or a portion of a department) to spearhead their workforce diversity initiative.

These findings, coupled with findings discussed in the review of literature, give rise to new and exciting implications in the area of workforce diversity programs. Individuals charged with the responsibility of implementing, funding, or enhancing current workforce diversity programs should gain valuable insights that will, hopefully, guide their efforts toward successful workforce diversity programs implementation.

Diversity Practitioners—Learning From Experience! Defining the Role and Related Competencies in an Emerging Field of Practice.

Terrence E. Maltbia
Teachers College, Columbia University

This paper provides a description of the process used to test the development and utility of a qualitative research model. The model was created as part of a doctoral dissertation, which explores the key experiences that represent the competency development process for diversity practitioners doing pioneering work in organizations. The paper argues that learning the requirements needed to perform in the role of diversity practitioner is a function of understanding the context, the relevant content, and the various processes associated with implementing diversity strategy.

Keywords: Diversity, Diversity Competencies, Diversity strategy

The dynamics of the new *global workspace* have resulted in the emergence of what some observers have called the *diversity industry* or the *diversity machine* (Judy & D'Amico, 1997; Lynch, 1997; Wheeler, 1995). Global markets with global corporations, producing global products and services by employees in global jobs characterize this emerging workspace. In addition, the projected diversification of the workforce, as both women and minorities enter the workplace in greater proportions, has fueled the rapid proliferation of many, often hastily prepared, diversity practitioners whose objective is to help organizations achieve the purported promise of diversity.

Problem Statement and Purpose

Problem Statement—Few comprehensive, well-structured studies on diversity practitioner competencies are present in the literature. Those reported tend to be part of research on broader diversity questions and issues. The emerging literature related to diversity is full of examples and models espousing linkages between productive diversity work climates and organizational effectiveness (Adler, 1986; Cox & Blake, 1991; Kanter, 1983; McLeod, Lobel, & Cox, 1991; Nemeth, 1985; Sandroff, 1988; Tannen, 1994, 1990; Triandis, Hall, & Ewen, 1965; Wright, Ferris, Hiller, & Kroll, 1995).

There is a growing body of literature presenting multiple perspectives for defining the meaning of diversity, as well as describing the various components of diversity in practice and related strategies for achieving its promise. In contrast, much of the literature that is available about diversity practitioners provide general categories with subjective descriptions of the practitioner's role. These categories are often based on quantitative survey research or the authors' conclusions drawn from actual experience (Baytos, 1995; Burkart, 1996; Carr-Ruffino, 1996; Cross, 1996; Gardenswartz & Rowe, 1993; Gant, 1996; Griggs & Louw, 1995; Wheeler, 1994, pp. 14-16).

Few of the authors writing about the role of diversity practitioners are explicit about the origins of their thinking, leaving the reader to accept their conclusions at face value. These general descriptions of qualifications and characteristics resulting from quantitative research or self-reports of practitioners provide a starting point for: (1) making selection and development decisions and (2) strategic planning and implementation; yet these descriptions lack the richness and detail that often result from qualitative, case study research.

Questions of quality control arise regarding the effectiveness of diversity practitioners, in part, because of the newness of the field. This researcher posits three additional explanations for quality control challenges in this emerging field of practice: (1) the role requirements are not clearly defined; (2) we don't specifically know what diversity practitioners' self-perceptions are or what they actually do in practice; and (3) there appears to be a lack of clarity as to why diversity practitioners engage in a given set of action strategies in terms of conceptual grounding.

Purpose Statement—This paper presents a research model that has been developed as part of dissertation study on diversity practitioners. The intent of the research model is to examine how the role requirements for diversity practitioners are evolving in practice; and to identify the competencies believed to be associated with effectiveness in the role.

Copyright © 1999 Terrence E. Maltbia

Research Question and Rationale

The core research question for the dissertation is:

> *What set of experiences reflect or represent the diversity practitioner's process of competency development? What are the resulting competencies?*

Given the context of the broader dissertation study, this paper responds to the question: *Can the research model presented identify the set of experiences that reflect the diversity practitioner's process of competency development?*

Rationale—Sixty-one percent of respondents to a Society for Human Resource Management survey indicated that diversity training is a "business necessity." This and other findings suggest that diversity training is increasingly becoming a part of the Human Resource Development (HRD) practitioner's responsibility. Just as the proposed benefits of workplace diversity initiatives are difficult to assess (especially quantitatively), so are the costs. One source estimates consulting fees ranging from $2,000 (per consultant for a one-day workshop) to well over $200,000 for a complete cultural assessment and diversity program (Lynch, 1997). These estimates do not include salaries and other expenses for internal personnel; nor the potential hidden costs associated with poor morale, conflict, and absenteeism that may result when diversity is not valued. The failure of an organization to create a productive diversity climate can also result in expensive litigation costs as a result of bias and discrimination claims.

Finally, there may be opportunity costs associated with diversity, for example a study of the Standard and Poors 500 Covenant Investment Management found that businesses committed to promoting diversity had an average annualized return on investment of 18.3 percent over a five-year period, compared with only 7.9 percent for those with the most shatter-proof glass ceilings (Recommendations of the Federal Glass Ceiling Commission, 1995, p.5). Diversity practitioners, both internal and external to the organization, often guide the design and implementation of diversity processes. It is this researcher's hope that the design of this study, and its findings, will make a positive contribution to Human Resource Development practitioners wishing to integrate diversity competence into their development platform.

Definitions of Terms and Key Concepts

Just what is a *diversity practitioner*? To answer this question, a number of terms and related concepts must be defined.

First, *What is the meaning of diversity*?—There are as many ways of defining this term as authors writing about the phenomenon. The literal meaning of diversity is the "condition of being different" (Webster). Taken in the context of the dynamic nature of human interaction, diversity can be defined as "unique mixtures characterized by similarities and differences" (Thomas, 1996). The *diversity as dimensions* framework provides a model for examining these unique mixtures of similarities and differences characteristic of human existence.

The primary dimensions of diversity encompass our inborn characteristics and other factors generally determined early in the life span. The elements (i.e., race, ethnicity, country of origin, gender, age, physical and mental ability, and sexual orientation) that make up the primary dimensions of diversity form an interdependent core of one's identity. People use these dimensions, often tacitly, when meeting others and determining "in-group" (others like us) and "out-group" (those who are different) status. *Secondary dimensions* of diversity can be viewed as mutable differences that we acquire, discard, and/or modify throughout our life-span and, as a result, are less salient to our core (e.g., education, occupation, income, parental status, etc.). *Organizational dimensions* of diversity resulting from our work roles are influenced by such factors as organizational level, classification (i.e., exempt, hourly, etc.), line of business, work content, location (e.g., corporate vs. field office), and union affiliation. The sum total of the three dimensions of diversity shape our identities as people, the frame or lens through which we view, experience, and act in the world. In short, diversity includes ALL OF US!

Second, *What is diversity in the workplace*?—Two watershed events served to place diversity on the radar screen in Corporate America. The first was the Hudson Institute's landmark study entitled "Workforce 2000: Work and Workers for the 21st Century" (Johnston & Packer, 1987) which highlighted a number of changes in America's workforce, mainly workplace demographics and a perceived "skills gap" between what a well-educated labor force needs to compete in a global economy and what skills they process.

The other was an article in The Wall Street Journal's Corporate Women column pointing out the invisible and impenetrable barrier between women and the executive suite, preventing them from reaching the highest levels of the business world regardless of their accomplishments and merits. Table 1 below presents five common organizational responses to diversity in the workplace.

Each approach differs along a number of key variables such as goals, motives, focus, benefits, and challenges. The primary driver for *Equal Employment Opportunity* (EEO) *and Affirmative Action* in organizations is legal compliance, therefore this approach focuses on racial and gender representation, in addition to other protected classes of employees, in all facets of employment. The *understanding differences* approach places its emphasis on interpersonal relationships across the various primary, secondary, and organizational dimensions of diversity.

The *valuing diversity* approach explores the extent to which a workforce composed of people with diverse, cultural backgrounds constitutes a valuable resource in helping corporations meet the demands of operating in today's global and multicultural business environment (Herbst, 1997). *Managing diversity* takes on a managerial perspective and focuses on the full utilization of the entire workforce regardless of difference. *Leveraging diversity* is a comprehensive strategy building on the previous four approaches. Leveraging diversity focuses on measuring the impact or outcomes of capitalizing on the talent of a diverse workforce (e.g., customer satisfaction ratings and successful penetration of diverse market segments).

Table 1
Organizational Approaches to Diversity in the Workplace

EEO & Affirmative Action	Understanding Differences	Valuing Diversity	Managing Diversity	Leveraging Diversity

Lastly, *What is a diversity practitioner*?—Each of the five approaches presented in Table 1 require movement within an organization at three levels; individual, group, and system. To varying degrees, each approach requires learning and change. First we must learn about the various cultural patterns that guide behavior in organizations and then we must work to change certain aspects of organizational culture to enhance effectiveness in inter-cultural and multi-cultural contexts. Diversity practitioners, while they differ in exact role requirements, work to assist organizations achieve their objectives by designing, developing, and implementing diversity interventions.

The Research Model and Analysis Process

The research model—this study applies a four-phase research process: (1) literature review and conceptual framework; (2) pre-interview data inventory/critical incident form sent to the study participants before the scheduled interview; (3) a 90-minute audio-taped semi-structured interview schedule; and (4) an emerging coding scheme/conceptual framework. I tested this model as part of the first round of my dissertation study with ten noted diversity "experts." *What constitutes a diversity expert?* In this study, an individual who contributes to and whose work is cited frequently in the literature on workplace diversity was considered an expert.

The diversity container framework—This framework (presented in Table 3) was used to transform the large volume of data in the literature on diversity into information. The result: (1) a catalog of the various ways diversity is defined in the literature; (2) descriptions of five approaches to addressing diversity in the workplace; and (3) content areas to explore using a pre-interview data inventory with "expert" research participants. The interview schedule applied during this study was designed to build on the findings from the literature review and pre-interview data inventory analysis by exploring the meaning practitioners (or experts) attribute to the experience of doing pioneering diversity work in organizations.

The expert interview schedule—Structured interviews were conducted in three parts: (1) Self-Q, that is soliciting questions that experts would ask internal diversity practitioners if they were conducting this study; (2) a series of open-ended questions about their role requirements as a diversity practitioner and the related competencies; and (3) reflective questions on the meaning the experts attribute to their diversity work (including generating two personal critical incident examples). The content and process of the expert interview schedule is presented in Table 2.

The analysis of the expert interview data—the process used to make meaning from the expert interview process included the following steps:

1. researcher review of interview transcripts (reading) with audio tape to ensure accuracy and to note follow-up clarifying questions;
2. research participants review of interview transcript and field notes (1st round member check);
3. researcher and participant address clarifying questions during follow-up telephone conversation;
4. researcher complete second pass noting emergent themes on margins of each transcript (focused on what Patton 1990, calls "indigenous concepts");
5. researcher complete third pass using the diversity container framework (compared literature with practice descriptions);
6. researcher use of Nudist qualitative research software to auto-code transcripts based on pre-interview data inventory demographics and sort transcripts by each key interview question from the structured interview guide (see Table 2); and
7. researcher develop case descriptions (or what Seidman, 1991 calls thematic presentations in third person descriptive style as suggested by Patton, 1990 & Merriam, 1988) for each participant (i.e., participant profile, definition of diversity, description of diversity approach including intended outcomes, and summary of key themes emerging from the critical incident segment) and distribute to each research participant for review and comment (2nd round member check).

Table 2
Expert Interview Schedule

Part 1: Questions	*Rationale/Probes*
It is evident that you are an expert on your own view of what constitutes success in this role. Therefore, to start, what I would like to do is have you ask yourself questions about the role of a successful diversity practitioner, the competencies needed to operate in the role, and how best to acquire such competencies. Please do not answer these questions, simply pose them as if you where interviewing someone else. While you are asking these questions, I will be recording verbatim and writing them down the best that I can capture them. If at any time you feel that you want to review what I have written, feel free to do so...Please, let's begin by asking the first question	Process Note: list the questions and review with participant; when the participant runs out of questions, inquire as to why this list of questions.
Part 2: Questions Q1. *How do you define diversity? Why?* Q.2. *What do you see as the primary role and related responsibilities of diversity practitioners? Why?* <u>Role</u> <u>Responsibilities and Tasks*</u> Q3. *What theoretical orientations or frameworks, if any, do you use to guide your practice* (interventions) *and why*? (content and premise reflection) Q4. *What specific skills, knowledge domains, and practices do you think successful diversity practitioners* (including yourself) *apply during their* (your) *work that have contributed to what you would consider to be exemplary diversity process outcomes in organizations* (i.e., competencies)? *Why?* Q5. *How do they (you) learn about the theory and practice of workplace diversity?*	*Rationale/Probes* Meaning the expert/practitioner attributes to the concept of diversity grounded in the belief that one's assumptions about the meaning of diversity will influence action strategies and approaches to the work. Engage the expert in context, content, & premise reflection (Mezirow, 1991). Understand the linkage between theory and practice (content and premise reflection) Content, conduct, and premise reflection. Direct questions about preparation and key experiences; how the learning is achieved in terms of strategy--formal, informal, intentional, or incidental; aim of learning)

Table 2 (continued)
Expert Interview Schedule

Part 3: Questions	*Rationale/Probes*
Q6. Now, I would like you to reflect on the meaning of your experience; that is, *What sense do you make of the experience of doing diversity work?*	Meaning making/learning from experience/reflecting on experience
Q7. *Given what you have said about the role of diversity practitioners, and the related competencies; where do you see yourself going in the future with this work and why?*	Forecasting on the future direction of diversity work/related requirements/implications for future competencies.
Q8. *Can you think of any "ah ha" experiences that caused you to rethink elements of your practice? If so, what are they? Why critical? Impact on practice?*	Learning from experience
Q9. *What are some examples of what you would consider exemplary practice in your experience* (or others) *as a diversity practitioner?*	Probes: What was the situation? Trigger? Intent or desired outcome? Hopes? Players? What was your role? Strategies/tactics? Actions? Why? Thoughts? Feelings? High-point? Low point? Outcomes? Results? Measure? Compare to initial intent? Have your views about what's important in diversity work changed as a result of this experience? About what constitutes effective practice? What would you do different next time, if anything? Why? What were your learnings as a result of this experience? What advice would you give to someone facing a similar situation?)

After completing this process with four expert participants (i.e., analysis steps 1-7), I conducted an inter-rater reliability session with two other colleagues in my dissertation cohort. A preliminary coding scheme for the study resulted from this process (see Table 5 and Table 6). This process resulted in the creation of an analytic framework to apply during the balance of the study presented in the preliminary findings segment of this article. This researcher claims the preliminary results are trustworthy based on design features such as (1) multiple round member check strategy; (2) triangulation of the data including primary source interviews, researcher observation, comparing themes emerging from primary sources with secondary sources; and (3) colleague inter-rater sessions.

Theoretical Foundation

This researcher's paradigmatic assumptions align with constructivism, that is a belief that the meaning of diversity is a human construction (Lincoln, 1990, pp. 67-87). This paradigm assumes that "what is known" about diversity or its reality, "exist in the form of multiple mental constructions, socially and experientially based, local and specific, dependent for their form and content on the persons who hold them" (Guba, 1990, p. 27). This implies in order to understand the requirements and related competencies associated with the role of the diversity practitioner the researcher (or inquirer) must interact directly with the participants (or the inquired) to co-create meaning. For this reason, a number of the diversity "experts" found in the literature were requested to participate in the first phase of the study.

The diversity container brings together three philosophical schools of thought in analyzing the performance and role of diversity practitioners including (1) structuralism or *context;* (2) phenomenology, or *content;* and (3) behavioralism, or *conduct* (Jackson, 1991, p. 38). In addition, the container was used to develop data collection and analysis tools. Table 3 presents the seven core questions that make up the diversity container.

Context—Placing the concept in a historical context can enhance our understanding of the diversity movement as a phenomenon. As demonstrated in Table 4, the evolution from *Affirmative Action* (AA) to *Workplace Diversity* can be positioned as representing a paradigm shift in our thinking about, and reacting to, a variety of individual

differences in this country over the span of four decades (Baytos, 1995; Carr-Ruffiono, 1996; Cox, 1993; Gardenswartz & Rowe, 1994, & 1993; Griggs & Louw, 1997; and Thomas, 1996).

Content—Surveying a number of the definitions of diversity in the literature, as well as those generated by this research, one of two components, or both, are embedded in the various ways of expressing the meaning of the concept: (1) as a *dimension* (or group of dimensions); and (2) as an *action* or *process* (i.e. acknowledging, understanding, and valuing differences; effectively managing and leveraging differences). In short, both theorists and practitioners conceptualize diversity as a *subject* (the "what") and/or a *verb* (the "how") capturing both static characteristics as well as dynamic processes.

Table 3: The Diversity Container
Critical Literature Review: Core Exploration Questions

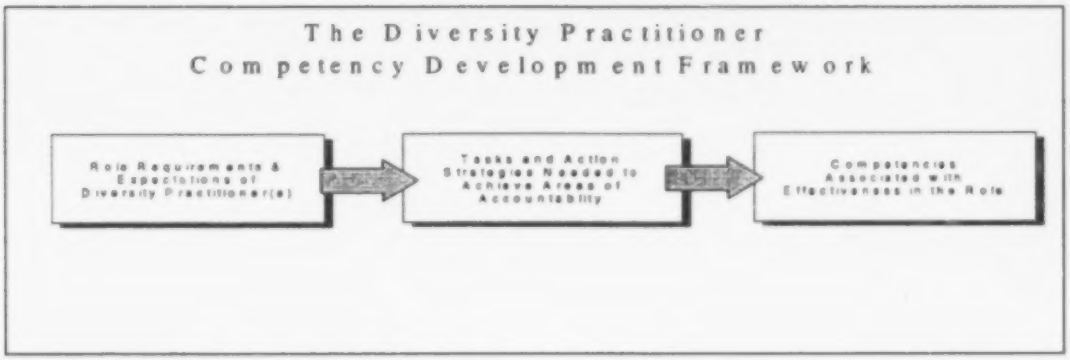
Element	**Context** *(The "Where & When" in time, place, & history; & Why)*	**Content** *("The What")*	**Conduct** *(The "How")*
Philosophy	Structuralism	Phenomenology	Behavioralism
Focal Questions	*Q.1: Why bother? What's the basic premise for diversity work?* *Q. 2:How do theorists and practitioners position the "business case" for diversity?* *Q. 3: What historical origins influence an author's thinking regarding diversity in the United States?*	*Q. 4: How are theorists and practitioners defining diversity?* *Q. 5: What are the key models or conceptual frameworks used to guide professional practice?*	*Q. 6: What resources or interventions are recommended by theorists and practitioners to do diversity work* (i.e., how do they translate theory into practice)?
Q. 7: How do theorists and practitioners define success (i.e., what are the expected results or outcomes)?			

Table 4: The Evolution of the Diversity Movement
Four Decades of Change

1960s	1970s	1980s	1990s
Era of Civil Unrest & Social Action	*Era of Affirmative Action & Tension*	*Era of Inclusion*	*Era of Cultural Transformation*

Conduct—Contextual and content elements of the diversity container frame the nature and form of the actions taken by diversity practitioners in the service of achieving workplace diversity objectives. The Diversity Practitioners Competency Development Framework below graphically demonstrates the approach applied in this study to gain an understanding of the process used for clarifying role-related competencies. The interview guide presented in Table 2 was designed by combining the three elements of the diversity container with the competency development framework. The collective insights gained by applying the diversity container resulted in the following working definition for the competency development process for diversity practitioners.

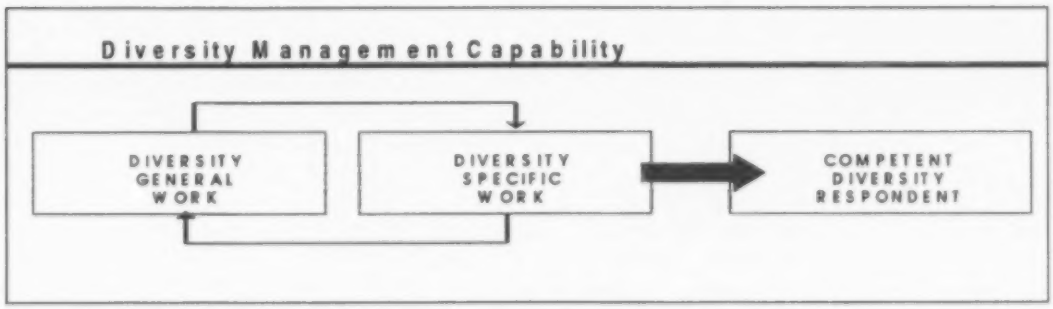
The process of learning, grounded in experience, that contributes to the diversity practitioner's ability to develop effective responses to the challenges, complexity, and opportunities associated with the role.



The Diversity Practitioner
Competency Development Framework
Role Requirements & Expectations of Diversity Practitioner(s)
Tasks and Action Strategies Needed to Achieve Areas of Accountability
Competencies Associated with Effectiveness in the Role

Preliminary Findings

The key preliminary finding emerging from this study is that the learning agenda for the development of a managing diversity capability involves a continuous interplay between diversity-general work and diversity-specific work (Hayles & Russell, 1997, p. 129; Hayles 1997-98; Thomas, 1996). Diversity-general work focuses on providing a context for diversity-specific work. In this way, diversity-general work builds the foundation needed to achieve the desired outcomes of any diversity-specific intervention. The ultimate aim of cycling back and forth between diversity-general and diversity-specific activities is to develop the capacity to construct competent responses to the challenges, complexity, and opportunities associated with situations involving diversity.



Diversity-General Work—Diversity-general work provides a foundation for a comprehensive diversity strategy and change process. In other words, this work should be a requirement for any diversity initiative or intervention. While necessary, diversity-general work is not sufficient for the organizational and cultural change needed to transform the complexity, conflict, and tension often associated with situations involving diversity to a source a competitive advantage. The activities associated with diversity-general work can be grouped into six clusters as displayed in Table 5. This insight resulted in a framework for analyzing the expert and later the internal diversity practitioner interview data.

First, conceptual clarity answers the question—*What is diversity?* Contextual awareness situates the diversity movement in its historical context and examines how various socioeconomic trends have placed diversity on the social, political, and organizational agenda in United States. In this way, contextual awareness work answers the "where, when," and to some degree the "why" of diversity.

BEST COPY AVAILABLE

To achieve sustainable change both the business case for diversity and one's personal rationale for engaging in the diversity management process must be clarified. There are a number of relevant models and theories which serve as guideposts to effectively applying diversity management in organizations (i.e., theoretical basis) that are part of the foundation of developing a managing diversity capability.

Foundational knowledge and skill go beyond defining diversity to working to understand and apply a set of basic concepts for influencing human behavior in organizations—the essence of diversity work. Finally diversity is not a spectator sport—it requires personal engagement. For this reason, a key element of diversity-general work is self-awareness.

Diversity-Specific Work—A key challenge for a practitioner during the early phases of the diversity management process is deciding where to start. There is often confusion around the need to position diversity inclusively and the complexity associated with trying to effectively address the multiple dimensions of diversity at once. What is clear is that if a practitioner or an organization were to attempt to address the infinite number of differences characteristic of human existence, very little, if any sustainable change would occur. In fact, most people (and organizations) would to get lost in the complexity. For this reason, after building a foundation with diversity-general work, it is necessary to then select one or more dimensions of diversity to apply the learning. That is, transform that learning into action. Table 6 presents the analytical tool that will be used to assess diversity-specific work in organizations.

Table 5: Six Clusters of Diversity-General Work in Organizations

Clusters	*Cognitive Domain* (Knowledge Areas—Head Work)	Behavioral Domain (Skill Areas—Hand Work)	Affective Domain (Attributes—Heart work)
Contextual Awareness	e.g., historical origins of dive movement	e.g., transforming practices, systems, & structures	e.g., accepts political realities of change agent
Conceptual Clarity	e.g., various definitions of diversity; classification schemes	e.g., argument skills—justifying, analyzing, & constructing positions	e.g., personal work around how prejudice and other assumptions impact the work
Business Connection/Case	e.g., macro-economic trends/understanding drivers	e.g., strategy development, measuring the impact	e.g., long term perspective
Theoretical Basis	e.g., Bennet's Developmental Model of Intercultural Sensitivity; Organization Behavior	e.g., administering, analyzing, and providing IDI feedback	e.g., constant pursuit to clarify one's philosophical orientation regarding diversity work
Foundational Knowledge and Skills	e.g., Workplace Diversity Process; OD; OT; and Adult Learning Theory.	e.g, diagnostic skills—applying FK during CAs, ORAs, TNAs, etc.	e.g., reflective practitioner, continuous learning/ balance challenge & support
Self-awareness and Self-work	e.g., learning style, facilitation style, consulting style, life history	e.g., administer & interpret various self-awareness instru.s	e.g., viewing self as instrument of change

Summary

While the results are preliminary, the early findings emerging from this Diversity Practitioner Competency Study support the utility of the qualitative case study research model to examine a sample of acting participants in this emerging field of practice. The results from the expert sample align heavily on the diversity-general side of the two dimension analytical framework presented in the preliminary findings section of this article. Early analysis using transcripts from the "internal practitioner" sample appears to provide more details on the diversity-specific side of the framework, this may be due to, in part, the specific, and task oriented nature of internal practitioners. The experts in this study are authors, consultants, and advisors to internal practitioners.

The methodology described herein, and the process in which conference attendees assigned to this symposium will participate, will make a strong contribution to the trustworthiness of the broader dissertation study on Diversity Practitioner Competencies.

How Action Learning Builds the Learning Organization: A Conceptual Analysis

Michael Marquardt
Ty Alexander
George Washington University

Keywords: Action Learning; Learning Organization; Organizational Learning

Marquardt and Carter (1998) observe that "perhaps action learning's most useful role is in creating learning organizations. Revans (1982) states that "the most precious asset of any organization is the one most readily overlooked -- its capacity to build on lived experience, to learn from challenges and to turn in a better performance by inviting all and sundry to work out for themselves what that performance might be" (p. 286).

Senge (1990) states that a learning organization must be able to integrate work with learning, that only through continuously reflecting on our activities can we become a learning organization. As Revans (1982) notes, action learning creates constant learning opportunities for people. It creates a culture and morale for learning.

Perhaps no tool is more effective in building a learning organization than action learning. Lex Dilworth (1995) has called action learning "the DNA of a learning organization" since action learning both enables and forces organizations to continuously learn on an organization-wide basis and thereby be better able to adapt to the continuously changing environment.

Keys (1994) remarks that "action learning is a truly unique organizational learning process that is growing in acceptance. Although originally designed as a managerial learning process, it offers excellent opportunities for promoting strategic organizational learning. Two significant events are occurring within action learning groups that help to create learning organizations:

1. Team members are resolving problems, the solutions to which are passed to clients and are themselves learning processes and relevant information valuable for future problem-solving episodes

2. The body of institutional knowledge and the pace of institutional learning is accelerating in user organizations

There are many elements of action learning that contribute to the building of a learning organization. Action learning:

- is outcome oriented
- is designed to systematically transfer knowledge throughout the organization
- enables people to learn by doing
- helps develop learning how to learn skills
- encourages continual learning
- creates a learning culture; learning becomes a way of life
- is an active rather than a passive approach
- is done mainly on the job rather than off the job
- allows for mistakes and experimentation
- develops skills of critical reflection and reframing
- is a mechanism for developing learning skills and behavior
- demonstrates the benefits of organizational learning
- models working and learning simultaneously
- is problem-focused rather than hierarchically bound
- provides network for sharing, supporting, giving feedback and challenging assumptions
- develops ability to generate information
- breaks down barriers between people and across traditional organizational boundaries
- helps an organization move from a culture of training (in which someone else determines and provides your development) to a culture of learning (everyone is responsible for their own continuous learning)
- is systems-based

Copyright © 1999 Michael Marquardt

- applies learnings to other parts of the organization as appropriate (Marquardt and Reynolds, 1994; Marquardt, 1997; Marquardt, 1998)

Four Subsystems of the Learning Organization

Each of these characteristics is part and parcel of the systems approach of viewing a learning organization. In this systems learning organization model, there are four subsystems (1) learning dynamics, (2) organization renewal, (3) people empowerment, and (4) knowledge management) that interface and support one another, all of which are strengthened via action learning (Marquardt, 1996)

Learning Subsystem

The learning subsystem refers to (a) levels of learning, (b) types of learning and (c) learning skills.

Levels of Learning

There are three levels of learning present in learning organizations:

Individual learning refers to the change of skills, insights, knowledge, attitudes and values acquired by a person through self-study, technology-based instruction, and observation.

Group or team learning alludes to the increase in knowledge, skills and competency that is accomplished by and within groups.

Organization learning represents the enhanced intellectual and productive capability gained through corporate-wide commitment and opportunity to continuous improvement. It differs from individual and group/team learning in two basic respects. First, organizational learning occurs through the shared insights, knowledge and mental models of members of the organization. Second, organizational learning builds on past knowledge and experience, on organizational memory that depends on institutional mechanisms (e.g., policies, strategies, and explicit models) used to retain knowledge.

Types of Learning

There are several types or ways of learning that are of significance and value to the learning organization. Although each type is distinctive, there is often overlap and complementarity of the various types. Therefore, a particular learning occurrence may be classified as being of more than one type.

Adaptive learning is learning from the experience and reflection.

Anticipatory learning is the process of acquiring knowledge from expecting the future (a vision-action-reflection approach) whereas **generative learning** is the learning that is created from reflection, analysis or creativity.

Single-loop, double loop and deutero learning are types of learning are differentiated by the degree of reflection placed on action that has occurred in the organization.

Skills of Organizational Learning

Four key skills are needed to initiate and maximize organizational learning, namely,

Systems thinking which represents a conceptual framework one uses to make full patterns clearer, and to help one see how to change them effectively

Mental models are the deeply ingrained assumptions that influence how we understand the world and how we take action. For example, our mental model or image of learning or work or patriotism impacts how we relate and act in situations where those concepts are operating.

Personal mastery indicates the high level of proficiency in a subject or skill area. It requires a commitment to lifelong learning so as to develop an expertise or special, enjoyed proficiency in whatever one does in the organization

Dialogue denotes the high-level of listening and communication between people. It requires the free and creative exploration of subtle issues, a deep listening to one another and suspending of one's own views. The discipline of dialogue involves learning how to recognize the patterns of interaction in teams that promote or undermine learning. For example, the patterns of defensiveness are often deeply ingrained in how a group of people or an organization operates. If unrecognized or avoided, they undermine learning. If recognized and surfaced creatively, they can actually accelerate learning. Dialogue is the critical medium for connecting, inventing and coordinating learning and action in the workplace.

How Action Learning Builds the Learning Subsystem

Action learning programs encourage and enable significant levels of learning to occur at the team and individual levels during the action learning sets. Perhaps, there is no greater demonstration of true team learning that what occurs during such set meetings where the entire group is developing common basic assumptions, common understanding of the problem and common growth in developing new knowledge. Usually, at the end of the action learning meeting, the set seeks to identify ways in which its learning can be applied to the organization and thereby create organization-wide learning.

All types of learning are sought and developed in action learning programs. In reflecting on past actions, the group attempts to adapt the new action to better respond to the environment. Anticipatory learning is acquired through the group's analysis of a variety of possible future scenarios or impacts of various actions. Almost continuously, action learning sets are generating innovative, new creative knowledge. Finally, the time and space provided for deep and frequent reflection during the action learning sets provides the avenue for single, double, and even deutero learning.

Action learning provides the opportunity for people in the organization to build each of these learning disciplines. In action learning sets we can reflect on our actions and the assumptions that underlie them. Action learning promotes "a depth and intensity of dialogue that is uncommon in the normal life experience." (Dilworth, 1998).

Revans (1982) notes that it is the "social dimension of action learning that provides the challenge to misconceptions and ingrained mental schemata which predispose a person to overlook the ways in which he/she needs to change." In action learning we can explore real problems in a non-defensive way with supportive colleagues who feel free to criticize, question and advise. Inherent in this approach is the ability to acknowledge that we frequently act in ways that may be incongruent with what we espouse.

Organization Subsystem

The second subsystem of a learning organization is the organization itself, the setting and body in which the learning itself occurs. The four key dimensions or components of this subsystem are vision, culture, strategy, and structure

Culture refers to the values, beliefs, practices, rituals and customs of an organization. It helps to shape behavior and to fashion perceptions. In a learning organization, the corporate culture is one in which learning is recognized as absolutely critical for business success, where learning has become a habit and an integrated part of all organizational functions. This rich adaptable culture creates integrated relationships and enhances learning by encouraging values such as teamwork, self-management, empowerment and sharing. It is the opposite of a closed, rigid, bureaucratic architecture. Risks are encouraged and past methods are to be challenged.

Vision captures a company's hopes, goals, and direction for the future. It is the image of the organization that is transmitted inside and outside the organization. In a learning organization it depicts and portrays the desired future picture of the company in which learning and learners create continuously new and improving products and services. A shared company vision is one that fosters genuine commitment and enrollment rather than compliance.

Strategy relates to the action plans, methodologies, tactics and steps that are employed to reach a company's vision and goals. In a learning organization, these are strategies that optimize the learning acquired, transferred and utilized in all company actions and operations.

Structure includes the departments, levels, and configurations of the company. A learning organization is a streamlined, flat, boundaryless structure that maximizes contact, information flow, local responsibility and collaboration within and outside the organization.

How Action Learning Builds the Organization Subsystem

The culture created in action learning programs is one where learning is the most important and valuable objective. Throughout the action learning process there is an emphasis on how the group can continue to expand upon and speed up their knowledge and learning capacities. Members are encouraged and expected to take risks and try new ways. They recognize that much of the greatest leaps in learning have come from learning from mistakes made.

Garratt (1991) remarks how action learning is particularly valuable in helping organizations develop a vision and culture committed to continuous learning. Schein (1993), a pioneer in understanding organizational culture and organizational change, notes that "for change (learning) to occur, the organization must unlearn previous beliefs, be open to new inputs and relearn new assumptions and behaviors." Action learning is a powerful tool in helping to change these values and create these new visions.

Action learning organizations have a bias for reflection-in-action. The capacity to quickly take action and to generate information is critical to organizations. Senge (1990) observes that "learning cannot exist apart from action. Action provides a basis for the critical dimension of reflection." It is the expressed strategy of an action learning program to build in time, space and opportunities for learning. And no strategy is more powerful for producing organization-wide learning than getting large numbers of employees involved in action learning programs.

The structure of an action learning set is very fluid and flexible. Keeping the flow of questions and knowledge as clear and complete as possible is critical in processes such as reframing the problem, identifying possible actions, and providing frank feedback to one another. Needless protocol and bureaucracy and administrivia are discouraged. Leadership flows easily throughout the group.

People Subsystem

The people subsystem of the learning organization includes employees, managers/leaders, customers, business partners (suppliers, vendors, and sub-contractors) and the community itself. Each of these groups is valuable to the learning organization, and all need to be empowered and enabled to learn.

Employees as learners are empowered and expected to learn, to plan for their future competencies, to take action and risks, and to take the initiative to solve problems. In learning organizations, they should be treated as mature, adult learners and be given authority and responsibility according to their learning capacities.

Managers/Leaders as learners carry out coaching, mentoring, and modeling roles with a primary responsibility of generating and enhancing learning opportunities for people around them. In addition to managing people, they should become proficient at managing knowledge. Revans (1980) once remarked, "encouraging autonomous learning is not managerial abdication." And finally, leaders should become champions of learning projects, including action learning programs

Customers can be a valuable source of information and ideas. They should thus be closely linked into the learning system and strategy of the organization. When possible, they should be offered training so as to become wiser customers and better able to advise relative to their future expectations from the company.

Partners, suppliers, and dealers as learners can receive and contribute to instructional programs. They can also benefit by sharing competencies and knowledge with the organization. Learning from and with suppliers, dealers, and partners should be a regular strategy of learning organizations.

Community groups as learners include social, educational and economic agencies that can share in the providing and receiving of learning. Involving the potential diversity of all these groups enhances product and service development.

How Action Learning Builds the People Subsystem

Action learning recognizes the importance of involving people from throughout the business chain in the problem-solving process. Action learning sets are most effective when customers, suppliers, and interested community members come together to ask fresh questions and share fresh perspectives.

Empowering people to take responsibility for themselves rather than waiting for outside expertise is a key value of action learning. Limerick et al. (1994) point out that there is within action learning programs "the explicit recognition that management's role is to provide continuous opportunities for employees' self-development."

Pedler (1991) notes that in learning organizations, a primary task of managers is to facilitate the staff's learning from experience. Through the experience of action learning, managers will recognize the importance of making time for seeking feedback, for obtaining data from a variety of perspectives, for encouraging new actions for old and new problems. They will also perceive the value in questioning their own ideas, basic assumptions, attitudes and actions.

Building learning alliances help organizations to achieve continuous improvement and develop the capacity to cope with discontinuous change. Learning from fresh faces is critical for success in action learning as it is in organizations. New partner and perspectives can:

- enlarge the range of the continuous environmental scanning ability of those in the alliance
- bring a wide analytical range, and a wider range of assumptions to the learning process, so that discontinuities are more likely to be recognized
- help member recognize and overcome defensive routines so that they can be more transcendent.
- take place at multiple levels within the alliance, and improve the learning of all members
- open up the boundaries of the organization, and make possible completely new organizational forms, constantly open to importing chaos and evolving new forms of order (Limerick et al., p. 36)

The origins of action learning can be traced to the creation of a learning alliance among colliery managers in Britain following nationalization of the British coal industry. Revans describes how he established a group of 22 managers, drawn from pits in England and Wales, to work together over 3 years on problems they identified as critical to their operations. Revans also developed alliances between medical professionals across a number of London hospitals and will as a learning community through a consortium of leading industrial organizations in Belgium

Knowledge Subsystem

The knowledge subsystem of a learning organization refers to the management of acquired and generated knowledge of the organization. It includes the acquisition, creation, storage, transfer and utilization of knowledge.

> **Acquisition** refers to the collection of existing data and information from within and outside the organization via benchmarking, conferences, environmental scans, Internet, use of consultants, publications, and research
>
> **Creation** involves new knowledge that is created within the organization through problem solving and insights as well as the conversion of tacit and explicit knowledge. Experimentation, demonstration projects, and reflecting on past and current programs increase the innovativeness of the company.
>
> **Storage** is the coding and preserving of the organization's valued knowledge for easy access by any staff member, at any time, and from anywhere. The knowledge should be categorized according to learning needs, work objective, user expertise, and function. It needs to be structured and stored so that it can be found and delivered quickly and accurately.
>
> **Transfer and utilization** includes the mechanical, electronic and interpersonal movement of information and knowledge, both intentionally and unintentionally, throughout the organization as well as its application and use by members of the organization.

The knowledge elements of organizational learning are ongoing and interactive instead of sequential and independent. The collection and distribution of information occurs through multiple channels, each having different time frames. An example is an on-line newsletter, which systematically gathers, organizes, and disseminates the collective knowledge of the organization's members.

Technology is needed to quickly and adequately implement all four stages of the knowledge management. Technology includes the supporting, integrated technological networks and information tools that allow access to and exchange of information and learning. It includes technical processes, systems, and structure for collaboration, coaching, coordination, and other knowledge skills. It encompasses electronic tools and advanced methods for learning, such as computer conferencing, simulation, and computer supported collaboration. All these tools work to create knowledge freeways. Good knowledge management is not possible with the use of technology.

How Action Learning Builds the Knowledge Subsystem

Acquiring Knowledge: Action learning organizations are information-rich. In action learning sets members recognize the importance of acquiring information not only from external resources but also the value of tapping the tacit, internal wisdom and experience of each other. The internal networks developed in action learning sets heighten the awareness of organizational resources, facilitate exchanging and sharing of ideas, and generates knowledge.

Creating Knowledge: Participants in action learning programs understand that they should seek new ways of solving old problems, that the old knowledge may no longer be sufficient. Thus, members are constantly creating new knowledge and to encourage innovation within the set. Nonaka (1994) suggests that information creation is a fundamental requirement for the self-renewing (i.e., learning) organization. An autonomous self-organizing group begins to be realized when members are given the freedom to combine thought and action at their own discretion and are thereby able to guarantee the unity of knowledge and action. The actions of action learning clarify and generate meanings.

Storing Knowledge: Knowing knowledge to store and why is based upon the organization's ability to make sense of the data encompassing and surrounding it. The company must then develop sense-making categories for coding and retaining value-added knowledge. Through its ongoing reflection on learning and the knowledge acquired, action learning programs lends themselves well to the Kantian school of thinking which "positions sense-making above mere sensing" (Botham and Vick, 1998). By reflecting on action, the set develops the ability to "make meaning" of the data collected and stored.

Transferring and Testing Knowledge: During the reflection periods, self-learnings become more explicit and intentional. Set members capture and store for themselves the knowledge and wisdom that will help them become better in both their professional and personal lives. Finally, action learning groups continuously seek ways in which they can transfer the learnings, wisdom, and experience gained in resolving the set's problem(s) to the organizations and communities in which they work.

Action Learning – The Cornerstone of a Learning Organization

Learning quickly and systematically is critical for surviving in the 21st century. The organization that makes learning its core business can rapidly leverage its new knowledge into new products, new marketing strategies, and new ways of doing business. Learning organizations will become the only place where global success is possible, where quality is more assured, and where energetic and talented people want to be. More and more organizations are seeing action learning as the vehicle to help them become learning organizations and to arrive safe and well into the next century.

Enhancing Individual and Organizational Learning: A Sociological Model

Andrea Casey
The George Washington University

A theoretical model of organizational learning is proposed to integrate and address the learning needs of individuals and organizations. This model, based on the sociological work of Talcott Parsons, definesorganizational learning as a dynamic process of knowledge creation. Implications for human resourcedevelopment in organizations are explored.

Keywords: Organizational Learning, Social Learning theory, Adult Learning

Individual learning in organizations is seen as a critical factor in an organization's capacity to change and survive over time (Nonaka, 1994; Senge, 1990). Major shifts in internal and external organizational environments impact learning at all levels. These shifts are frequent, diverse, sometimes unpredictable and, at other times, planned. For example, a large number of tenured administrators may leave a firm as a result of a merger and the organizations involved may lose valuable knowledge and expertise. Mergers or acquisitions also require all staff to learn and understand the mission, culture, policies, and products of the newly created organization.

Formal training and education are traditionally two of the organizational strategies of choice to attempt to adapt to environmental jolts. Human resource development (HRD) professionals in organizations have relied upon adult learning theories (Knowles, 1990) and training design (Nadler, 1982) to guide the development of learning activities for staff adapting to changing workplaces. Despite our current knowledge in HRD, learning outcomes are frequently uneven, unpredictable and often temporary. Although the influence of the workplace is acknowledged and incorporated in much of this literature and links are made to organizational learning (Marsick & Watkins, 1990), the focus has remained on individuals learning in organizations.

Organizational learning has also been proposed as critical to organizational survival particularly in times of rapid and revolutionary environmental changes. For over 40 years, theoretical models of organizational learning have been proposed and numerous typologies developed, yet it has only been in the past decade that empirical research has been conducted. Organizational learning has alternately been defined as adaptation and behavioral change or as a process of knowledge creation (Glynn, Milliken & Lant, 1994). The focus of many of these models has been on individual learning while others have focused only on organizational level learning yet rarely do either draw upon the work in adult learning.

This paper links the literature on organizational learning and adult learning and proposes a sociological model of organizational learning or knowledge creation for HRD professionals to use as a guide to meeting the learning needs of individuals and organizations. Maximizing all forms of learning or knowledge creation, whether individual or collective, formal or informal, may be the most effective strategy to assure individual and organizational effectiveness over time.

Theoretical Foundations and Definitions of Learning

Adult Learning

One of the basic assumptions of this paper is that both the process and outcomes of individual learning are inherently social. As early as 1926, Lindeman, one of the founders of the adult education movement, noted "we can progress not by giving attention to either organism or environment but to both and in relation to each other (p. 49). This interrelationship between the learner and the environment has been a continuing theme in adult education. Jarvis (1987) states that "learning is not just a psychological process but is intimately related to that world and affected by it...people take on the knowledge, values, beliefs, and attitudes of the society in which we live" (p. 11). This society may be the larger society in "which we live" as well as the society or culture of the organizations in which we work and spend most of our lives. The discussion of learning in this paper centers on learning in the workplace.

Not only are individuals and organizations part of interconnected learning systems, the knowledge and skills to be learned are social products (Chene, 1983). The new knowledge to be learned in a medical setting or manufacturing company may be created by university research centers or the professions in which people are

employed. How this knowledge is used on the job is frequently socially influenced by the work group in which someone lives.

This paper will draw on Marsick and Watkins' (1990) definition of learning as the way "in which individuals or groups acquire, interpret, reorganize, change or assimilate a related cluster of information, skills and feelings. It is also primary to the way in which people construct meaning in their personal and shared organizational lives" (p. 4). From this definition, Marsick and Watkins (1990) propose three types of learning that may take place in organizations.

Formal Learning

Traditionally individual learning in organizations is seen as an outcome of formal training and development programs in classrooms away from the actual work site. Formal training and education have been the mainstay of staff development in organizations.

Informal Learning

It is predicted that approximately 83% (Marsick & Watkins, 1990) to 90% (Sorohan, 1993) of the learning in organizations occurs through interaction in our day-to-day work through informal and incidental learning. There is a mixture of definitions of informal learning some equating it to unintentional learning while others relate it to autonomy (Garrick, 1998). This paper will use Marsick and Watkins' (1990) definition i.e. it is usually learning that "may include incidental learning and occur in institutions but is not typically classroom based or highly structured and control of the learning rests in the hands of the learner" (p. 12).

Incidental Learning

Marsick and Watkins (1990) define incidental learning as a "byproduct of some other activity such as task accomplishment, interpersonal interaction, sensing the organizational culture or trial and error experimentation" (p. 7). It can occur in organizations when individuals learn about the organizational culture by the way a needs assessment is conducted, or performance is assessed and rewarded. Frequently organizational members' learning is more powerfully shaped by the technical systems, policies, and processes in the organization than by more formal attempts to produce learning outcomes.

Despite the emphasis on individual or adult learning as a social process with social products or outcomes, the theoretical underpinnings of the work on adult learning are primarily focused on the individual and based in disciplines such as psychology and education. In organizations as well the emphasis remains on learning at the individual level with individual development plans as well as assessments of individuals' skills and abilities.

Organizational Learning

Similar to individual learning, definitions of organizational learning are numerous, multiple theoretical models have been proposed, typologies have been delineated (Shrivastava, 1983), and factors thought to influence the process of organizational learning have been identified and discussed (Huber 1991; Hedberg, 1981; Miner & Mezias, 1996). The construct of organizational learning emerged approximately 40 years ago with the work of Dearborn and Simon (1958). In several ways the organizational learning literature has paralleled the research and thought on individual learning beginning with more stimulus-response models and moving to information processing or knowledge creation perspectives. The two primary frameworks that emerge from the literature on organizational learning are behavior change (adaptation) and cognition (knowledge creation) (Glynn, Milliken, & Lant, 1994). Underlying the definitions of organizational learning in these frameworks are varying assumptions regarding learning.

The organizational learning theories of knowledge creation focus on the process of how knowledge is created, stored and transmitted while the adaptation theories evolve from the stimulus-response concepts of learning and describe how organizations change based on their experience (March & Olsen, 1976; Levitt & March, 1988; Fiol & Lyles, 1985). In most theories, knowledge creation is viewed as a social process (Duncan & Weiss, 1979; Schwandt, 1997) that is dependent on shared assumptions or frameworks for communication in organizations.

A similar and sometimes overlapping body of literature has developed under the general framework of knowledge creation in organizations. Many models of knowledge creation are based on theories of individual knowledge yet maintain that knowledge creation is a social process (Nonaka, 1994; Schwandt, 1997). Although knowledge is argued to be "...the property of individuals a great deal of knowledge is both produced and held collectively (Brown & Duguid, 1998, p. 90). Another commonality in the knowledge creation literature is the distinction between knowledge that is learned through experience and knowledge that is transmitted through other

means. This more tacit or procedural knowledge, the "know how" referred to by Brown and Duguid (1998) is usually learned through interaction with others (Kogut & Zander, 1996) in environments such as communities of practice (Brown & Duguid, 1998).

Summary

The definitions of learning discussed above focus on action as well as cognition. The implied outcomes of individual and organizational learning are change or to increase the adaptive capacity to survive through the creation of knowledge. The theoretical base for learning in organizations has been primarily individual learning theories. This paper proposes the sociological work of Talcott Parsons as a theoretical base for learning interventions in organizations. Using Talcott Parsons' (1951) general theory of action as a framework, individuals and organizations can be viewed as learning systems with similar required functions and learning needs arising to facilitate these functions. Marsick and Watkins' (1990) work is used to further expand this framework. In this paper, learning needs and strategies to fulfill them are discussed in the context of this model and its functions and subsystems.

Parsons' Theory of Action

Parsons theorized that the collective (organization) is an amalgamation of actors, objects, and norms and is characterized by social phenomena that are more than just the sum of individual behaviors and attitudes of the individual actors. It is characterized as interrelated systems of actions emerging from various levels of analysis i.e. individual, group and organization. Parsons' systems theory of action suggests that both performance and learning processes have the capacity to change or disrupt the equilibrium in the organization-situation relationship. However, change in a "social system" itself occurs through the learning process, not just the performance process (Schwandt, 1995).

The focus of Parsons' general theory of action is the establishment of a systematic relationship between the "actions" of the members of the social system (actors) and their collective ability to adapt to both inside and outside environments. Parsons describes four sets of actions as generic functional prerequisites of a system in response to critical issues associated with survival. Each subsystem of action carries out one of the four prerequisite functions necessary for the survival of the total system (Schwandt, 1997). The four functional prerequisites are:

> Adaptation is the complex of unit-acts which serves to establish relations between the system and its external environment…consists of taking diverse resources needed by the system for the environing systems, in exchange for products originating within the system itself" (Rocher, 1975, p. 41).
>
> Goal attainment is "all actions which serve to define the goals of the system to mobilize and manage resources and efforts to attain goals and gratification" (Rocher, 1975, p. 42)
>
> Integration is to "establish control, to inhibit deviant tendencies, to maintain coordination between parts, and to avoid too serious disturbances" (Rocher, 1975, p. 42)
>
> Latency or pattern maintenance is the "point of contact between systems of action and the symbolic and cultural universe. A system of actions which accumulates and distributes energy in the form of motivation" (Rocher, 1975, p. 42).

These functions can be generalized to all levels of analysis (individual, group, organization, society) as well as all types of systems such as biological and social. The prerequisite relationships allowed Parsons to describe the purpose of each action subsystem as it relates to the total system of action. These subsystems of action do not function independently. They interact and Parsons describes this relationship as a process of mutual exchange among the subsystems (Schwandt, 1997). He defines the elements of exchange as inputs and outputs or as media of interchange.

A Sociological Model of Organizational Learning

Grounded in Parsonian theory, the organizational learning model developed in this paper focuses on the learning of an organization as a social system. It provides a way of viewing organizational behavior that can explain how people collectively engage in the dynamic social actions associated with learning. It is focused on the system's ability to adapt to its environment not just through a performance orientation but rather through actions (learning) that influence the collective cultural values. In this paper, organizational learning is defined as "a system of actions, actors, symbols and processes that enables an organization to transform information into valued knowledge which in turn increases its long-run adaptive capacity" (Schwandt, 1997, p. 343).

Parallel to the general system of action, the organizational learning system carries out four functional prerequisites so that learning capacity is maintained for the collective. It is postulated that these prerequisite functions are carried out by four learning subsystems. These subsystems and their prerequisite functions are: environmental interface (adaptation) which serves as the information portal for the organizational learning system; the action-reflection subsystem (goal attainment) which consists of the activities the collective uses to accomplish goals of the organizational learning system; structuring subsystem (integration) which is characterized by its ability to match information and knowledge transfer actions with the requirements of other subsystems including integrative acts such as networking, and creating policies; and finally the meaning-memory subsystem (pattern maintenance) that provides the collective meaning and memories. Dysfunction in one learning subsystem will jeopardize the effectiveness of the whole system since each learning subsystem is dependent upon inputs from other subsystems. These interdependent relations are maintained through interchange mechanisms called "interchange media."

Although the use of Parsons' work may invite controversy, no other American sociologist is so widely used in the development of organizational theory (Schein, 1991; Quinn, 1990; Dennison, 1990; Schwandt, 1997). Parsons' theory of action does not constrain us to static predictable interpretations of social systems. Instead the prerequisite functional patterns of actions provide a better understanding of the dynamic social nature of collective learning. Parsons' general theory of action provides "a cross disciplinary (sociology, psychology, biology, and anthropology) synthesis as opposed to a sterile and fragmented model" (Schwandt, 1997, p. 344) from traditional disciplines (Burrell, Reed, Calas, Smircich, & Alvesson, 1994). Empirical research (Casey, 1997; Gray, 1995; Gundlach, 1994) as well as field studies on this model are currently underway.

This paper proposes this sociological model of organizational learning as a guide to developing learning interventions in organizations. Using Talcott Parsons' work, individuals and organizations can be viewed as learning systems with similar required functions and learning needs that arise to facilitate these functions. In the following section, these learning needs and strategies to fulfill them are discussed in the context of this model and its functions and subsystems.

Meeting the Learning Needs of Individuals and Organizations through Multiple Forms of Learning

This section will discuss how organizational and individual learning needs that arise to meet the functional requirements of the learning system may be met. To facilitate discussion and exploration of this model, an example of an integrated strategic planning process following the merger of two companies will be discussed. Strategic planning is common to all organizations as they adapt to changes in the environment and is frequently undertaken following the merger of two companies. In many organizations, strategic plans are developed exclusively by a executive team in a retreat setting. Yet including staff in the planning process can address the required functions of the learning systems and related learning needs through formal, informal, and incidental learning.

Adaptation (Environmental Interface Subsystem)

Organizations and individuals respond continuously to multiple external environments as they adapt and survive. The strategic planning process is an organizational response to changes or potential changes in a market. It can also be a process for gathering information about the external and internal environments to meet the adaptation needs of the organizational learning system particularly if staff are involved in the planning process. Staff involvement in the process can bring their knowledge and an awareness of their needs to the process. In addition, staff through formal and informal learning in sessions develop a greater understanding of the organization's potential and restrictions. Incidental learning may result in tacit knowledge that includes understanding the value the organization places on the input of staff and their concerns.

Through involvement in strategic planning, individual learning needs of staff are met by helping them adapt to the new organization. Individual learning needs may include a desire for more information about the future of the new organization, the consumers it will serve and the product changes to be expected. Involvement in the strategic planning process meets some of these learning needs though the formal, informal, and incidental learning that occurs during the planning. Explicit knowledge may be transmitted formally about the new administration, and consumers interests and demands. Informal settings such as "breaks" or hallway discussions may provide information about new staff in the organization and their roles through incidental learning. Incidental learning about strategic planning processes or group dynamics may happen through involvement in small work groups during the process.

Goal Attainment (Action Reflection Subsystem)

Many learning needs may arise as organizations create and act upon goals and objectives. At the organizational level, following a merger, the organizational mission may change and the goals and related objectives need to be created through strategic planning. The strategic planning process offers time for collective action and reflection regarding directions and goals.

A corresponding individual learning need might be to better understand the changes in the mission and goals of the organization and how these changes will affect roles in a department. This knowledge may be obtained through formal learning in sessions. Action and reflection of individuals in small groups in the planning process may facilitate an individual's understanding of the relationship of these goals to his/her work.

Integration (Structuring Subsystem)

Many strategies are designed to integrate organizations. Dissemination, the more formal procedure for achieving this integration, is frequently accomplished through formal communication procedures in a firm. An organizational learning need that occurs in a newly created organization is how to establish the most effective mechanisms for this formal communication. A corresponding individual learning need of staff in this organization may be to understand new communication channels in the firm.

Diffusion, the informal means for integration, relies upon informal networks that exist among staff. An organizational learning need may arise in a newly created organization related to the establishment of teams within or across units to facilitate these informal networks. Individual learning needs may include a manager's desire to understand how to encourage team work as these units are formed or how to identify and access a "grapevine."

The strategic planning process, while meeting the needs of the performance system of an organization, can also meet organizational learning needs such as the need to integrate staff formerly from two organizations into one newly created firm. The planning process can facilitate meeting this need by involving all staff in the planning process in cross-functional small work groups. Formal learning transmitting explicit knowledge about new roles and expectations may occur during the planning process. Informal learning in hallways may occur as individuals discuss their new roles in the organization. Incidental learning may involve tacit knowledge of group facilitation or an understanding of the philosophy of the new management.

Pattern Maintenance (Meaning/Memory Subsystem)

Meaning and memory in organizations provide the foundation for guidance and control. This subsystem plays an essential role in the culture or pattern maintenance of an organization. At the organizational level, a continuous learning need exists to create and transmit the mission, values and beliefs of the organization. For the individual, a learning need is to know and understand these beliefs and values i.e. "how things are done around here." In the strategic planning process, tacit knowledge of the organizational culture may be gained through incidental learning that occurs in small and large groups during the planning process. Explicit knowledge may be created as the results of the process are formally disseminated to staff and consumers. By designing a process that involves staff in the development of the mission and goals, meaning and memory are engaged as people share the meaning of the goals and objectives through discussion of past goals, the histories of the organizations, etc.

Linking Individual and Organizational Learning Needs

Integrating individual and organizational learning is difficult to accomplish. This has stemmed in part from relying on individual level learning theories or upon organizational theories alone. This paper proposes an integration of

these theories through a sociological framework of organizational learning. Enhancing multiple forms of learning through this framework can meet individual as well as organizational learning needs in addition to facilitating the required functions of a learning system. To achieve this integration, the responsibility for learning in organizations will need to be broadened from the HRD function to all staff in the organization.

At the individual level, staff would be encouraged to be responsible for their own learning. In addition, as is currently the case in many organizations, managers would be charged with fostering the development of staff. Using the organizational model proposed in this paper as a guide, learning plans can be developed keeping in mind all forms of learning and the required functions of a learning system. As learning plans are developed, basic questions related to the required functions of systems could be asked. Examples of questions are given in Table 1 below.

Table 1

Diagnosing Leaning Needs
Organizational Action: Strategic Planning in Response to a Merger

	Basic Questions to be Asked	Individual (Example of Identified Learning Need)	Organization (Examples of Identified Learning Need)
Adaptation (Environmental Interface)	How can the individual/ organization obtain environmental information?	Understand needs for products and services	Obtain staff input on needed products and services.
Goal Attainment (Action/Reflection)	How can the individual/ organization establish and meet goals?	Translate organzational goals into personal goals.	Act and reflect to determine goals.
Integration (Structuring)	How can the individual/ organization be integrated both internally and with other systems?	Understand his/her role in relationship to other roles and structure of the organization.	Communicate information about the strategic planning process and the goals and objectives of the organization.
Pattern Maintenance (Meaning/Memory)	How can the individual/ organization create meaning in the work of the organization?	Understand the values and beliefs of the organization.	Transmit the values and beliefs of the organization through the strategic planning process.

At the group or team level, managers could conduct a learning assessment that reflects the group as a system. For instance, a department could assess if the culture of the group fosters informal learning among members? Are group members free to question procedures and assumptions? Are they aware of how the group or team fits with the rest of the organization? Do they as a group take time to plan and set goals based on the overall mission of the organization? How as a group do they interpret the mission of the organization?

At the organizational level, a key role of managers including HRD professionals will be to develop and maintain a culture which supports individual and organizational learning. Marsick and Watkins (1900) note actions that support continuous learning in organizations including "reflecting on practice, full and free dialogue, public experimentation and inquiry, continuous informal learning of the job fostered by networks." Dixon (1997) uses hallway conversations as a metaphor to stress the importance of informal learning in organizations and the need for an organizational culture that supports questioning of assumptions and learning in all environments.

Additionally, managers will need to focus on organizational actions and the potential consequences of these actions on learning systems at all levels. The model presented in this paper can serve as a framework for a series of questions that can guide managers as they create or respond to organizational actions by analyzing whether actions proposed facilitate the prerequisite functions of not only the performance system but the organizational learning system as well. To facilitate this learning managers need to develop a wide spectrum of skills from the more traditional knowledge of adult learning and program design to organizational diagnosis skills.

Based on this model, evaluation of learning in organizations would need to be expanded as well. Traditionally a training program based on skills development might assess if the skills were learned or possibly attempt to link the program to organizational performance. Translated to the model presented in this paper, most of the evaluation of training is focused on goal attainment function of systems. Evaluation of learning will need to be reframed to measure variables connected with other subsystems as well. For example, did an organizational event such as a strategic planning process contribute to the overall integration of the agency? Did the process develop meaningful goals for the agency and staff? Were these goals disseminated to each agency staff person? What was the incidental learning resulting from the process? Were the goals and the way they were developed and disseminated congruent with the culture of the organization? Are they meaningful to staff?

Summary

The process and interaction of individual and organizational learning are complex. Although considerable research has been conducted on adult learning, research is just beginning on organizational learning and knowledge creation and in the exploration of various methods of learning in the workplace. The connections between these literatures need to be strengthened to build upon the wealth of knowledge being created. The model presented in this paper explores some of the possible links between individual and organizational learning and provides a framework to question the impact of organizational actions on learning systems in organizations.

Predictors of Learning Organizations: A Human Resource Development Practitioners Perspective

Orlando V. Griego
Gary D. Geroy
Colorado State University

This study sought to find predictors of learning organizations as determined by Marquardt's (1996) Learning Organization Profile. For this study, 48 professionals comprised of male, female, civilian, and military were asked to rate their perceptions about their organizations. Moreover, they were asked to rate their organizational perceptions on rewards and recognition, training and education, information flow, vision and strategy, and individual team development. The study found two predictors or learning organizations.

Keywords: Learning Organization, Rewards and Recognition, Training and Education

The learning organization is an appealing concept that reflects the aspirations of leaders today—an organization that constantly improves results based on increased performance made possible because it is growing more adroit. The purpose of our discussion is to report on an empirical study which looked at predictive practices that would enable organizations to achieve learning organization success. The outcomes of the empirical study will be put in the context of the current literature on learning organizations, and summarize practice-based variables that are applicable to developing learning organization characteristics. Finally, we will consider the research results and implications for human resource development practitioners and scholars.

Research Questions for Study

The purpose of this research was to determine predictors of learning organizations. Research questions this study addressed were:

1. Were training and education a predictor of learning organizations.
2. Were rewards and recognition a predictor of learning organizations.
3. Were vision and strategy a predictor of learning organizations.
4. Was information flow a predictor of learning organizations.
5. Was individual and team development a predictor of learning organizations.
6. Was gender a predictor of learning organizations?
7. Were military or civilian populations predictors of learning organizations?

Theoretical Framework

Learning Organizations

Since Senge's (1990) work on the "Fifth Discipline", discussions on the concept of learning organizations has grown exponentially. Crossan and Guatto's (1996) study found remarkable publication growth in the literature on learning organizations. From the 1980s to the 1990s, they discovered a 636 percent growth in general publications. It is obvious the literature and interest continues to grow. Roth and Kleiner (1995) have stated that over 150 books and articles were published about learning in organizations, or about the concept of a "learning organization" since they published their work.

It is essential to understand the practices and principles that make up a learning organization. Marsick and Watkins (1994) contend that "the learning organization is not a prescription, but rather a template for the examination of current practices. . ." (p. 354). Senge (1990), as well as other authors, have studied the characteristics obligatory for organizations to achieve learning organization levels of success (Kline & Sanders, 1993; Marquardt, 1996; Watkins & Marsick, 1993). Though important, it is also essential to provide relevant predictor data that provides for the applicability of learning organizations. However, there appears to be an empirical research void on the topic of learning organizations. The vast majority of the literature on learning organizations is

Copyright ©1999 Orlando V. Griego

theoretical in nature. Consequently, this study focused on current practices which predictably lead to learning organizations. Specifically, this research was intended to determine practices, or rather the "what" that leads to learning organization success.

Organizations by their very nature learn. However, some researchers like Daniels (1994) have contended that there is no shared meaning of what constitutes a learning organization. Others such as Calvert, Mobley, and Marshal (1994) contend there are no "true" learning organizations, but only organizations which exhibit certain attributes we might expect a learning organization to demonstrate. Yet others such as Morris (1993) as well as Pedler, Burgoyne, and Boydell (1990), provide a concrete definition of a learning organization as one that facilitates the learning of all its members and continuously transforms itself. Marquardt (1996) expands on this by referring to learning organizations as an "organization which learns powerfully and collectively and is continually transforming itself to better collect, manage, and use knowledge for corporate success" (p. 19). Senge (1990) refers to learning organizations as organizations where people continually expand their capacity to create the results they truly desire, where new expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning how to learn together All these definitions suggest an important relationship between practices in the workplace and learning organizations.

It is important to note there is a difference between learning organizations and organizational learning. As Marquardt (1996) notes, learning organizations focus on the "what"—the characteristics, principles, and systems of an organization that produces and learns collectively. Learning organization, on the other hand, refer to the "how"—the proficiencies and processes of knowledge development. Scholars have argued that learning organizations lead to turn-around success stories in major corporations (see Garvin, 1993; Marquardt, 1995). Moreover, researchers contend that such establishments developing learning organization practices result in increased organizational performance (Kline & Saunders, 1993; Kuchinke, 1995; Slater & Narver, 1995). Whatever the argument, researchers agree that learning organizations are consequential to success.

Practitioner's Approach to Learning Organizations

Complaints often arise about the lack of relevance in the research emphasis of contemporary academics (see Fulmer, 1995). Scholars are often seen as ivory tower thinkers who have lost the practical side of research. This study is intended to move between theory in academic institutions and the practitioner-based world of human resource development. Studies have shown organization development practitioners are motivated to the field by a desire to have positive effects on people and the organization, desire to institute change, enhance organization effectiveness, exercise influence and power, and seek growth and learning (Van Eynde, Church, Hurley, & Burke, 1992).

Research regarding practitioners' activity patterns showed seven activity categories emerged: human resources planning and development, management style development, vision facilitation, job and structural design, high-technology integration, managing diversity, and planning and forecasting (Fagenson & Burke, 1990). Connor and Ulrich's (1996) work is emphasizing a new direction for HRD practitioners. They believe strategic HR functions such as developing teamwork, identifying training skills and competencies, envisioning and strategizing a customer service mindset, and global expansion are occupying the attention of human resource practitioners world-wide. Given the research on practitioners, this study categorized five HRD domains based on learning organization research. They include training and education, rewards and recognition, information flow, vision and strategy, and individual team development.

Training and Education

Training and education are key aspects of the learning organization. As Gephart, Marsick, Van Buren, and Spiro (1996) note, training is a tool for learning; learning as a desired outcome influences performance improvement. Some scholars believe the goal of training and education in learning organizations is to reach the level of learning facilitation (Cusimano, 1996). Nadler and Nadler (1994) have noted that training leads to learning and learning leads to improved job performance. Moreover, they go on to state there are three domains of learning—skills, knowledge, and attitude. These three domains, Nadler and Nadler believe, are the result of training and education which ultimately lead to enhanced performance. McManus (1995) echoes this approach as well. He states knowledge, skills, and aptitudes are essential for organizational success and learning, and avoiding extinction, in the twenty-first century. Iles (1994) and Robinson, Clemson, and Keating (1997) join the argument by emphasizing that knowledge and skills must be developed in order for organizations to learn.

Rewards and Recognition

There is a plethora of research on this topic. In studies dating as far back to the 1940s, employees have indicated appreciation for work done and a feeling of being in on things are important to their performance (see Nelson, 1996). Nelson's treatise is that recognition boosts employees' esteem and performance and that compensation is a right, whereas recognition is a gift. Bennett and O'Brien (1994) insist rewards and recognition are essential aspects of building a learning organization. As Bennett and O'Brien say, "Reward-and-recognition systems must support and encourage individual and organizational learning. This can take many forms, from honoring individual employees who take risks to offering a profit-sharing plan that benefits everyone when the organization learns and grows" (p. 47). Lippitt (1997) contends that learning within organizations is the result of four building blocks—education, training, mastery, and recognition. Beyond the previous discussion of these first two, Lippitt believes human resource professions must create reward systems to encourage exploration, innovation, and the development of learning. Wilkinson and Kleiner (1993) concur by suggesting there are extensive benefits for both the individual and organization by recognition of learning skills including a greater sense of ownership in the organization. Wilkinson and Kleiner contend that benefits to be derived include reduced turnover and absenteeism, greater employee interest and involvement, and increased focus on organizational values and goal.

Information Flow

Camerer and Johnson (1991) refer to information as descriptive and knowledge as predictive. That is, information relates to the past and the present while knowledge provides a basis for prediction of the future based on information about the past and present. As such, learning is advanced when information flows within the organization. This flow of information is critical to organizational learning and success. Kock, McQueen, and James' (1997) study suggested optimized information flow has impacts on productivity, quality, and learning within organizations which, in turn, leads to organizational competitiveness.

Iles (1994) strongly asserts that information and knowledge must be shared across the organization if working practices are to be improved and risk-taking is to be encouraged. To do this, Iles believes the culture of the organization as a whole needs to be more openly supportive of learning. Tobin (1998) goes as far as to warn that organizations that inhibit information sharing develop into negative learning environments characterized by rigid organizational structures, policies, and procedures that force people to work in the same manner. As example, Davis' (1997) qualitative study on learning organizations found that employees were critical of managers that played games with information and were unwilling to share information. In this environment, the result is potential organizational failure.

Vision and Strategy

Both Senge (1990) and Pedler et al. (1991) make the case for development of a vision in learning organizations. A vision provides members of an organization a direction by which they can navigate. There are few if any examples of great companies who have achieved success without incorporating a vision. As Marquardt (1996) states "when there is a truly shared, genuine vision, people tend to excel and learn" (p. 46).

Robinson, Clemson, and Keating (1997) suggest that the role of learning in the organization follow two premises—there must be a shared vision and the existence of the learning system required to achieve the vision. The shared vision indicates the shared goal the future, set the direction for the organization and implies the particular type of learning system needed. The learning system provides the means. Bennett and O'Brien (1994) assert organizations and their constituents should envision their future so that they can determine the learning required to get there. Vision, Garavan (1997) indicates, is the catalyst that enables a learning organization culture to be created. Such a culture of learning takes an organization from invention to innovation. Campbell and Cairns (1997) work on developing and measuring learning organizations indicates some of the predictors listed in this study including vision and strategy, rewards and recognition, and information. As regards vision and strategy, they contend both are necessary towards measuring the success of learning organizations and developing a long term commitment.

Individual and Team Development

According to Bennett and O'Brien (1994), learning organizations should seek ways to motivate their employees to develop individually and promote the growth of teamwork. Teams, and individuals within teams, provide the means for organizations to learn effectively by continuously reinvent their work. Both teamwork and individual empowerment are required of organizations that pursue a learning organization strategy.

Senge (1990) argues team building is a vital component of building a learning organization. Much as individual empowerment is essential to success, similarly, teamwork and team empowerment is fundamental towards developing the learning capacity of an organization. Team learning starts with dialogue which is free flowing, allows members to develop new and creative ideas, and ultimately to see beyond themselves and focus on the organizational perspective (Appelbaum & Goransson, 1997). Gardiner and Whiting's (1997) empirical study on success factors in learning organizations support this notion with their results that indicated organizations were more like learning companies when they were empowered as teams and individuals.

Methodology

The independent variables, training and education, rewards and recognition, information flow, vision and strategy, and individual team development were assessed using the Learning Organization Practices Profile (O'Brien, 1994). The instrument has 12 subsystems of which 5 were used for this study. Each subsystem consists of five questions that range from 5 = strongly agree to 1 = strongly disagree. The five areas and a sample of their questions were as follows:

Vision and Strategy:

1. We have a vision of ourselves as an organization in which learning and purposeful change are expected.
2. The vision and strategy are continually updated, based on changes in the business environment and customers' needs.

Information Flow:

1. We communicate key business information to all employees through channels such as organization newsletters, department meetings, and/or all-personnel meetings.
2. We utilize advanced technology to improve the flow of information and to enhance our communications with one another (for example satellite TV, computer networks, electronic mail, cellular phones,, or pagers).

Individual and Team Development:

1. Work teams and long-term project teams have specific learning agendas.
2. Taking responsibility for our own learning and devleopment is considered part of our jobs.

Training and Education:

1. Educational programs include skill training on becoming more creative problem solvers.
2. Formal training programs provide us with tools, job aids, or processes that enhance on-the-job performance.

Rewards and Recognition:

1. We are recognized for solving business problems or successfully meeting challneges.
2. We share directly in the profits of the business through a profit-based reward system.

The dependent variable was assessed using Marquardt's (1996) Learning Organization Profile listed in his text "Building the Learning Organization." The profile has five subsystems. They include Learning Dynamics: Individual, Group/Team, and Organizational; Organization Transformation: Vision, Culture, Strategy, and Structure; People Empowerment: Employee, Manager, Customer, Alliances, Partners, and Community; Knowledge Management: Acquisition, Creation, Storage/Retrieval, and Transfer/Utilization; and Technology Application: Information Systems, Technology-Based Learning, and Electronic Performance Support Systems. There are a total of 50 questions in the profile where participants respond from 4 = applies totally to 1 = applies to little or no extent.

For this study, 48 working professionals in a Human Resource Development Master's Degree program volunteered to take both instruments. Of the 48, 27 were female, 21 were male, 16 were military, and 32 were civilian. Fifty questionnaires were handed out and 48 were returned for a 96 percent return rate.

Results and Conclusions

The Learning Organization Profile (Marquardt, 1996) and subsystems of the Learning Organization Practices Profile (O'Brien, 1994) were administered to 48 working professions with diverse occupations. Military personnel were either active duty military or Army National Guard Reserve members. Approximately half were officer and active duty while the rest held positions in a wide variety of occupations—teacher, administrator, manager, and so forth. Civilian personnel also held a wide variety of positions including human resource specialist, training manager, hospital administrator, educator, civil service manager, flight controller, and so forth.

Statistical analysis was completed using Statistical Package for the Social Sciences (SPSS). Descriptive statistics, Chronbach's alpha, one-way ANOVA, and multiple linear regression were utilized. The majority of participants were female (56 percent) and civilian (67 percent). Internal consistency reliability for this study was determined using Chronbach's alpha. This technique is versatile because it can be used with instruments made up of items that can be scored with three or more possible values. Overall, the five predictor variables reliability measured in the high .80s and low .90s with only one moderate alpha below .80 (range = .78 to .92) while the Learning Organization Profile (dependent variable) had a very high reliability measure of .97.

As noted in Table 1 and Table 2, this study determined there were two significant predictors of learning organizations when all five predictor variables were entered simultaneously using multiple linear regression. Rewards and recognition ($p = .003$) as well as training and education ($p = .045$) were predicted significantly and positively from the Learning Organization Profile. In other words, those participants who answered positively that they received rewards and recognition on the job and belong to an organization that emphasized training and education were most like to assess their work environment as a learning organization. These two areas accounted for 63 percent of the variance (see Table 3).

Gender as well as military versus civilian status was also explored as predictors of learning organizations. However, the data suggested there were no significant differences or predictors between men and women or military and civilian employees.

Table 1

How This Research Contributes to New Knowledge in HRD

Few empirical studies have been published on the subject of the learning organization. The majority of the research is theoretical in nature. This study focused on empirical research to attempt to determine practical approaches to developing learning organizations. The study determined two predictors out of five subsystems—rewards and recognition and training and education. Individuals within organizations who felt their work was appreciated, rewarded for taking chances, not punished for mistakes, and had a rewarding management system were overwhelming likely to define their workplace as a learning organization. To a lesser but still significant extent, training and education were predictive of learning organizations. That is, those individuals who felt their work environment was supportive of practices that included skill training, problem solving education, diagnostic tool support, encouragment to learn new skill and knowledge, and formal training programs tended to see their organization in the context of learning organizations. This is important to both scholars and practitioners for several reasons.

Human resource development professionals know learning organizations increased productivity and performance. Researchers have extolled the benefits of learning organizations--they lead to turn-around organizational achievement (see Garvin, 1993; Marquardt, 1995). Furthermore, researchers contend that such establishments developing learning organization practices result in increased organizational performance (Kline & Saunders, 1993; Kuchinke, 1995; Slater & Narver, 1995). There is little dissention that learning organizations are believed to be important to bottom line success.

The results of this study lend empirical evidence to theoretical logic. First, that appropriate rewards and recognition are an undergirding structure to the learning organization. When present, the findings suggested organization members viewed their enterprise as a learning organization. Second, that an environment of knowledge sharing and learning systems was an indication of learning organization.

Cahill (1997) has lauded the environment where mistakes are rewarded, accepted, and encouraged. This experience is what he refers to as a learning organization environment where rewards and recognition flow freely. The majority of questions in the Learning Organization Practices Profile (O'Brien, 1994) regarding rewards and recognition were intrinsic rewards. This is significant for two reasons. First, the cost of intrinsic rewards (appreciation, thank-you, pat on the back) is minimal yet we find the return on investment is statistically significant (accounting for 63 percent of the variance with training and education). Second, scholars such as Tobin (1998) and Bennett and O'Brien (1994) insist rewards and recognition are essential aspects of building a learning organization. Such a learning organization lead to employees who create a positive learning environment that encourages organization-wide learning and productivity—a recipe for success.

Training and education have important ramifications for HRD professionals seeking to develop learning organizations. It can be a valuable tool in workforce education. Wick and Leon (1993) note the advantages of training include subject matter in a timely fashion, baseline knowledge, introduction to new paradigms, and development of interpersonal skills. Applelbaum and Goransson (1997) see training as an inadequate but first step on the road to learning organization development.

The findings from this study support the notion that interventions intended to aid in the metamorphous from a current organization state to that of a learning organization, may wish to focus initially on two aspects. These aspects are the systems and indicators related to rewards and recognition, and training and education. The data recognizes reward and recognition as very significant. Especially of interest is the value of intrinsic reward. Posed within a cost benefit context, this reward emphasis and shift is inexpensive to achieve, quick to implement through moderately intense O.D. interventions, and is efficient in terms of time. As such, the return on investment (ROI) is great relative to tangible cost.

The other predictor of the learning organization resulting from the study was found to be training and education. Although this dimension of learning organization development and maintenance has more tangible costs, the outcomes in terms of positive benefit are easily observed. Work by Geroy and Swanson (1987, 1986, 1984) has

shown not only predictive positive ROI potential, but summative bottom line improvement can be realized through strategic training investment. Beyond the ROI imperative, the investment in training and education supports the new paradigms of succession planning which emphasize pool candidacy preparation rather than replacement planning. In this model, individuals use the training and education opportunities to prepare for pools of qualified individuals who will be needed to situationally support and be valued in vertical, lateral, and downward mobility strategies to meet enterprise needs.

Based on the data from this study, it is our contention that HRD and HRM professionals should emphasize behaviors and strategic change, which focus on these two significant predictors of learning organizations. We suggest that the result will be maximization of the momentum toward the designed organization changes and performance which have been attributed though theoretical studies to the learning organization dynamic.

Action Learning and Systems-level Continuous Learning

Judith A. O'Neil
Partners for the Learning Organization, Inc.

Systems-level continuous, or organizational, learning, is an important element in building learning organizations. The results of an evaluation of an ongoing 2 year action learningprogram in a major Northeast utility company demonstrate that action learning can help to create the capacity for systems-level continuous learning.

Keywords: Action Learning, Systems-Level Continuous Learning, Organizational Learning

Much has been written in this decade about the need for organizations to develop the capacity for learning, in order to create and manage knowledge that can be used for organizational success—in other words become a learning organization (Marquardt, 1996; Marsick & Watkins, forthcoming; Redding & Catalanello, 1994; Senge, 1990; Watkins & Marsick, 1993;). One of the key components, and one of the more difficult endeavors in becoming a learning organization, is the development of systems-level continuous, or organizational, learning (Argyris & Schon, 1978; Marquardt, 1996; Marsick & Watkins, forthcoming; Redding & Catalanello, 1994).

A number of authors hold that action technologies (Brooks & Watkins, 1994)—particularly action learning—can be used to develop systems-level continuous learning (Dilworth, 1998; Marquardt, 1996; Marsick & Watkins, forthcoming; Watkins & Marsick, 1993). While there are stories of how action learning, and other methodologies, have been used to help build learning organizations, many tell the story of a short term intervention, interventions involving few people, or from the perspective of anecdotal data (Chawla & Renesch, 1995; Watkins & Marsick, 1996).

This paper looks at the question—Can action learning help to develop systems-level continuous learning within an organization? To help answer this question, the paper reports on the results of an organizational evaluation of an action learning program, involving over 250 people, ongoing in the Distribution department of Public Service Electric & Gas (PSE&G) in New Jersey for over 2 years. This evaluation demonstrates an impact on systems-level continuous learning in the organization.

Systems-level Continuous Learning/Organizational Learning

Many authors look at systems-level continuous, or organizational, learning as having two components (Argyris & Schon, 1978; Marquardt, 1996; Marsick & Watkins, forthcoming). The first component is described by Argyris and Schon as occurring when "members of the organization act as learning agents for the organization" (1978, p. 29) and by Marquardt as "through the shared insights, knowledge, and mental models of members" (1996, p. 37). Marsick and Watkins who adopt the approach of Argyris and Schon say that "people are appointed or otherwise anointed by followers, to act on behalf of a system. When these individuals learn, they can take their learning back to the system" (forthcoming).

The second component deals with ways in which this individual learning becomes a part of the organization. The process can be thought of in terms of "restructuring organizational theories of action" (Argyris & Schon, 1978, p. 29); building on past organizational memory and the sharing of knowledge, beliefs and assumptions (Marquardt, 1996); or having "structures, systems, and a culture in place to embed and support organizational learning in order to make it permanent and routine so that learning endures even if the people do not" (Marsick & Watkins, forthcoming).

The action learning program at PSE&G was designed with an evaluation process to look at both of these components. Ongoing evaluation looked at individual and team learning and how that learning was carried into the workplace. The topic of this paper, the organizational evaluation, looked at whether or not that learning had spread elsewhere in the organization.

Action Learning

The concept of action learning originated with the work of Reg Revans in England in the 1940s (1989). It can be generally defined as follows:

> Action learning is an approach to working with, and developing people, which uses work on a real project or problem as the way to learn. Participants work in small groups to take action to solve their project or problem, and learn how to learn from that action. A learning advisor (or coach) works with the group in order to help them learn how to balance their work, with the learning from that work (O'Neil, forthcoming).

"One of the problems of describing action learning is that it means different things to different people" (Weinstein, 1995, p. 32). As a result, discussions and explanations of action learning programs can appear to be describing different, and sometimes contradictory, events. One way of thinking about differences in action learning is through the underlying basis by which practitioners view that learning takes place during action learning. O'Neil (forthcoming) has identified 4 "theoretical schools" of action learning that help to clarify some of these differences.

School	Scientific	Experiential	Critical Reflection	Tacit
Theory	Learning from problem solving - Alpha, Beta, Gama	Learning from experience	Learning through critical reflection	Incidental learning
Practitioner	Revans (1989)	McGill & Beaty(1995) Mumford (1996)	Marsick (1990) Pedler (1996)	Noel & Charan (1992)

Practitioners who espouse the Scientific school believe that action learning participants learn through solving their problem using methods based in the scientific method. Revans categorizes his theory of Systems Alpha, Beta and Gamma as a scientific based method for achieving managerial objectives (1982). Proponents of the Experiential school see Kolb's learning cycle (1984) as the basis by which individuals learn. In the Critical Reflection school, practitioners believe participants need to go beyond problem solving to problem posing, and reflection on the basic premises that underlie their thinking. Mezirow (1991) refers to this kind of reflection as "critical reflection". Marsick and Watkins refer to incidental learning as "never planned or intentional ... always tacit" (1992, pp. 7&8). The main differences between the Tacit school, and the other three, are its strong focus on the project and its lack of intentionality and planning for learning.

These "schools" do not officially exist, and are not intended to label practitioners in any way, but are intended to clarify differences in the literature and practice. Based on his/her view of how learning takes place in action learning, the practitioner will be influenced in how he/she designs the action learning program; how the learning advisor/coach may interact with the group; and in what he/she expects as outcomes from the program.

Public Service Electric & Gas Program

The PSE&G program was developed in 1996 to help the Distribution department learn how to be successful in the new competitive environment that was quickly replacing their former regulated, hierarchical world. The objectives established for the program were:

> Enhance the way people communicate and interact with one another.
> Weave quality tools and behaviors into the fabric of the organization.
> Develop and use problem solving and coaching skills.
> Develop an environment of openness and trust and get conflict out on the table.

After two initial pilot sessions, which included the target population (supervisors and managers) in the first pilot, and the senior leaders of the organization in the second, the program has completed 9 sessions with a total of over 250 participants. Each session averages 28 participants formed into 4 teams. The teams address team projects sponsored by senior leaders in the organization. Each team meets for a minimum of 6 ½ days over a 6 week period with a learning coach, and additional days on their own. At the end of the session, each team proposes

recommendations to the entire senior leadership team. Most teams are involved in implementation of their recommendations after the end of the session.

Based on the needs of the organization, and on the beliefs of the action learning practitioner co-designing the program, the design of the initiative would place it in the Experiential school, with some design elements intended to support learning through critical reflection as well. For example, teams used a learning style inventory to help with understanding learning from experience, and an exercise to examine assumptions was used with teams as they began work on their projects. The overall design was aimed at helping develop individual, team and organizational learning. The evaluation process was to determine the success of these efforts.

Methodology

As discussed earlier, there is ongoing evaluation during, and after, each program in order to determine what individuals and teams have learned, and what learning they have carried back to the workplace. In order to try to begin to determine if this individual and team learning was evolving into shared knowledge, if it was becoming more permanent and routine, a 2nd evaluation effort was undertaken. The intent of this 2nd evaluation effort was to try to determine what former participants were seeing elsewhere in the organization that indicated whether or not learning and change were taking place.

The method used for the evaluation was semi-structured interview questions. This method was chosen since the researcher/evaluator was trying to find out past participants' perceptions of their environment and of the action of people around them (Brookfield, 1987), and needed the flexibility to probe for more details and investigate new areas as they arose (Grandstaff and Grandstaff, 1985). There were 4 questions developed that aligned with the 4 objectives of the initiative. The questions used were:

1. Have you found other people in Distribution who are able to say things more openly with you and with others since the start of the program? Why do you think that is?
2. Do you see more teamwork (cooperation) with others inside and outside your department since the start of the program? Why is that?
3. Do you feel people are acting any differently when there is a disagreement now than before the program? What do you think the reason is for that?
4. Do you see the quality tools, or the ideas behind them, being used more now than before the program? What is causing that?

A researcher not connected with the program made the calls. He made the calls on 5/11, 6/15, 7/26, and 7/29-7/31/98. He made attempts to reach all participants who had attended sessions from the pilot through the 6th session—a total of about 200 participants—and was successful in reaching 77 participants who had the time to participate in the interview. The interviewer transcribed responses directly into a computer.

Since the evaluation was trying to determine if there was any evidence of systems-level continuous learning, the following criteria was developed to code the interviews:

Yes, without qualification—interviewee strongly stated/indicated that he/she had seen evidence of learning and change.
Yes, with qualification—interviewee stated/indicated, with some reservation/qualification, that he/she had seen evidence of learning and change.
No, with qualification—interviewee stated/indicated, with some reservation/qualification, that he/she had not seen evidence of learning and change.
No, without qualification—interviewee strongly stated/indicated that he/she had not seen evidence of learning and change.

Two researchers coded the first 5 interviews in order to establish inter-rater reliability. These interviews were coded independently by both researchers, results compared and discussed, and discrepancies resolved. After this check, the first researcher coded the remaining interviews.

Findings

Shown below are the findings from the interviews that are broken down by individual questions. Examples of interviewees' responses from each category are also provided.

1. Have you found other people in Distribution who are able to say things more openly with you and with others since the start of the program? Why do you think that is?

	Number of participants	Percentage of total responses
Yes, without qualification	31	40.3
Yes, with qualification	19	24.7
No, with qualification	15	19.5
No, without qualification	12	15.5
Total	77	100.0

Yes, without qualification—"Yes, I think the program has allowed them to focus their attention in a manner that they are not afraid to speak up whether they say it the right way or not."
Yes, with qualification—"Yes, the supervisors here that have gone through the program are a little bit more open to say things than the ones that have not gone through it"
No, with qualification—"No, I think we have always had an open dialogue. ... One difference I was put in a situation ... the moderator asked me a question about the new organization and I gave it. In the past the person leading the meeting would not have even asked that question and I would not have had the opportunity to volunteer."
No, without qualification—"No, I have not seen any change. The people who were good communicators before are still good communications, and those that were not before the program are still not."

2. Do you see more teamwork (cooperation) with others inside and outside your department since the start of the program? Why is that?

	Number of participants	Percentage of total responses
Yes, without qualification	37	48.0
Yes, with qualification	17	22.1
No, with qualification	16	20.8
No, without qualification	7	9.1
Total	77	100.0

Yes, without qualification—"Our teamwork is excellent. I know that as we move towards a more competitive environment, we need to work even closer together. I think that people are much better at listening."
Yes, with qualification—"Yes I do see more cooperation between the lower echelon trying to have partnerships. Management up on top seems to still want the control, and you can cut them right in half in that regard."
No, with qualification—"No. I do see more, but I am not sure what is causing it. We have been going through downsizing, which I believe is causing us to keep more people in the loop. It is possibly a combination of the two."
No, without qualification—"No, I think a lot of it has to do with ego, and our goals do not compliment each other's goals".

3. Do you feel people are acting any differently when there is a disagreement now than before the program? What do you think the reason is for that is?

	Number of participants	Percentage of total responses
Yes, without qualification	32	41.6
Yes, with qualification	20	26.0
No, with qualification	19	24.6
No, without qualification	6	7.8
Total	77	100.0

Yes, without qualification—"Yes, they are more willing to listen, to take two steps back and listen. Before people would be argumentative."

Yes, with qualification—"Yes, I might have a disagreement with someone at my level. In the past there would be a stalemate, but now are supervisors are watching, and they will step in to rectify the situation if necessary. So I think resolving disagreements is happening."

No, with qualification—"People are listening and understanding more in disagreements, but to say they are acting differently, I can't say."

No, without qualification—"No, the culture is entrenched, and I do not think that the program is going to change PSE&G's culture."

4. Do you see the quality tools, or the ideas behind them, being used more now than before the program? What is causing that?

	Number of participants	Percentage of total responses
Yes, without qualification	46	59.7
Yes, with qualification	15	19.5
No, with qualification	11	14.3
No, without qualification	5	6.5
Total	77	100.0

Yes, without qualification—"Yes, absolutely because people are aware of the quality tools. ... If I tell a person the answer is no, I now explain why. This has already helped me in my communication skills."

Yes, with qualification—"We have talked a lot about the quality tools before the program. ... However the people that have attended the program have shown an improvement in using the quality tools. They are more aware of how to use these tools."

No, with qualification—"I think it is an inconsistent message from upper management, and they do not lead by example. ... Upper management is demanding we follow the quality behaviors, but they do not always themselves."

No, without qualification—"No, you need time to systematically solve problems and we are always fighting fires. We are not given an opportunity to use them properly. There is a lot more frustration because of that."

Analysis and Conclusions

The findings indicate that the individual and team learning participants gained from the action learning program has begun to become a part of the organization. Going back to the earlier stated descriptions of systems-level continuous/organizational learning, interviewees have begun to see some restructuring of organizational theories of action, "Yes, I think that people are starting to believe that upper and middle management want people to express their feelings and ideas". Some of what is being seen builds on past organizational memory, and is changing the mental models in the organization.

> "Yes, we are not a lot of hot heads anymore. We are acting more grown up, more mature, more professional. We have less stress because of the way we are dealing with disagreements. We are using more of the reflection part of the program. It is more of an "us" concept."

There is evidence that there are systems in place to help learning endure, "We are starting to get a complete buy in on the program, and I am starting to see that happening both inside and outside the department".

One way to think about why this action learning program has helped PSE&G develop systems-level continuous learning is by looking at the intervention through the lenses of some of the learning organization theories in the literature. Some of these theories include Senge's 5 disciplines (1990); Beckhard and Pritchard's profile of a learning organization (1992); Redding and Catalanello's theory of strategic readiness (1994); and Marsick and Watkins' action imperatives (forthcoming; Watkins & Marsick, 1995). Marsick and Watkins' framework seems most appropriate to use for analysis since they most explicitly advocate the use of action technologies such as action learning to help create learning organizations.

In their work, they discuss action imperatives—activities in which they think organizations need to engage in order to become learning organizations—at the individual, team and organizational level. At the organizational level, they have found 4 action imperatives—establish systems to capture and share learning, empower people towards a collective vision, connect the organization to its environment, and provide strategic leadership for learning. PSE&G has engaged in activities in support of the action learning program that fit with these action imperatives.

In order to help establish systems that will serve to capture and share the learning coming from the action learning program, PSE&G has made a number of efforts. Key to sharing learning has been the decision and dedication to have a significant number of members of the organization participate in the program. To date, there have been over 250 graduates, and the commitment to enable a total of 60% of the population to attend the program by the end of 1999. In order to continue to sustain learning in graduates, the organization has had 2 "learning days" during which up to 90 graduates participated in exercises to review and reinforce what they took away from the program. Finally, the organization has begun to integrate the expected learning and change into their evaluation system.

The vision for change and transformation in the organization has been frequently and clearly communicated by the senior vice president and other senior leaders since the beginning of the program. The vision stresses the importance of a combination of new behavior and results in order to achieve success. The senior vice president stresses this vision at every opportunity both within and outside of the program. The new behaviors wanted in the organization are further reinforced through the objectives of the program.

PSE&G has an established history of being connected with the community and environment. This connection has been seen in the program, as well, through the choice of some of the projects for teams. These projects have included improving interaction with municipalities, customer service oriented projects, and projects that have stressed volunteerism in the community.

Finally, providing strategic leadership for learning showed up in several ways. The senior vice president and his senior leaders all attended the program as participants in the 2nd pilot session. As the program rolled-out in the organization, the senior leaders assumed the sponsorship role, with many of them sponsoring more than 1 team. The program ends with a full day of presentations with the teams focusing on their learning and their project recommendations. Unless they happen to be out for the day, the senior vice president and all his senior leaders attend every closing day session.

This action learning program has provided a means through which PSE&G has been able to create and sustain systems-level continuous learning. Part of the reason for this may be the magnitude and duration of the intervention. It also appears that the organization has been working to implement a number of action imperatives that Marsick and Watkins' research have demonstrated are important for systems-level continuous learning.

Based on these results, future research in this area could look at a number of issues. How extensive does an intervention need to be to generate systems-level continuous learning? What other kinds of interventions would be as effective as action learning? What else are organizations doing (or should be doing) to reinforce and sustain systems-level continuous learning?

Expatriate Managers and HRD: The Missing Link

Teresa M. Palmer
Iris I. Varner
Illinois State University

Despite considerable research in the area of expatriate assignments, the failure rate continues to be high. This paper reviews the literature on selection, training, retention, and organizational strategy related to expatriate assignments. The authors present a model that ties international human resource development to the strategic goals and mission of the organization.

Keywords: Expatriate Managers, Expatriate Training

Since the late 1970s, the world has experienced extraordinary growth in global business due to the reduction/removal of trade barriers and improved communication. In addition to the growth in total volume of world business, the number of businesses involved in international ventures and the importance of those international ventures to the organizations' well-being have grown markedly. As a result of these developments many of these businesses have increased their numbers of expatriate managers along with this increased focus on global operations. During this same period, there has also been a tremendous growth in the volume of literature addressing issues related to expatriate assignments in management. Despite the considerable increase in literature (much of it research-based), the level of concern about the effectiveness of expatriate managers' performance appears to be undiminished. Shay and Tracey (1997) found that 25 to 40 percent of American expatriates return early if posted to developed countries and that the failure rate increased to 70 percent if the expatriate was posted to a developing country. These rates were similar to those found in other studies reported over more than the last 20 years (Baker and Ivancevich, 1971; Black and Mendenhall, 1990; Deshpande and Viswesvaran, 1992; Tung, 1981). The explicit costs of such early returns vary, but various studies suggested that each such failure costs the organization between $55,000 and $1 million (Copeland and Griggs, 1985; Deshpande and Viswesvaran, 1992; Harris and Moran, 1987; Shay and Tracey, 1997). This represents a significant expense to the organizations involved and does not include the costs associated with the possible loss of human capital investment if the organization loses the expatriate manager as a result of the incident. A variety of studies examine the causes of expatriate failure and suggest ways of improving the success of expatriate assignments (Black and Mendenhall, 1989; Inkson, et al., 1997; Katz and Seifer, 1996; Nicholson, Stepina, and Hochwarter, 1990; Shay and Tracey, 1997). While these and numerous other studies support the potential of training to improving expatriate performance and reducing of the failure rate, additional studies document how little training is actually provided to expatriates. Tung (1981) found that 32 percent of companies provide training for foreign assignments. Mendenhall, Dunbar, and Oddou (1987) believe that number to be as low as 10 percent. They go on to suggest that the reasons that organizations do not use training more often to prepare managers for expatriate assignments are linked to top management's perceptions that such training is unnecessary, ineffective, inconvenient or difficult to find, and too costly.

Research Question

This paper addresses the following research question:

> What do we know from research about the factors related to the successful/unsuccessful performance of expatriate managers?

Additionally, we propose a model for linking HRD decisions to overall organizational strategy when making decisions related to the use and preparation of expatriates.

Factors Related to the Success and Failure of International Assignments

Success in international assignments has not been clearly defined in the literature. In practice, success is most commonly inferred as the absence of failure. Numerous studies address desirable attitudes for expatriate managers and/or identify organizational activities that are associated with improved performance. In theory, there are many ways of judging the failure of international assignments. In most of the research, failure falls into one of these three categories: failure based on early return from the assignment, failure based on inadequate performance of the

Copyright © 1999 Teresa Palmer

expatriate while on the assignment, and failure based on loss of human capital to the organization related to the international assignment. These are illustrated in the following review of literature

Tung's (1981) early research on expatriate managers identified the three most common reasons that expatriates returned early from an assignment as: (1) the spouse couldn't adapt to the new culture, (2) the manager couldn't adapt to the new culture, and (3) the family experienced serious problems related to the assignment. In Shay and Tracey's (1997) study of expatriate managers in the hotel industry, findings of the reasons for failure in overseas assignments were consistent with Tung's (1981) first two reasons. But the third most important reason for the failure emerging from their study was the personal or emotional immaturity of the manager. Shay and Tracey (1997) suggested that the importance of relational and social skills in the hotel industry may be greater than for other industries. Five of the top six ranked attributes desirable in expatriate managers were associated with interpersonal and social skills rather than technical skills. They research suggested that there may be differences among industries in the factors that affect success and failure of expatriate assignments.

Selection and Training

Both Tung (1982) and Katz and Seifer (1996) identified three options for staffing overseas positions, parent country nationals, host country nationals, and third country nationals. There are a variety of factors identified as affecting the staffing decision, often dependent upon the nature of the position. Traditionally, the primary consideration in selection has been technical expertise. Numerous studies have suggested that interpersonal skills, family situation, relational abilities, environmental factors, and personality could reasonably be included in selection criteria (Guzzo, Noonan and Elron, 1994; Mendenhall and Oddou, 1987; Tung, 1981, 1982). Nicholson, Stepina, and Hochwarter (1990) suggested that companies should consider matching characteristics of potential expatriates with the cultural profile of the host country. While good training can contribute to enhanced cultural awareness and adaptability, it is not the only way of acquiring such knowledge and skills. Overseas experience whether through programs such as the American Field Service (AFS) or as an independent personal experience, contributes to enhanced cultural understanding (Inkson, et al., 1997; Wilson, 1998). The Inkson (1997) study identifies characteristics of those acquiring overseas experience including the view of cultural experience as important as work, individual is self supporting and curiosity driven, that suggest that overseas experience may be a factor that organizations should consider in the selection process for expatriate assignments. Regardless of the staffing methods used, training is necessary to maximize positive outcomes from overseas assignments.

There is an impressive body of literature on selecting and training managers for international assignments. Researchers have developed models based on learning theory and cognitive processes (Black and Mendenhall, 1990; Guzzo, Noonan, and Elron, 1994; Mendenhall and Wiley, 1994; Nicholson, Stepina, and Hochwarter, 1990) getting away from anecdotal information to theory based arguments for training. Yet, many of the problems identified in the 80's such as inadequate selection procedures, premature departure from foreign assignments, ineffectiveness of expatriates, family problems and influences on job performance are still with us today (Inkson et al.,1997; Nicholson, Stepina, and Hochwarter, 1990; Shay and Tracey, 1997).

Training, and particularly cross cultural training, will allow expatriates to adjust to different cultures more rapidly and, as a result, will enhance their performance in the new environment (see Deshpande). Nicholson, Stepina, and Hochwarter (1990) argue that expatriates must be prepared in three areas – technical, cognitive, and emotional, in order to succeed. They believe that training will sensitize the expatriate to the target culture and as a result, the expatriate will be more effectively socialized which is in the interest of both the expatriate and the company. Expatriates must learn a whole new set of complex rules that apply to the host culture, yet the monocultural expatriate does usually not know how to decipher the rules, let alone adjust to them (Mendenhall and Wiley, 1994). In addition, companies seldom match the characteristics of a potential expatriate with the cultural profile of the host country (Nicholson, Stepina, and Hochwarter, 1990).

There seems to be an agreement that this could be established through training. Based on research, training is believed to reduce the failure rate by 14 percent. Therefore, it is assumed and argued that training is beneficial and companies should provide such training. However, many managers still believe that a good manager is a good manager anywhere; what counts is technical ability rather than cultural sensitivity (Black & Mendenhall, 1989; Mendenhall, Dunbar, and Oddou, 1987).

Employee Retention

Like other kinds of training, employer provided training to prepare employees for expatriate assignments represents an investment in human capital. Such training usually consists of two types, general training and company specific training. General training increases the employee's marginal productivity equally to the employer providing the training and to other employers. Company specific training increases the employee's marginal productivity only to the current employer (Becker, 1993). The greatest proportion of the employer paid training associated with expatriate assignments is general in nature. This may account in part for the apparent reluctance on the part of many employers to adequately prepare their expatriates (and, perhaps, their families) to effectively complete their overseas assignments. Mendenhall, Dunbar, and Oddou (1987) list six reasons why companies are reluctant to provide adequate training for international assignments. In summary, they are: perceived ineffectiveness of such programs by both, management and trainees, lack of time from selection to posting for meaningful training, trend to employ host country nationals, too costly for short term assignments, no perceived need by executives. In short, the perception is that such programs are too costly, not effective, and not necessary. If that is what executive actually believe, no model for training, no matter how good, will convince them that they should invest in such training.

Failure to train, lack of support, and ineffective repatriation for employees after the overseas assignments contributes to the loss of employees and the company's significant human capital investment in them. The status of the psychological contact between employees and expatriates mediates the relationship between the employee practice and the retention of expatriates (Guzzo, Noonan, and Elron, 1994). What an employer does to support an employee during an expatriate assignment and during repatriation influences the employee's decision to remain with the employer or leave during or after the assignment.

Organizational Strategy

The trend to polycentric staffing has given many managers the feeling that all they need to do is hire host country nationals, and their intercultural problems will go away or be solved easily (Kobrin, 1988; Tung, 1981). After all, many foreigners have received MBAs from American universities. They speak English; they have lived in the U.S. for several years, and they know their home turf. This appears much more cost effective than training an American to do that same work. The question of course is whether this will solve the current problem and help in global competition. Kobrin (1988) maintains that the changes in staffing have an impact on strategic management in four distinct areas: the development of corporate worldwide objectives, employee identification with the entire organization rather than just a local subsidiary, relationship between subsidiaries and headquarters, internationalization of home country employees. Kobrin is one of the few researchers who explicitly ties the need for training to the overall corporate strategy. In his view, the successful global organization will need people who have a grasp of the global environment and how the corporation fits into this. The need for direct social contact in the host environment is not just nice to have but essential in reaching corporate goals. Training then, if one follows Kobrin's argument, is necessary to meet corporate objectives of the global firm. The training needs to help the expatriate to learn the appropriate culture of the subsidiary country and the subsidiary organization while at the same time understanding the overall corporate goals and mission (Black and Mendenhall, 1989; Katz and Seifer, 1996).

A Proposed Model of Organizational Decision Making

Human resource decisions related to an organization's international operations are very complex. There are many factors that can affect those decisions and not all of them are predictable and controllable by the organization. The model for organizational decision making shown in Figure 1 represents the process that should guide organizations in making decisions about how to staff international positions; how to select, prepare for expatriation and repatriate staff and integrate international experience into career paths within the organization. There are three stages that occur in sequential order. Decisions made in stages 2 and 3 are dependent on decisions made in earlier stages. The model we present here links decisions about career development, training, and organization development to the mission of the organization.

In stage 1, the organization must assure that its international human resource decisions are in alignment with overall organization mission and goals. On the very low end of the continuum of criticality/instrumentality might be the expectation that the organization sees international operations as an occasional source of sales and/or supply opportunities that are very flexible and may be expected to change frequently with market changes both at

home and abroad. A domestic company that sells its occasional oversupply to buyers in other countries would fit here. On the very high end of the continuum, we would expect to find organizations that see international operations as critical to the organization's overall success and have a high degree of interdependence between domestic and international operations. These organizations respond to local market needs while integrating global operations for organizational effectiveness. A manufacturing company that produces and markets products to the specifications of numerous countries while allocating production and purchasing supplies to take advantage of world market differentials would fit here. Long range goals and objectives reflect the expectation that the importance of international operations to the organization would remain constant or grow.

Some of the indicators of the degree of criticality/instrumentality include the following questions.
How important are non-domestic markets and suppliers to the success of the organization? What do the mission and goals say about the international operations? What proportion of the revenues/profits are tied to international operations? What is the degree of interdependence between the organization's domestic and international operations? These can range from contracts of limited scope and duration to significant corporate investment in many countries. Are the planned relationships between the organization and it's
international operations/partners short term or long term?

After careful assessment of the importance of international operations to the organization's mission, goals, and objectives, it is time to move to stage 2, decisions.

The position of an organization on the criticality/instrumentality continuum in stage 1 will shape the nature of international assignments within the organization. Those that are very low in stage 1are far more likely to limit assignments to short terms and give expatriates limited responsibilities. They are also more likely to place heavier reliance on host country nationals and third country nationals than organizations on the very high end of the scale. They may outsource significant parts of their international operations to host country companies. The higher the organization's position on the criticality/instrumentality scale, the more likely it is to have expatriate positions of longer term (3 to 5 years) and greater responsibility in addition to a greater number of positions at a variety of positions on
the scope and term of assignments continuum. If the perceived importance of the international operations is high, the organization should provide a variety of opportunities for it's employees to gain international experience, starting early in the employees careers so that they are better prepared for the longer term.
assignments with broad responsibilities later in their careers. Additionally, international expertise and experience should be factored into career ladders and expectations for managers in companies that are higher on the continuum in stage one.

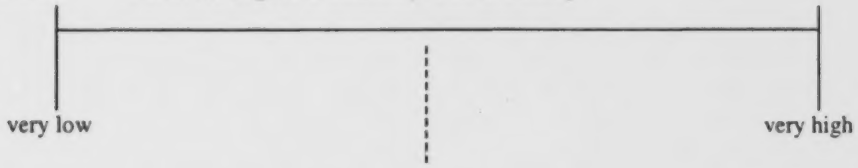
Stage 3 focuses on the organization's decision related to the preparation for and support of the expatriate. Decisions here will be based upon the importance of international assignments to the organization's overall mission and goals and the nature, duration and type of the particular assignment. On the low end of the scale might be a short term technical assignment with narrow focus for which travel arrangements and local contacts are provided for the employee, who also receives a briefing related to the assignment itself. At the other end of the scale would be a multi year expatriate assignment with broad responsibilities, such as an operations manager for a production facility. One would expect the organization to provide a package including travel and relocation assistance for the employee and his/her family, plus a significant amount of training and preparation related to the assignment, and training in the language, culture, and business practices in the new location. Some language and cultural training may also be provided to the family. Additionally, repatriation will be supported by the organization, and the knowledge and skill gained by the expatriate during the assignment will be used by the organization upon repatriation. International assignments will be integrated into the career tracks within the organization

This model presents a systematic approach that ties human resource development to the mission and operations of the firm. Specific training decisions should be made only after the three stages have been completed. This process should be an integral part of any high performance human resource system.

Figure 1 Organizational Decision Making Model for International Staffing

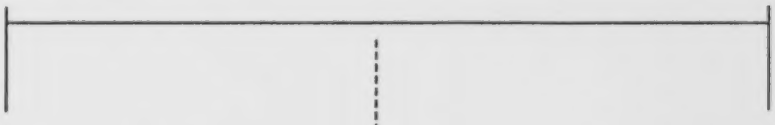
Stage 1 : Determine the importance of international operations to the organization's mission and goals.

Continuum: Perceived degree of criticality/ instrumentality



Stage 2: Determine the Nature of International Assignments

Continuum: Scope and term of assignments



- short term
- focused responsibility

- long term
- broad responsibility

Stage 3: Determine Amount of Human Capital Investment

Continuum: Preparation for international assignments and integration of assignments into career development.

- minimal preparation for job specific assignment
- travel assistance

- extensive preparation and support for assignments
- international assignments integrated into career tracks within organizations

Managerial Practices to Facilitate Learning Within Learning Organizations

Andrea D. Ellinger
The Pennsylvania State University - Harrisburg

This paper reports some of the findings from a larger qualitative critical incident study that was designed to investigate the multiple ways managers facilitate the learning of their employees when they perceive themselves to be facilitators of learning. Managerial beliefs which undergird behavior, the catalysts for learning, and the outcomes associated with learning were also examined, however, only the findings associated with managers' behaviors will be presented.

Keywords: Learning Organization, Coaching, Facilitating Learning

Many organizations are being challenged to remain competitive in a turbulent global business environment through continuous innovation, knowledge creation, and sustained organization-wide learning (Nonaka, 1991; Senge, 1990a; Watkins & Marsick, 1993, 1996a, 1996b). Given this challenge to create learning organizations, several scholars have articulated the need for empirical research on how managers can build learning capability (Ulrich, Von Glinow & Jick, 1993), and the management practices and their configurations that can help to guide managers in their efforts to build learning organizations (Slater & Narver, 1994).

At the heart of the learning organization is the enhanced capacity for continuous learning (Watkins & Marsick, 1993). Continuous learning represents an integration of formal and informal learning. Although trainers and human resource developers have traditionally been charged with providing formal learning, several scholars and practitioners are suggesting that trainers and human resource developers will become consultants, and designers of learning interventions. The learning organization literature has also speculated that managers will be challenged to assume roles as teachers (Senge, 1990a, 1990b; Wisdom & Denton, 1991) coaches (Conger, 1993, Evered & Selman, 1989; Frohman, 1978, Marsh, 1992, McGill & Slocum, 1998; Slater & Narver, 1995), educators (Antonioni, 1994), and facilitators (Weaver & Farrell, 1997). Watkins and Marsick (1992, 1993) contend that "human resource developers can extend their impact in almost exponential fashion by working with all employees to make self-managed learning more effective and by creating new ways for people to share what they learn" (p. 21). At the same time, they can work with managers to create a culture for learning, and help build the infrastructure for learning. Additionally, they can provide coaching and train-the-trainer expertise to managers who will increasingly have the task of providing training and development to their employees (McLagan, 1996; Ulrich, Brockbank, Yeung & Lake, 1995; Watkins & Marsick, 1993). This trend represents a shift away from formal instructor provided training and development to informal, just in time learning which is integrated with work. Despite all of the conceptions and descriptions of these changing roles for managers, little empirical research has examined the dramatically altered realities of managerial work (Kanter, 1989). Therefore, the purpose of this study was to examine the multiple ways that managers facilitate the learning of their employees when they perceive themselves to be facilitators of learning within learning organizations (Ellinger, 1997). Although four research questions guided the overall study, the following question is addressed in this paper:

(1) What are the types of behaviors that contribute to the role of managers as facilitators of learning?

Conceptual Framework

An adaptation of the Campbell, Dunnette, Lawler, and Weick model (1970) and Clawson's (1992) Person-Role Model formed the conceptual model which served as the framework for the study. The Campell et al. model, the person-process-product model (Morse & Wagner, 1978), is a heuristic model which is a schematic portrayal of factors determining the expression of managerial behaviors. The person in this model refers to an individual enacting a role. This person brings belief systems that are influenced by the individual's characteristics, abilities, and developmental experiences to the role he or she is stepping into. The process refers to the person's on-the-job behaviors and activities, and the product refers to the outcomes associated with enacting the behavior. The Campbell et al. model makes it apparent that the person's behavior is directed by many different factors and by the interactions between them. Clawson's model differs slightly in that she suggests that multiple behavior types inform the delineation of a person's role.

Copyright © 1999 Andrea D. Ellinger

For this study, within the context of learning organizations, the managers' belief systems are thought to influence the manager's adoption of the role of facilitator of learning. In adopting this role and serving as a facilitator of learning, it was thought that managers engage in learning episodes with their employees that are initiated by catalysts for learning. Once a learning episode is initiated, it was thought that managers would execute behaviors that could be categorized into behavior types that help to define the role of facilitator of learning. It was anticipated that outcomes would be associated with the learning episodes for learners, managers, and possibly the organization. This model was furnished as a point of reference, a framework for the study, but was not empirically tested.

Methodology

The design of the research study was a descriptive qualitative approach using the Critical Incident Technique (Flanagan, 1954) and semi-structured interviews (Kvale, 1996) as the primary methods of data collection.

In Action: Creating the Learning Organization (Watkins & Marsick, 1996b), a casebook published by the American Society for Training and Development served as the population from which a purposeful sample of five organizations was drawn using intensity sampling selection strategies (Patton, 1990). Four organizations actually participated in the study, and through an expert nomination process, twelve managers were recommended to the researcher as being exemplary facilitators of learning within their respective organizations. The twelve managers agreed to participate in the study, and in-depth face-to-face interviews were conducted with each manager which averaged at least two hours in length. The managers were asked to describe at least four effective and/or ineffective critical incidents when they perceived themselves to be facilitating their employees' learning. The interviews were tape recorded and transcribed verbatim by the researcher. An average of 4.6 incidents was collected from each manager which resulted in a total of 56 critical incidents.

Content analysis was employed to initially analyze the data (Weber, 1990). The unit of analysis was the critical incident, and the sentence was selected as the unit of analysis among content coding unit options within the critical incidents. All sentences within the data set were rigorously reviewed and those meeting the framework category definition of 'behaviors' formed this category. A total of 322 sentences, or data strips were identified that met the definitional criteria for 'behaviors.' Then, using a file card approach recommended by Guba and Lincoln (1981), the data strips in this category were thematically classified using open coding (Strauss & Corbin, 1990). To ensure internal consistency, member checking was employed (Merriam & Simpson, 1995). Additionally, an external reviewer with fifteen years of managerial experience also participated in the coding process. The researcher and external reviewer sorted the file cards independently. The results of the open coding process were recorded and compared. Although there was general consistency among the themes that emerged, multiple sorts were done to reconcile minor discrepancies until complete consensus was achieved between the researcher and external reviewer. This process helped to establish reliability in coding of emergent themes to achieve semantic validity (Weber, 1990).

Findings and Discussion

A total of three hundred twenty two (322) data strips coded as behaviors (37.2% of the total number of data strips) were identified within the entire data set which consisted of a total of eight hundred sixty-six data strips (866).. These behaviors represented actions, or sets of actions that the manager employed when he/she was engaged in facilitating learning. Thirteen (13) themes emerged within the framework category of behaviors and formed two clusters of behaviors. These themes represent types of behaviors, or sets of behaviors that managers enacted as facilitators of learning. Figure 1 depicts these two clusters and the thirteen behavior sets which define the role of facilitator of learning for this study. Based upon the data, these behavior sets may be operationalized as managers' empowering behaviors and their facilitating behaviors. These behavior sets were observed consistently in the critical incidents reported by all of the managers in the study, not only those managers affiliated with learning organization initiatives for the longest period of time. It is important to note that 'coaching' was used synonymously with 'facilitating learning' by 11 of the 12 managers participating in the study, therefore, their 'coaching' terminology is used in this paper.

Clusters of Behavior Sets	
Empowering	Facilitating
Holding Back -- Not Providing the Answers	Creating and Promoting a Learning Environment
Question Framing to Encourage Employees to Think Through Issues	Broadening Employees' Perspectives -- Getting Them to See Things Differently
Transferring Ownership to Employees	Stepping Into Other to Shift Perspectives
Being a Resource -- Removing Obstacles	Using Analogies, Scenarios, and Examples
	Setting and Communicating Expectations -- Fitting into the Big Picture
	Working It Out Together -- Talking it Through
	Engaging Others to Facilitate Learning
	Providing Feedback to Employees
	Soliciting Feedback from Employees

Figure 1. Clusters of behavior sets associated with the role of facilitator of learning
Source: Ellinger, 1997

Although it can be argued that managers who adopt and assume the role of facilitator of learning, or coach still maintain the potential to exercise considerable control over their employees because of the position and authority power they possess, this study suggests that managers attempt to facilitate learning for their employees by moving toward an empowerment paradigm which is demonstrated in the empowering behaviors they enact. In this study, facilitators of learning used both empowering and facilitating behaviors with their employees. As Figure 1 depicts, managers enacted four types of Empowering behavior sets and nine types of Facilitating behavior sets when they perceived themselves to be facilitating learning. Grounded in the data, the cluster of Empowering behavior sets referred to managers' behaviors that appeared to encourage employees to assume personal responsibility and accountability. Managers alluded to not providing solutions or answers to employees, and often responded to questions by asking different, thought provoking questions to encourage their employees to derive their own solutions. Whereas the Empowering cluster was predominantly oriented towards managers' behaviors of giving more power and authority to employees, the cluster of Facilitating behavior sets was slightly different. In this cluster grounded in the data, the notion of Facilitating behaviors appeared to be oriented towards managers' behaviors that promoted new levels of understanding, new perspectives, and offered guidance and support to their employees to foster learning and development.

The emergence of these thirteen behavior sets is significant because most managerial behavior taxonomies have captured the more formal aspects of training and instructing subordinates associated with the concept of facilitating learning (Borman & Brush, 1993; Kraut, Pedigro, McKenna, & Dunnette, 1989; Mintzberg, 1973, 1990; Yukl, 1981, 1989, 1994). Aside from suggesting that managers engage in behaviors that coach, mentor, train and develop employees, few, if any of these taxonomies have provided specific descriptions of the actual behaviors that are manifested in coaching, mentoring, training and developing employees.

The behaviors that managers reported they enacted when they perceived themselves to be serving as facilitators or learning, or coaches were somewhat different from the traditional components of coaching models that have been reported in the literature. Traditional coaching models generally incorporate the concept of interactive communication in which the coach listens, gives feedback, and clarifies expectations of the employee (Evered & Selman, 1989). Schelling's (in Graham, Wedman, & Garvin-Kester, 1993, 1994) research identified eight coaching skills that included communicating clear sales objectives, providing regular performance feedback, and providing help, training, and guidance. While many of the approaches to coaching in the literature are oriented to problem solving and performance improvement, the findings from this study are distinct in that they focus more on the learning component from which improved performance appears to be a by-product.

The specific behaviors in this study that are similar to some of those behaviors or skills identified in the coaching literature include "setting and communicating expectations -- fitting into the big picture," and "providing feedback to employees" (Evered & Selman, 1989; Graham, Wedman, & Garvin-Kester, 1993, 1994; Marsh, 1992; Yukl, 1994). Yukl's (1994) guidelines for coaching include explaining why additional training is relevant, and encouraging application of skills on the job. His guidelines for mentoring include encouraging enrollment in

relevant training programs, providing special opportunities for skill development and helping the employees learn from experience. Despite some of the similarities with Yukl (1994), there were distinguishing factors associated with "setting and communicating expectations -- fitting into the big picture" and "providing feedback to employees" in this study. Setting expectations in this study also included the concept of communicating the importance of these expectations and objectives so that employees would understand why objectives were important and how their efforts in meeting objectives impacted the organization. This idea of managers explaining how employees fit into the big picture was a subtle, but important difference.

Despite the emergence of the concept of giving feedback which is typically a component in most coaching models, in this study, three variations of providing feedback were reported by managers: observational, reflective, and third-party feedback. Managers provided observational feedback in which they related observing behavior that could be detrimental to the employee, or provided feedback in terms of performance reviews about observed strengths and areas for future development. Managers also engaged in providing reflective feedback in which they 'held the mirror' so that employees could make their own assessments about how their behavior impacted others within the organization. The third type of feedback managers provided was third-party feedback in which managers would solicit feedback from the employee's internal customers, or through anonymous survey feedback instruments that the manager and employee would create together. Another distinct behavior included soliciting feedback from their employees to gauge if employees were having problems or were comfortable performing their work related tasks. Orth, Wilkinson and Benfari (1987) use the terms of coach and mentor interchangeably, however, they contend that coaches and mentors must have observational skills to monitor an employee's performance. This skill set is most closely aligned with the concept of observational feedback in the current study.

Orth et al. (1987) contend that mentors also need to possess interviewing skills in which they ask open-ended, closed, and reflective questions to employees to encourage the employees to think, or rethink what he or she may not have considered previously. Similarly, behaviors reported by managers in the current study related to the themes of "question framing to encourage employees to think through issues" and "using analogies, scenarios, and examples" to facilitate employees' learning. Rather than providing solutions, managers in the current study would frame and pose questions to their employees to encourage them to think through solutions themselves. Generally, the types of questions managers posed related to having employees consider the potential consequences of their actions, or to anticipate the results of their actions within specific contexts. Providing examples and analogies were used to help employees see how similar approaches could be applied in their own circumstances, without the managers directing or imposing specific solutions.

Three additional behaviors which managers enacted included "holding back -- not providing the answers", "being a resource -- removing obstacles" and "transferring ownership to employees." Although these behaviors would appear to be implicit in the concept of coaching, managers in this study specifically made it clear to their employees that they would provide help, but would not assume the employees' responsibilities. Managers specifically indicated that they would not provide answers, and would not perform employees tasks.

Hout and Carter (1995) and Barlett and Ghoshal (1995) have suggested that the task of management is to adopt a people-oriented approach to management, and that relationships and communication will become increasingly important within organizations. The theme of "working it out together --- talking it through" corresponds to their findings as managers in the current study engaged in one-on-one or work group based conversations designed to talk through issues and reach consensus about the overall approach. Managers acted in highly facilitative capacities when they engaged this type of behavior to facilitate learning.

Two additional themes new to the coaching literature include: "stepping into other to shift perspectives" and "broadening employees' perspectives -- getting them to see things differently." These behaviors are significant because they connect to the organizational learning literature and the learning organization literature. Senge (1990a, 1990b) and Argyris (1977) acknowledge that surfacing mental models and closely held assumptions can facilitate individual learning. Senge would suggest that leaders in the learning organization have a responsibility to surface and test mental models to facilitate individual learning which then has the potential to effect the organization more broadly. Smiley (1992) has suggested that managers should become schemata modifiers. Engaging in these behaviors may help managers to understand why employees behave as they do, and ultimately help to change their cognitive processes. Managers attempted to encourage employees to step out of their own mental frames and step into another person's mental frame. This was done to encourage employees to think differently from a perspective other than their own. This type of behavior was also used by managers to view the world from the employees' perspectives. This theme of "stepping into other to shift perspectives" differs from "broadening employees' perspectives -- getting them to see things differently" in that the behaviors managers engaged to broaden employees perspectives included providing exposure to other facets of the organization through work rotations and other activities.

A final theme reported by managers was "creating and promoting a learning environment." This theme corresponds to the literature on the learning organization in which managers are encouraged to create continuous learning opportunities, and establish systems that capture and share learning (Watkins & Marsick, 1993, 1996a, 1996b). Here, managers reported their activities as attempting to build learning departments by actively engaging in department meetings, fostering mentoring relationships among employees, and creating informal learning opportunities such as job matrices and participation in interview processes.

Some of the behaviors that managers articulated when they served as facilitators of learning are variations of some of the components that have been identified within existing coaching models. However, collectively these behaviors present a detailed view of how coaching can be facilitated informally in organizations by managers. These behaviors add a deeper dimension to existing managerial taxonomies and further elucidate what is meant by the broad terminology of coaching.

Limitations

There are several limitations to this study that should be addressed. One of the limitations of this study was obtaining managers' perceptions of the behaviors they enacted when they perceived themselves to be facilitating learning using the critical incident technique. It is possible that employees may disagree with their managers' perceptions. However, the intent of this qualitative study was to seek understanding of this phenomenon from managers perceived to be exemplary facilitators of learning based upon their perceptions of the ways in which they facilitate the learning of their employees. This study is also a purposeful sample of twelve managers, therefore, generalizability is limited and this study does not purport to address all of the factors associated with how managers can build learning organizations. Lastly, the number of critical incidents collected is adequate for an exploratory study, however, expanding the sample size and volume of critical incidents is recommended to further develop the classification system.

Contributions and Future Research

This study provided insight into the ways in which managers facilitate the learning of their employees in learning organizations. Despite some of the limitations, there are several implications for practice and research.

Implications for Practice

This study is relevant to the management, adult education, and human resource development fields for a number of reasons. The learning organization literature has speculated that managers and leaders' roles will continue to change in organizations seeking to become more learning oriented. Therefore, as managers and leaders assume roles that include more teaching, coaching, education, and development responsibilities, trainers and human resource development practitioners traditionally responsible for such training, coaching, and development functions may no longer be considered the sole providers of these services, but part of a much broader learning infrastructure. As a result, it is possible that an increasing number of the adult educators, trainers, and developers in the workplace will be managers and leaders. Watkins and Marsick (1992, p. 128) have acknowledged that "experiments in teaching managers to be facilitators, coaches, interpreters and guides hold promise." This study provides trainers and human resource development professionals with thirteen behaviorally grounded behavior sets that help to define the role of facilitator of learning which can be used within organizations to help managers become more skilled at facilitating learning. These behavior sets can be integrated with existing coaching models, and incorporated into the content of management development programs.

Implications for Research

The findings from this study extend the current research on managerial behaviors in learning organizations. Additionally, these findings extend the existing research on managerial behavior taxonomies by providing a micro-level investigation of behaviors that are manifested in coaching, or facilitating learning by exemplary managers participating in this study. There is a growing body of literature on coaching, however, it tends to be atheoretical (Popper & Lipshitz, 1992), and only a few empirical studies have been conducted which examine what good coaches do, and the relationship between preferred models of coaching and improved performance (Graham,

Wedman, & Garvin-Kester, 1993, 1994; Marsh, 1992). This study fills this void by providing researchers and practitioners with thirteen behavior sets that define the role of coach, or facilitator of learning. Some of these behavior sets represent components of existing coaching models, however, a few new behavior sets expand the concept of coaching.

The critically anchored behavior sets identified in this study offer a foundation upon which other researchers can build so that the management practices required to build learning organizations can be expanded. To overcome some of the limitations of this research, the researcher recommends that future research include using manager and employee dyads as an approach to obtaining critical incidents so that employees' perceptions of the ways in which their managers may facilitate learning can also be incorporated into the behavior sets that define the role of coach, or facilitator of learning. Expanding the number of participating managers and organizations to generate a larger number of critical incidents may also be a way to further develop a richer classification of behavior sets. Ultimately, incorporating these behavior sets into a survey instrument to assess how pervasive coaching is, and the predominant behavioral strategies used by managers in a broader array of corporations would be a logical next step.

Operationalizing the Organizational Model of Managerial Employee Persistence

Lisa Hanes Netzley
Shari L. Peterson
University of Minnesota

This paper identifies the processes utilized to validate The Organizational Model of Managerial Employee Persistence (Peterson, 1998) which focuses on the role of the organization in integrating employees into the organization, and in turn, is hypothesized to impact their persistence. The Organizational Integration Survey (OIS) for Managerial Employees was developed to operationalize the Model, providing Human Resource Development professionals with a theoretical foundation for expanding their role in the organization-- developing strategies to increase managerial employee integration.

Keywords: Employee Turnover, Organizational Integration Survey, Managerial Persistence

The Organizational Model of Managerial Employee Persistence (Peterson, 1998) was developed to explain managerial employee turnover, particularly that of women and managerial employees of color. This model integrates key components of an organizational model of student attrition (Tinto, 1986) and a variety of employee turnover models (Bannister & Griffeth, 1986; Blau & Boal, 1989; Dalessio, Silverman, & Schuck, 1986; Dougherty, Bluedorn, & Keon, 1985; Hom, Griffeth, & Sellaro, 1984; Lee & Mitchell, 1994; Mobley, 1977; Mobley, Horner, & Hollingsworth, 1978; Steers & Mowday, 1981). What the employee turnover models have in common are the variables job satisfaction and commitment to the organization. These variables serve as major constructs for much of the theory building and research on employee turnover. Thus the traditional employee turnover models focus on attributes of the individual employee. However, those models tend to neglect the importance of the role of the organization in the decision of employees' to stay with or leave the organization. Peterson's (1998) model acknowledges the key individual attributes of employees identified in the traditional turnover models, but focuses on the role of the organization. The Organizational Model of Managerial Employee Persistence suggests that the organization assumes a major responsibility for creating an environment in which employees perceive a connectedness with the organization to the extent that they intend to persist.

This paper identifies the processes utilized to validate the Organizational Model of Managerial Employee Persistence (Peterson, 1998) and describes the development of the survey instrument that will operationalize the model. The theoretical foundation for the model and the first iteration of the model is presented, followed by the processes used to operationalize the model, specifically the development of the survey instrument, establishment of a panel of experts, and analysis of the results of the group feedback session. The refined version of the Organizational Model of Managerial Employee Persistence is presented with plans for testing the model. Finally, implications for Human Resource Development practitioners are offered.

Theoretical Foundation

The theoretical foundation on which the model is based is a student attrition model (Tinto, 1986) that has been validated in a variety of settings, confirming the role of the educational institution in creating an environment in which students perceive that they are integrated into both the academic and social systems of their institution of higher learning. Integration refers to one's sense of connectedness to or belonging in one's organization, developed through experiences in and interactions within the organization. Tinto's (1986) academic attrition model was reconceptualized to acknowledge the role of the external environment (family, friends, employer), particularly for adult learners, in contributing to academic persistence (Schwartz, 1990). It was later determined that a student's career decision-making self-efficacy (confidence in one's ability to engage in information-gathering and decision-making regarding a career) significantly contributed to both social and academic integration (Peterson, 1993) and ultimately to persistence (Peterson & delMas, 1996). It is integration, along with intention to persist which has been found to be the most significant determinant of students' decisions to persist in or depart from their institution. Transferring those findings to an organizational setting to explain employee turnover led to the development of the Organizational Model of Managerial Employee Persistence (Peterson, 1998). The purpose of that model was to integrate employee turnover models (which focus on individual attributes) and the student attrition model (which focuses on the role of the organization) to create a model that would result in a stronger explanation of the variance

Copyright © 1999 Lisa Hanes Netzley

in employee turnover. The hypothesis is that employees who perceive they are integrated into the organization are more likely to persist.

Operationalizing the Organizational Model of Managerial Employee Persistence

The following processes were utilized to develop the Organizational Integration Survey for Managerial Employees which is intended to operationalize the Organizational Model of Managerial Employee Persistence:

1. Development of a draft of a survey instrument with which to measure each of the constructs represented in the model.
2. Establishment of a panel of experts to review and validate the model and draft of the survey instrument and participate in a group feedback session.
3. Analysis of the results of the group feedback session.

Survey Development

Many of the items from the Integration Scale, adapted from Fox (1986) and the Career Decision-Making Survey, adapted from Taylor and Betz (1983) utilized in the Peterson (1993) study which focused on academic and social integration in an institution of higher education adapted to the current survey. For example, questions relating to friendships with other students where adapted to include relationships with co-workers. Questions from the Career Decision-making Survey were adapted to measure the managerial employees' level of confidence in their ability to gather information and make decisions about their careers as well as to measure employees' perceptions of the organization's support for their career development.

Given that base, additional questions were developed for each of the domains of the model. New questions were developed based on turnover literature and from the researchers' experiences in organizations. Each question went through multiple revisions as the survey was restructured and reorganized to represent each of the domains. Approximately 100 questions were included in the original draft of the survey instrument. The variables to be measured by the Organizational Integration Survey for Managerial Employees represent the components of the model and include the following:

- Pre-entry Attributes

Pre-entry attributes reflect the demographic and psychological dimensions of employees prior to joining the organization. These attributes reflect personal characteristics and include demographics, abilities and skills, and career decision-making self-efficacy.

Demographic information (Section I.A. of the survey) includes such characteristics as age, race, gender, and national origin. Abilities refer to educational level and training of employees upon entry into the organization; skills refer to employees' prior work experience (Section I.B. of the survey). Career decision-making self-efficacy (Section II. of the survey) refers to the level of confidence employees have regarding their ability to gather information and make career-related decisions.

- Expectations, Motivation, and Satisfaction (Time 1)

Expectations are the aspirations and valued occupational goals toward which one's activities are directed. Expectations, which predict the likelihood of attaining that desired future, are measured by intentions.

Motivation, often referred to in the context of personality disposition, is measured by goals and commitments. Motivation refers to one's willingness to work toward the attainment of those goals. Goals refer to employees' desired outcomes in the career field in general and within the context of a specific organization in particular. Commitment suggests a pledge of support for a decision made.

In general, satisfaction refers to that which brings gratification or contentment. The myriad factors within and outside an organization which comprise satisfaction are summarized in this model as a single overall satisfaction variable. Thus, Intentions, Goals, Commitment, and Satisfaction comprise Section III of the survey.

- Organizational Experiences

This section (Section IV. of the survey) refers to the experiences and interactions among employees within the organization over a period of time. Those experiences and interactions take place in several contexts, referred to as domains. The model suggests that those interactions take place both formally and informally. Formal experiences are purposely planned interactional events (e.g., formal lines of communication, policies, meetings). Informal experiences tend to be more spontaneous, perhaps serendipitous, opportunities to interact. Formal and informal dimensions are connected, as the opportunities for interactions overlap and often involve the same people (e.g., managers, peers). Thus formal may influence and be influenced by informal experiences and vice versa. Organizational Experiences are represented by the following domains:

Performance Domain. This domain (Section IV.A. of survey) identifies organizational experiences and factors that impact employees' perceptions of their level of performance in the organization. The Performance System includes Job Performance and Interactions with Managers. Factors include perceptions of stress, conflict, support of management, knowledge of job requirements, and performance recognition. Specifically, Job Performance refers to employees' perceptions of their level of performance and competence on the job. Interactions with Managers refers to employees' perceptions of the level of support, concern, and acceptance received from their own manager as well as other managers in the organization.

Organizational Domain. This domain (Section IV.B. of survey) identifies organizational experiences and factors that impact employees' sense of personal belonging in the organization. The organizational system includes opportunities for social interactions with peer groups and co-workers. Factors include organization-supported activities and social events, organizational support of personal development, and interactions and relationships, both personal and professional, among co-workers. Specifically, Social Aspects refers to perceptions of the level of organizational support for the social interaction and personal development of employees, as demonstrated by the type and scope of activities provided by the organization. Interactions with Co-workers refers to employees' perception of their belonging based on the scope and type of interactions between and among co-workers (other than one's immediate supervisor) and peers in the organization.

Career Domain. This domain (Section IV.C. of survey) refers to experiences and factors that impact employees' perceptions of their opportunities to create, develop, and embark upon a career path. Specifically, Information Gathering refers to employees' perception of their opportunities within the organization to obtain information about careers in general as well as information related to their specific career path. Decision-Making refers to employees' perception of opportunities to consider options and make decisions related to their career.

Extra-organizational Domain. The model also acknowledges the reciprocal impact of employees' external systems (e.g., family, community, friends) on the internal organizational system and the importance of organizational support to help employees balance this work, family, and community aspect of their lives. Specifically, External Support (Section IV.D. of survey) refers to the level of support that people outside the organization who are important to employees provide to the employees regarding their organizational responsibilities. Organizational Support refers to organizational experiences and activities that support the balance between organizational and external commitments, such as the employees' responsibilities to family, community, friends, education, military, and/or religious or spiritual affiliations.

- Integration

This variable is the central focus of the model and is measured by the survey. Integration refers to employees' sense of connectedness to or belonging in the organization developed through the experiences and interactions with the organization within the Performance Domain, Organizational Domain, Career Domain, and Extra-organizational Domain. If the results of those interactions are positive, it is expected that employees will perceive a greater sense of integration.

- Expectations, Motivation, and Satisfaction (Time 2)

While an employee comes to an organization with certain background characteristics, intentions, goals and commitments, and general levels of satisfaction, what experiences and opportunities for interaction the organization provides is hypothesized to impact the level of integration in each of the domains noted. Thus it is expected that employees' expectations, motivation, and satisfaction regarding their employment in the organization will develop over time. Thus, Intentions, Goals, Commitment, and Satisfaction comprise Section V. of the survey.

Persistence Outcome

The employees' developed intentions, goals, commitment, and satisfaction, together with integration (Performance Integration, Organizational Integration, Career Integration, and Extra-organizational Integration) will ultimately impact employees' decisions to stay in or depart from the organization. This variable will be measured at the end of six months.

Panel of Experts

Representatives from business and industry, comprising a panel of experts, were identified and asked to participate in a group feedback session regarding the Organizational Model of Managerial Employee Persistence and the Organizational Integration Survey for Managerial Employees described above. The finalized draft of the survey, together with a cover letter to identify the purpose of the group feedback session, a copy of the Organizational Model of Managerial Employee Persistence, and an explanation of each domain of the model were sent to each member of the panel of experts.

Representatives from the following organizations comprised the panel of experts: Ceridian, Norwest/Wells Fargo Banks, Cargill, Dayton Hudson Corporation, Norwest Funding Incorporated, Personnel Decisions International, and the Carlson School of Management at the University of Minnesota. The experts held such titles as Vice President of Human Resource Development, Director of Human Resource Development, Organization Development Specialist, and Regional Personnel Director.

Experts agreed to participate in a 90-minute group feedback session held in the Executive Development Center of the Carlson School of Management at the University of Minnesota. Participants were charged with the responsibility, having had the materials for two weeks prior to the group feedback session, to (1) eliminate repetitive or unnecessary questions, (2) reword ambiguous questions, and (3) suggest new questions for each of the domains within the Organizational Experiences section of the model. They also were asked to evaluate the model and provide feedback on the overall survey.

After the initial welcome and introductions, each participant was assigned a primary section of the survey and asked for the first 15 minutes to focus their notes, based also on their previous analysis, on that section. They were then broken into small groups representing their section of the survey, and asked to come to a consensus in 50 minutes regarding each question in that section. The whole group was reconvened for the final 20 minutes in order to (1) provide input into the other sections of the survey, (2) discuss the merits and shortcomings of the overall survey, and (3) question and critique the components of the model.

The researchers did not participate vocally in the feedback session, but recorded observations and took notes on the content of the discussions. In addition, notes from each of the participants in the panel of experts were collected.

Group Feedback Session

Notes from the individuals who comprised the panel of experts and the group feedback session were reviewed and analyzed. This analysis yielded information that resulted in deletions of questions, changes to current questions, and the addition of new questions. For example, questions within the Organizational Domain were added to address employees' perceived level of camaraderie in the organization. Some of the questions designed to address both personal and professional development issues within each of the domains were merged where to do so made sense. However, it also made sense to revise entire categories of the model for the express purpose of differentiating between those two aspects of development.

The general consensus of the panel of experts was favorable, and the feedback from the group session provided valuable information that allowed the survey to be shortened (one of the goals) without compromising the integrity of the domains that comprise the model. Thus the revisions to the model, while important, were minor.

Refinement of the Organizational Model of Managerial Employee Persistence and Revision of the Organizational Integration Survey for Managerial Employees

The revised Organizational Integration Survey (OIS) for Managerial Employees contains 86 items. Each section, except Section I (demographics) is based on a 5-point Likert Scale. The 86 items are categorized as follows:

- Section I. Personal Characteristics
  - A. Demographics-- 6 questions
  - B. Educational/Professional Experience-- 9 questions
- Section II. Career Decision-Making
  - A. Information Gathering-- 5 questions
  - B. Decision-Making-- 3 questions
- Section III. Intention, Goals, Commitment, & Satisfaction-- 5 questions
- Section IV. Organizational Experiences
  - A. Performance Attributes
    - Job Performance-- 9 questions
    - Interactions with Managers-- 10 questions
  - B. Organizational Attributes
    - Social Aspects-- 8 questions
    - Interactions with Co-workers-- 10 questions
  - C. Career Aspects
    - Information Gathering-- 4 questions
    - Decision Making-- 5 questions
  - D. Extra-organizational Aspects
    - External Support-- 2 questions
    - Organizational Support-- 5 questions
- Section V. Intention, Goals, Commitment, & Satisfaction-- 5 questions

Figure 1 includes a sampling of the 50 questions included in the Organizational Experiences section of the Organizational Integration Survey for Managerial Employees.

Performance Attributes	
Job Performance	*Interactions with Managers*
• I have been recognized for high level performance in addition to my performance reviews. • Overall, I believe I have the appropriate skills to perform in my position. • Others within this organization appear to be satisfied with my work.	• I would feel comfortable discussing work-related issues with my current manager. • I would feel comfortable discussing work-related issues with other managers above me. • My current manager generally is accessible.

Organizational Attributes	
Social Aspects	*Interactions with Co-workers*
• My current manager genuinely is interested in my *personal* growth and development. • This organization celebrates employees' achievements. • This organization sponsors work-related activities of personal interest to employees (e.g., professional seminars, wellness programs).	• It has not been difficult to meet and make friends with other employees in this organization. • There is a sense of camaraderie in this organization. • My co-workers and I support each other in reaching our professional goals.

Career Aspects	
Information Gathering	*Decision-making*
• There are *formal* opportunities to gather information about careers and/or career paths in this organization. • There are *informal* opportunities to gather information about careers and/or career paths in this organization. • This organization encourages employees to become knowledgeable about their careers in general.	• This organization has helped me make decisions regarding my career. • Employees in this organization are consulted about career decisions that affect them. • This organization has helped me achieve my career goals.

Extra-organizational Aspects	
External Support	*Organizational Support*
• People outside this organization who are important to me are understanding of my professional demands. • People outside this organization who are important to me help me balance my personal and professional goals.	• This organization supports employees in their endeavors to balance personal and professional responsibilities. • This organization is considerate toward the interaction between work, community, and family.

Figure 1. Sample questions from the Organizational Integration Survey (OIS) for managerial employees.

Testing the Model

The next phase of this research to operationalize the Organizational Model of Managerial Employee Persistence requires testing the survey. The pilot test will be conducted with managerial employees in a large Minnesota based organization. The pilot test will determine the preliminary reliability of the instrument. Given a large enough sample, exploratory factor analysis will be conducted to determine the cohesiveness of the constructs as they are currently identified.

Once the revisions from the pilot test and the factor analysis are complete, the survey will be administered to a all female managers, all managers of color, and a random sample of Caucasian male managers in 12 randomly selected Minnesota-based organizations, categorized by size. The survey will be conducted with two groups of managerial employees. The first group of managerial employees comprises newcomers to the organization who, in Phase 1 of the study, will complete the Pre-Entry Attributes and Expectations, Motivation, and Satisfaction sections of the survey. In six months, Phase 2 of the study, they will receive the Organizational Experiences Section to measure their level of integration as well as a repeat of the Expectations, Motivation, and Satisfaction Section in order to compare their intention, goals, commitment, and satisfaction at entry with their developed intention, goals, commitment, and satisfaction.

The second group of participants represent employees who have been with the organization for more than three months. These participants will receive the following sections of the survey in Phase 1: Pre-Entry Attributes, Expectations, Motivation, and Satisfaction, and Organizational Experiences. In six months, Phase 2, they will receive a repeat of the Expectations, Motivation, and Satisfaction Section. During the six months of the study, every effort will be made to contact respondents who depart from the organization in order to collect Phase 2 data.The revised Organizational Model of Managerial Employee Persistence is shown in figure 2:

Implications for Human Resource Development

The Organizational Integration Survey for Managerial Employees was developed to operationalize the Organizational Model of Managerial Employee Persistence. The survey included personal characteristics and elements of traditional turnover models, particularly intentions, goals, commitment, and satisfaction, as well as items to measure the perceived level of performance integration, organizational integration, career integration, and extra-organizational integration, each a function of the composite role of the organization. Results of the survey, if found to be reliable, could have implications for the Organizational Model of Managerial Employee Persistence, particularly its applicability in explaining an employee's perceived level of integration in the organization, which in turn is expected to impact the employees' decisions to persist in or depart from the organization.

Pending successful research outcomes, Human Resource Development professionals will have a theoretical foundation for expanding their role in the organization to develop strategies to increase managerial employee

integration. Thus the outcome is an alignment between the goals of human development and those of the organization by contributing to increased managerial employee persistence and decreased turnover.

Critical Thinking, Developmental Learning, and Adaptive Flexibility in Organizational Leaders

Robert Duchesne
Eastern Connecticut State University

Organizational leaders in today's global marketplace must continually make decisions, solve problems, and chart effective courses of action to ensure that their companies survive and flourish. The ability to think critically is essential for today's leaders, yet leaders are often unable to do so. This study examined how developmental learning and adaptive flexibility relate to the level of critical thinking in a sample of organizational leaders. Results showed years of education to be the only significant predictor of critical thinking in the leaders studied. Adaptive flexibility scores indicated minimal levels of reflective observation suggesting automatization of decision-making. The factor analysis of developmental learning experiences identified several factors that characterize the developmental learning of the leaders studied. The theoretical and practical significance of the findings is discussed.

Keywords: Critical Thinking, Leadership Development, Workplace Learning

Critical Thinking

Critical thinking is reasonable, reflective thinking that is focused on what to think or do. It requires an ability to recognize problems, gather pertinent information, interpret data, appraise evidence, and to evaluate lines of thinking, points of view, and personal insights that might contribute to the framing of logical, effective, reality-based action (Pierce, 1990). Research on critical thinking describes how individuals think about and solve complex problems. Critical thinking cuts to the heart of effective managerial work. A leader with critical thinking abilities will make better decisions and effect action of enlarged scope and heightened quality (Neumann, 1989).

Workplace Developmental Learning Events

John Dewey's (1916) early work on cognitive development suggests that challenging and/or disorienting experiences stimulate the development of thinking ability. In numerous studies of successful leaders researchers at the Center for Creative Leadership (CCL) in Greensboro, NC, have determined that developmental learning occurs primarily through work experiences, not in formal training programs, and that successful corporations emphasize job challenge for developing managers (McCall et al., 1988; McCauley, Ruderman, Ohlott, & Morrow, 1994). In fact, the "developmental potential of a work experience is driven by the challenges it presents" (McCall et al., 1988, p. 8). Successful leaders' careers are marked by a variety of specific challenging work assignments and disorienting experiences, like starting an operation from scratch, making a huge leap in scope of responsibility, or turning around a business in deep trouble. This study hypothesized that challenging workplace learning events would stimulate the development of critical thinking skills.

Adaptive Flexibility

The "high-tech" arena of the global marketplace requires that organizations be able to respond flexibly to rapid changes in conditions and circumstances. For this reason, contemporary organizations need leaders who can adapt to and learn from the challenges encountered when confronting change. In his theory of integrative development, Kolb (1984) states that the ability to respond flexibly to change has a strong influence on a person's adaptation and growth over the life span. This trait is called "adaptive flexibility." People with high degrees of adaptive flexibility are readily able to adapt their style of learning to the demands of the learning situation. An adaptively flexible

Copyright © 1999 Robert Duchesne

leader can more successfully manage in the global marketplace than a leader who is not adaptively flexible (Payne, Bettman, & Johnson, 1993).

Based upon research conducted to date, variables associated with the development of critical thinking ability in leaders are intelligence, age, years of education, and years of experience, as depicted in the unshaded portions of the "Individual Characteristics" component of the diagram in Figure 1. This research study proposes the addition of an additional individual characteristic, adaptive flexibility (Kolb, 1984).

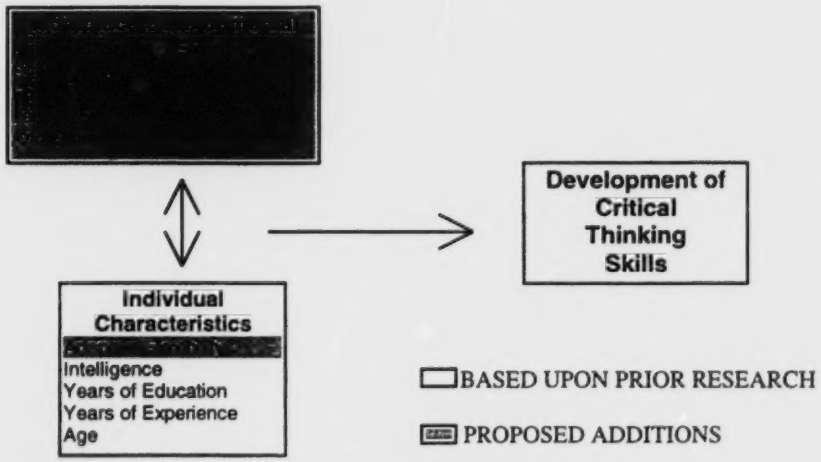

Figure 1. Framework of factors associated with critical thinking skills development.

The hypotheses tested were: 1) there will be no significant combination of independent variables: number of workplace developmental learning events, average perceived significance of workplace developmental learning events, and individual characteristics (adaptive flexibility, years of experience as a leader, years of education beyond high school, and age), that predict the level of critical thinking, 2) there will be no combination of factors that describe the workplace developmental learning events of the leaders studied, and 3) there will be no combination of workplace developmental learning factors that predict the average perceived significance of learning of the leaders studied.

Methodology

Three instruments were used to measure the study's variables. Critical thinking was measured by the Watson-Glaser Critical Thinking Appraisal (WGCTA) which consists of 80 items divided into five scales: inference, recognition of assumptions, deduction, interpretation, and evaluation of arguments (Watson & Glaser, 1980). Workplace developmental learning events were measured by an adaptation of "Section V: Your Background" of the Job Challenge Profile (McCauley, 1991) called the Experiences Checklist which measured the level of significance on a five point Likert scale of up to 43 workplace learning experiences. Adaptive Flexibility was measured using Kolb's (1980) Adaptive Style Inventory, a 48 item, forced-choice, self-report instrument consisting of four scales: concrete experience adaptive flexibility (CEAF), reflective observation adaptive flexibility (ROAF), abstract conceptualization adaptive flexibility (ACAF), and active experimentation adaptive flexibility (AEAF). A one page sheet that appeared as the cover to the Experiences Checklist assessed demographic variables. Instrument packets were distributed to 341 leaders who had attended CCL's five day Leadership Development Program during 1993; 119 leaders (35%) chose to participate in the study.

BEST COPY AVAILABLE

Results

The research sample of 119 people consisted of 88 males (74%) and 31 females (26%). The mean age of study participants was 42.9 years (SD=7.2); average number of years of education beyond high school was 5.5 years (SD=1.9); mean number of years of direct supervisory experience was 12.3 years (SD=7.1). With respect to organizational level, 25 (21%) were executive-level managers and 93 (78%) were mid-level managers. The mean critical thinking score of 67 out of 80 (SD=7.3) placed this sample at the 85th percentile compared to a national sample of sales representatives. The average participant had experienced 22 of the 43 workplace developmental learning events assessed and considered the learning from these events highly significant. The average subject was moderately adaptively flexible, yet during learning or problem solving tended to engage in less than average reflective observation. The means, standard deviations, and intercorrelations for the variables critical thinking, developmental learning, and adaptive flexibility are summarized in Table 1. The intercorrelations between these three variables were low (r=-.11 to r=.08), indicating that the three variables are independent.

Table 1.
Total Sample Means, Standard Deviations, and Intercorrelations for Instrument Scales: Watson-Glaser Critical Thinking Appraisal (WG), Experiences Checklist (EC), and Adaptive Style Inventory (ASI) (n=119)

	Mean	SD	WG	EC	ASI
Watson-Glaser Critical Thinking Appraisal[a]	67.1	7.3	–	-.07	.08
Experiences Checklist[b]	21.8	5.1		–	-.11
Adaptive Style Inventory[c]	15.9	3.9			–

[a]Possible score of 0-80. [b]Possible score of 0-43 [c]Possible score of 0-32.

Hierarchical multiple regression was used to determine the independent variables that predict critical thinking skills in the leaders studied. The analysis showed that the only significant predictor of critical thinking score was years of education beyond high school ($r = .31$, $p < .001$). The regression analysis indicated that years of education accounted for 10% of the variance in critical thinking score ($p < .001$), a small effect size.

A factor analysis procedure with oblique rotation was used to determine the combination of factors that describe the workplace developmental learning events reported by the leaders studied. The factor analysis identified six factors that describe the reported workplace developmental learning events of the leaders studied: (1) Career Crisis, (2) High Stakes, (3) Management Development Opportunities, (4) Reduction Decisions, (5) Mentor or Role Model, and (6) Discrimination. Factors 1, 2, 4, and 5 resemble factors identified in several CCL studies (Eichinger & Lombardo, 1990; McCall et al., 1988; McCauley et al., 1994). Management Development Opportunities and Discrimination are new results.

The correlation matrix of the six factor scale scores and average perceived significance of learning showed significant correlations between High Stakes and average perceived significance (r=.27, p<.01) and between Management Development Opportunities and average perceived significance (r=.56, p<.001). A stepwise multiple regression showed that Management Development Opportunities accounted for 31% of the variance in average perceived significance rating, a large effect size.

Discussion

The results of this study support the results of previous studies of learning in leaders that concluded that the most important lessons are learned from on-the-job experiences (Baldwin & Padgett, 1993). The results of this study indicate that formal education was the only variable significantly related to critical thinking. This result supports previous research studies that found critical thinking correlated with education (Pearson, 1991). Both challenging workplace experiences and adaptive flexibility were not related to critical thinking.

With the lowered levels of reflection (i.e., low ROAF scores) responses to situations and dilemmas at hand may have been "automatic," reinforcing previous learning when the potential for new learning and development existed. The Watson-Glaser concept of critical thinking is narrowly focused and restricted. Results of this study show that WGCTA critical thinking is logic-based, single-loop (Schon 1987), instrumental and weak sense (Paul, 1984) critical thinking. Schon (1987) describes critical thinking as a process whereby the individual reflects on actions and

thought processes, calling into question underlying assumptions. A closer analysis of the items on the WGCTA shows that correct answers can be determined by the rules of logic. No reflectivity is needed.

Reflective judgment is a structurally based cognitive ability based upon levels of cognitive schema (King & Kitchener, 1994). Reflective judgment ability is necessary for solving ill-structured problems, e.g., the kind of real-life problems encountered in the workplace, particularly by challenging or disorienting experiences (King & Kitchener, 1994). Measuring reflective judgment rather than critical thinking may have been more appropriate to the purposes of this study.

Piaget (1972) uses the term schema or schemata to describe the framework onto which incoming sensory data can and must fit. Schema are mental maps that enable individuals to orient themselves within their experiential terrain. As an individual has new experiences the schematic framework constantly changes through activation of the assimilative/accommodative process. In this study there was no way of testing or measuring whether the 43 workplace learning events measured on the Experiences Checklist were truly developmental. To what degree the Experiences Checklist actually measured developmental learning is uncertain.

Conclusions

The results of this study provided only partial support to the model for developing critical thinking in organizational leaders proposed in Figure 1. Results of this study suggest that the development of critical thinking is a more complex process than that illustrated in Figure 1.

Based upon the results of this study and upon a follow-up review of the literature relative the study's outcomes, a revised model was developed that more accurately depicts the developmental learning process of leaders through workplace learning experiences. The framework encompasses the development of both critical thinking and reflective judgment.

Figure 2 illustrates the revised model for critical thinking and reflective judgment development in organizational leaders. The model consists of two paths or tracks: (1) a confirmatory relearning path corroborating an existing model of meaning, and (2) a developmental learning path resulting in a revised model of meaning.

Confirmatory Relearning

The confirmatory relearning process is triggered when the leader perceives a match between the current situation and past experience. The individual responds automatically and no "new learning" takes place. This is called the conduit effect (Sheckley & Keeton, 1997). The experience is constructed as a well-structured problem. Well-structured problems can be solved using critical thinking skills (King & Kitchener, 1994) and under stressful conditions (Fiedler & Link, 1994). The confirmatory relearning process results in corroborating the existing model of meaning.

Developmental Learning

The developmental learning process is activated when the individual perceives either a partial match or a mismatch between the current situation and past experience. The hierarchical structure of the individual's "world view" or "model of meaning" is abandoned or altered in some way. The reflective system is activated and new learning takes place. This is called the accordion effect (Sheckley & Keeton, 1997). If the current problem or circumstance is viewed as novel, the leader will construct the experience as an ill-structured problem with its attendant ambiguity and uncertainty. Ill-structured problems are best solved using reflective judgment (King & Kitchener, 1994) and under conditions of low stress (Fiedler & Link, 1994). The developmental learning process results in the creation of a revised model of meaning.

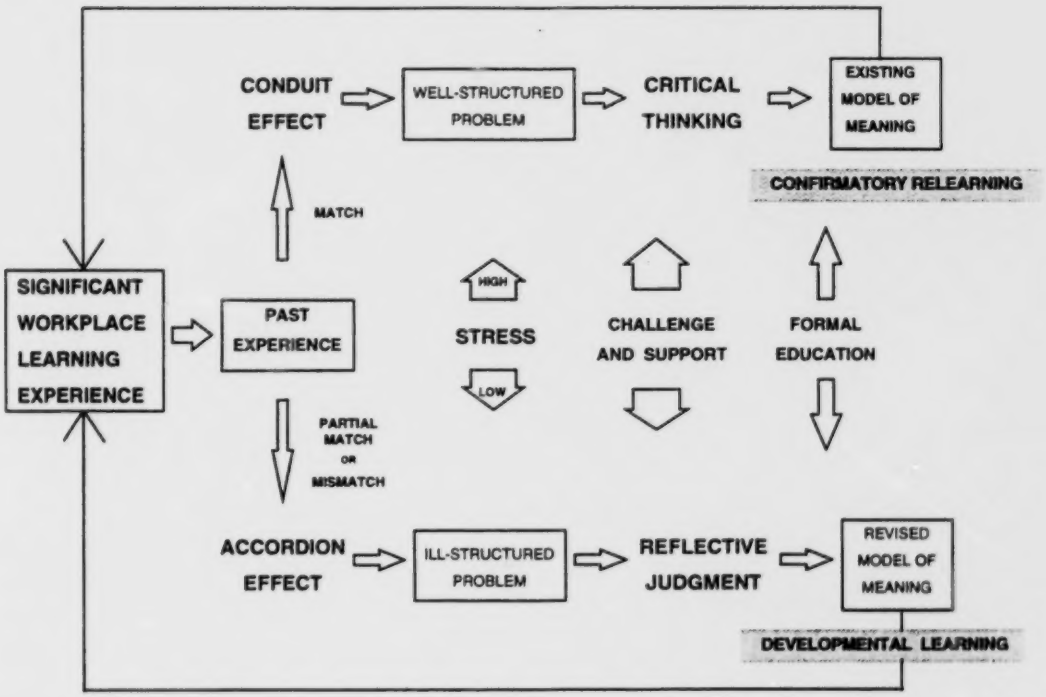

Figure 2. Revised model for critical thinking and reflective judgment development in organizational leaders.

Implications for Practice

The results of this study support the results of prior studies that concluded that significant learning for leaders comes from experience, from learning by doing the job, and from job challenges (Baldwin & Padgett, 1993; Lombardo & Eichinger, 1989; McCall et. al., 1988; McCauley, 1986; McCauley et. al., 1994). Giving challenging job assignments such as creating and managing change can create the conditions for significant learning and development.

Results of this study support Eichinger and Lombardo's (1990) contention that courses that focus on self-awareness are important to leader development. Seventy-six percent of this study's participants rated their learning from receiving feedback on their managerial style as very or extremely significant. Receiving direct feedback from peers, superiors, and subordinates can often trigger reflective learning.

Stress can negatively impact performance in leaders (Fiedler & Link, 1994). Creating a workplace culture that is supportive, is accepting of mistakes, and values well-thought-out decisions and strategies can reduce stress.

Encouraging the broader use of group discussion, reflection, and decision making can stimulate increased reflectivity in organizations, more adequate analysis of the issues, and better decisions. Also, encouraging leaders to look for the unique characteristics in a particular situation that may initially look mundane can often lead to new learning and to the choice of a more adequate course of action.

The type of reflection currently gaining popularity in organizations targets learning that results in increasingly effective action by individuals and groups. Reflection also leads to more objectivity, self-confidence, a heightened sense of personal responsibility, increased tolerance for ambiguity and paradox, the unlocking of creativity and intuition, enlightened action, and a more balanced life (Sherman, 1994). Learning to be reflective takes commitment, time, and effort. The sense of focus, clarity, contentment, and effectiveness that are demonstrated outcomes of reflectivity are worthwhile outcomes for organizational leaders to strive to achieve.

Vital Work: Spirit and Development Within the Natural Workplace

Terri A. Deems
DAI/WorkLife Design

What happens when we reframe work as a fundamental site of human development? This research explores two organizations where development becomes not a function of training but a way of conducting work as a whole. This study illuminates the lived experience of people who work within "natural" or "vital" workplaces. The educative function of the workplace is explored and principles for vital work are identified and defined.

Keywords: Organizational Development, Vital Work, Meaning-Making

Adults today spend more of their time and energy engaged in work than in any other wakeful activity; for the adult, work is the central domain for learning and for the development of our human capacity (Jarvis, 1992; Kincheloe, 1995; Watkins, 1991; Welton, 1991). Research presents a clear interrelationship between the structure of our work organizations and the psychological qualities and attitudes of the people who work within them (Balawajder & Popiolek, 1996; Mortimer, 1988; Pauchant, 1995; Riordan & Griffeth, 1995; Watkins, 1991; Williams et al, 1997); the everydayness of work serves as a context and source of learning and of self-knowledge. Work is, as Welton (1991) describes, a fundamental training site for a participatory and democratic society.

Such a perspective of the workplace moves beyond traditional ideas about the education and training of workers to enhance corporate profit. Rather, it brings us to consider the workplace itself as a curricular structure, an educative environment (Dewey, 1938) with the potential to stimulate or enhance, to restrict or distort, growth and development. Yet this educative function of work has been a largely neglected theme in the field of human resource development (HRD). In our efforts to ensure we are making "value-added" contributions to organizational performance, we risk losing sight of our field's tradition: to further the development of humans and to promote the growth and welfare of the larger society (Friedlander, 1996).

This research explores two organizations where development becomes not a function of training but a way of conducting work as a whole, and illuminates the lived experience within these environments. The educative function of the workplace is explored and principles for vital work are identified and defined.

The Organization of Work

Contemporary Workplace Reforms

We are experiencing today a pace, breadth, and depth of change unseen in any previous chapter in workplace development in the Western world. Innovations that emphasize the importance of learning and of personal and collective development can be seen in the emergence of less authoritative structures and more collaborative and democratic work processes (for example Briskin, 1996; Dew, 1997; Dirkx, 1996; Kofman & Senge, 1993; Marsick, 1987). Such efforts to reinvent the corporation depict a struggle to establish a vision of work founded on a more clearly articulated set of humanistic values and constructivist models (Aktouf, 1992; Dew, 1997; Dirkx, 1996; Meltzer & Wickert, 1976): shared rather than unilateral power; autonomous work groups; diversity rather than conformity. Within the margins of such change lies an implicit recognition of the interrelationship of the subjective life of the worker and the objective conditions of work (Aktouf, 1992; Watkins, 1991; Welton, 1991). Yet in spite of new reforms, technical-rational approaches to work continue to be the norm and reforms retain a distinct positivist flavor (Ketchum & Trist, 1992; Kincheloe, 1995; Pauchant, 1995). Reforms are appropriated or sanctioned in order to enhance worker quality, commitment, productivity, or morale. The extent to which such reforms add value to the organization is embedded almost exclusively within a capitalistic framework (Briskin, 1996; Dirkx, 1996; Morin, 1995). Contradictions and paradox exist. With increased democracy, there are increased surveillance technologies. With open sharing of information, heated debate over office Internet access. With increased participation, restrictions on cubicle "prairie-dogging."

The worker continues to be conceptualized as an object ruled by causes, whose subjective experience is separated from the objective conditions of the workplace (Watkins, 1991). Research indicates that such a fragmentation results in an experience of work which constricts and distorts, rather than enhances and enlarges the human spirit (Aktouf, 1992; Watkins, 1991; Welton, 1991). This constitutes a miseducative experience (Dewey, 1938), a "false and stunted humanism" (Aktouf, 1992, p. 412). The centrality of work in our lives is generally

Copyright© 1999 Terri A. Deems

relegated to work's role in creating a preferred lifestyle and there is little regard or consideration for how people develop, what people learn, what they come to know, outside the confines of sanctioned training.

The Natural Workplace

Reframing work calls for more than innovative strategies subtly inserted within the Taylorist paradigm (Aktouf, 1992; Block, 1997). It calls for deeper questions concerning our assumptions about the nature of work, how work is structured and organized, even the very purpose and meaning of work itself. In contrast to contemporary reforms, a "natural," more fully human workplace is emerging that ceases to artificially create, manage, appropriate or control the experiences of others (Aktouf, 1992; Semler, 1993). Grounded in a developmental view of work, the natural workplace appears to restructure the workplace around fundamentally different social, psychological, and economic assumptions. Named as radically humanist, democratic, mindful, conscious, even spiritual or soulful, this way of work is conceptualized as passionate, creative, nurturing, socially just, and more fully human, where profit and market share become not the goal but the by-product of vital or right work (for example Adams, 1984; Aktouf, 1992; Briskin, 1996; Clark, 1967; Dew, 1997; Dirkx & Deems, 1996; Fox, 1994; Hawley, 1993; Kofman & Senge, 1993; Meltzer & Wickert, 1976; Wenger, 1996; Whyte, 1994).

This sense of a more authentic, more fully human workplace appears to be qualitatively different than many other workplace reforms. The natural workplace is grounded in a particular view of human nature, a view supported within diverse bodies of literature (for example Aktouf, 1992; Dewey, 1938; Egan, 1994; Fox, 1994; Handy, 1994; Hawley, 1993; Jarvis, 1992; Kincheloe, 1995; Kofman & Senge, 1993; Moore, 1991; Pauchant, 1995; Wilber, 1995; Whyte, 1994). Primary to this view are the ideas that humans are (a) endowed with consciousness, right judgment, and free will -- we are actively involved in our own becoming; (b) fundamentally defined by our community and relations with others; (c) innately drive towards development and transcendence; and (d) share a common need for partnership and connectedness, for self-expression, and for meaning and purpose. Natural workplaces appear to structure and organize work in a way that facilitates the expression of this nature.

A growing body of literature (for example Bolman & Deal, 1995; Briskin, 1996; Fox, 1994; Hawley, 1993; Kofman & Senge, 1993; Whyte, 1994) presents an impressive picture of how work might be experienced within such environments: as vital, nurturing the human quest to embrace life fully with animation, meaningfulness, and purpose. Most of this work, however, consists of anecdotal evidence from proud CEOs (for example Fishman, 1996; Melrose, 1995; Semler, 1993). A relatively small body of ethnographic or anthropological research into more humanized workplaces or work units (for example Balawajder & Popiolek, 1996; James, James & Ashe, 1990; Massarik, 1976; Riordan & Griffeth, 1995; Schneider, 1990) describe a culture of work that embraces highly self-directed, participatory practices, community building, opportunities for friendship, recognized contributions, trust, and respect for humanity. They depict a strong corporate consciousness manifest by organizational members' engagement in the active processing of information, awareness of individual and collective strengths and weaknesses, awareness of the full environment in which the organization exists, and awareness of the interdependency of its systems (for example Massarik, 1976).

The idea of the natural workplace has been developed conceptually by numerous scholars, and the testimony of organizational leaders presents a rich and thought-provoking picture of what work might be. Within existing representations, however, there is a continued emphasis on the *perception* of work rather than on the *experience* of work (Briskin, 1996). There remains a distinct lack of research which presents the lived experience of workers within these sites, and we can only speculate on the extent to which people themselves experience these workplaces in an educative way. The purpose of this study is to explore how people experience and make meaning of the natural workplace, to build on our understanding of the qualities and characteristics of such an environment, and to investigate ways in which the natural workplace may contribute to growth and development.

Research Questions and Significance to HRD

This study explores the lived experience of people within two organizations working to create more humanistic, natural workplaces. It focuses on the nature of work and how people experience and make meaning of work within these environments. The following questions guided this inquiry:

1) How do workers experience and make meaning of organizational life within the natural workplace?
2) How is the natural workplace structured and organized? What are the qualities and characteristics of such an environment?

3) How and what do people learn, of themselves and of others, within the natural workplace? In what ways does the natural workplace facilitate growth and development of the individual and group?

Significance of the Research Problem

Argyris (1976, p. 405) described, "If the validity of the concept of the organization is to survive, the new designs will have to raise the level of the quality of life within the system and genuinely value high-quality living as much as efficiency." Conceptualizing the workplace as a fundamental site of learning and development offers this opportunity by creating experiences where "the purposes, driving forces, culture, behavior standards and results are more closely aligned to human needs, aspirations, and potential" (Koch & Godden, 1996, p. 173). An on-going and direct concern of organizational leaders lies with the objective conditions within the workplace in which interactions take place. Growing interest in such concepts as quality of work life, organizational learning and transformation, and work as vocation or calling, demonstrate a new focus on the establishment of working conditions that will "awaken in the worker the desire to work together in a spirit of community, creative energy, and meaningful purpose" (Aktouf, 1992, p. 419). The human spirit at work may be understood less as an object to be improved and much more as a force for collective creativity and innovation.

Human resource development practitioners are called to look more deeply into the ways in which the environment nurtures experiences that lead to growth, and how to utilize the physical and social environments "so as to extract from them all that they have to contribute to building up experiences that are worth while" (Dewey, 1938, p. 40). There is little agreement, however, as to what this means in a real and concrete way. This study contributes to our understanding of the workplace as a site for personal and organizational development, and illuminates conditions of work which are most conducive to a vital workforce. Developmental aspects of work will enhance our knowledge base of learning in terms of sociocultural, tacit, and self-knowledge. This study also contributes to our understanding of adult learning within the context of work as informal and incidental.

Research Methods

To understand another's experience, and to gain insights into the context which surrounds this experience, is to understand how a person makes meaning of a phenomenon. Meaning-making is the interpretive aspect of cognition and perceptions and, by definition, it is phenomenological (James, James & Ashe, 1990, p. 42). This study is grounded in Husserl's concept of phenomenology (as in Holstein & Gubrium, 1994; Moustakas, 1994; Sinha, 1969) a method that allows us to understand the ways the experiential world is produced and experienced by its members (Holstein & Gubrium, 1994).

Two midwest organizations participated in this study, having met the criteria for working towards a more natural work environment. This criteria were established based on a review of literature concerned with humanizing work environments (for example Fox, 1994; Hawley, 1993; Pauchant, 1995), and included:

- high levels of autonomy (e.g., use of participatory and democratic work processes, lack of dress code, and the commitment of the organization to an individual's personal goals);
- tolerance for ambiguity (e.g., lack of an employee handbook or task-specific job descriptions);
- relatively high levels of trust (e.g., lack of detailed policy and procedures, open leave policies, self-reporting time records, or full disclosure of financial information concerning organizational status);
- non-competitive recognition of employee contributions such as profit sharing plans maintained by employees;
- evidence of concern for the "whole" person (e.g., health/wellness facilities or programs, encouragement of educational development, social activities, or flexible time-off policies); and
- minimal hierarchical structure and evidence of individual power based on earnings or job title (e.g., office space determined by need rather than level of position, lack of reserved parking spaces, or open access to designated organizational leaders).

From these sites 20 self-selected people, representing a diverse mix of age, educational levels, gender, and positions within the organizations, participated as co-researchers. Data was collected through multiple methods including non-participant observation, document review, focus groups, unstructured field interviews, semi-structured interviews, and follow-up interviews. Information was recorded with the use of detailed field notes and audiorecordings. The participants/co-researchers also participated in the analysis and the writing of the findings through member checks and providing feedback to the primary researcher on the written narrative.

Data analysis consisted of three major stages (Moustakas, 1994): phenomenological reduction, imaginative variation, and synthesis of meanings and essences. Audiorecordings were transcribed verbatim and each transcript underwent a process of horizonalization, establishing meaning units and themes, development of individual textural and structural descriptions, and the synthesis of meanings and essences across cases. From this synthesis a composite textural-structural description was constructed, representing the shared essence of the work experience. The composite descriptions were presented to participants to ensure they represented an accurate and rich portrayal of their experiences and meaning-making within their workplaces. Accuracy and trustworthiness of the data (Lincoln & Guba, 1985) was ensured through on-going contact with participants, triangulation of data, member reviews, and peer review.

Findings: The Experience of Work

Findings reveal these more natural workplaces as relatively unstructured, with open books and open systems of communication, fluid work groups, high levels of autonomy, ample opportunities for friendship, and de-structured work processes. Being here is "vital" and animating involving a pace that is both draining and energizing, and filled with contradiction and paradox, conflict and uncertainty, high emotion and "fun." Participants structure the experience of work in five universal ways, described in their own words below: Self and Self-Other Relationships, Connectedness and Relatedness, The Role of Past Experience, Individual Differences, and Meaning in Work.

Participants fill their days with activity which moves them and the organization forward. The days are both "too long" and "not long enough." When the roller-coaster is in motion, people are tired and supportive, teasing and resentful, hopeful and frustrated, excited and angry. "Fully alive." Pushing to be their best often demands that all their energies be directed towards a narrowly-defined product goal, subordinating equally important objectives and desires. It's frustrating. Work is depleting, yet somehow adds "life to the hours" both at home and at work. Work requires continual negotiation between both outward and inward projections: fulfilling your own needs in the challenge to learn more, do more, be "better" than last time, sometimes clashes with specific organizational needs and interests; personal time sometimes clashes with the need for overtime to complete a project or shipment date. A deep sense of safety comes in knowing that you are trusted, in conjunction with a darker sense of doubt in knowing that you are solely accountable within that trust.

Self in relation to others involves demands, interruptions, arguments. There is a sense that "I can be myself" in the midst of others, having no need to justify actions or to remain on guard lest someone misinterpret our actions. Interacting with others--in play, in dialogue, even in conflict--serves a generative function in the creation of new ideas and suggestions, new perceptions of others, and new perceptions of self. Within this environment, it is with great difficulty that people talk only of "I." Rather, it is "our" work, "our company," "our" project. This collective orientation frequently runs up against the personal valuing and significance of choice and autonomy at work.

The structures, processes, management, and directives of work--both explicit and implicit--make up a web connecting people, job tasks, goals, and meaning. Respect is a key foundation--respect for one's views and variations, for how you express yourself through your work, and for how you relate with others. This respect leads to the creation of work processes which encourage dialogue and innovation. To exclude someone from full participation within the workplace is an expression of disrespect or of "not recognizing humanity": not listening, not involving, not engaging, not making eye contact, making decisions which affect a work group without their input and insights, responding to one's ideas with ridicule, sarcasm, or silence. Inclusion demands participation and voice, which constitute "being a person" at work. Only through such participation and interaction will product quality be assured and improved, a sense of purposeful work be created, and interest and energy maintained.

As participants describe, respect is closely related to trust, because "when you respect another, you see your common humanity"--you see yourself within them. This implies high levels of trust from the first moment of relationship, given freely rather than following a testing period, trust which is maintained until actions occur which prove misplacement. "Empowerment" is a part of the human condition, rather than something that is granted or bestowed. Such trust is incompatible with tight controls, and implies such conditions as the personal use of company equipment, elastic timeframes for work, even the willingness to have others laugh with you at your own mistakes and trust they have no hurtful intent. As one leader described, trust is the belief "that people want to perform at their peak," then providing what they need and getting out of the way so they can do so.

With trust comes responsibility: the group is responsible for the project, the person for their work, the company for the person. Connected to responsibility is a strong sense of both personal and collective accountability. When you hold the responsibility, you are accountable for the decisions you make, the work performed, the hours claimed, the copies made. Accountability recognizes, however, that outcomes are not always a matter of individual

performance but the result of factors outside our control. The need for close interaction with others becomes necessary then, in order to support conditions which make accountability, responsibility, and understanding and empathy, realistic conditions of work.

Joking with co-workers, talking with the boss, examining a part, or taking time off to run the car into the garage become significant activities when framed against previous work experiences and our prior sense of what work is. Guilt lingers at times, "old tapes" claiming we should be more productive, or suggesting that people are watching, whispering, when we arrive for work 15 minutes late or leave a few moments early. Hesitantly, we sit for the first time among a work group, listening to heated debate and struggling to express our own ideas when that has never been invited until now. Escaping past bonds demands learning: learning to participate, learning to trust your instincts and judgment, learning to fight it out within the project room and still remain friends afterwards. The past loosens its hold as we come to know that we are valued and important here, that people will listen to our ideas. The construction of new meaning can be filled with frustration, though, and we sometimes insist on imposing the structures we are most used to as a way of confronting and overcoming the uncertainties before us.

A wide range of individual differences seem to influence the experience and meaning of work. Some people described a childhood upbringing they believed impacted their comfort or discomfort with their present workplace. Instincts for taking action may influence our sense of whether a system is too rigid or not rigid enough, provides too much structure or is chaotic, is safe or threatening. Other participants suggested age as a critical feature: younger workers believed their young age made them more flexible, adaptable, able to interact more authentically with others; older workers believed these same characteristics were attributed to their greater maturity and experience within the workplace. Individual differences, though frustrating at times, also serve to create a culture and work climate that are filled with the noise of life, the full range of sounds that accompany celebration and anger, joy and conflict, work and play. Some suggested it is the absence of such noise that reflects the more oppressive, restrictive work environment.

Within our society, the meaning of work will perhaps always be somehow connected with our ability to create and maintain a lifestyle. Yet within this environment there lie more fundamental meanings as well. According to these participants, work constitutes how we care for others and how we contribute to their lives. "It's a reason to create." Work means personal growth through the daily struggles and challenges, through expressive activity, and an ever-broadening perception of our presence in the world. It means the "thrill" and pride in "seeing something come from nothing," or in "pushing myself to do what I did not believe I could do." The experience of trust, responsibility, being connected with others, and recognition help to create meanings of value and of the awareness of one another's essential humanity. In the past, when these have been absent, participants present a reliance on financial outcomes to define meaning within work. While the material rewards as a meaning for work remain for all people, they increasingly dim as we engage more closely with others in purposeful work.

Discussion of Findings

Participatory or democratic social arrangements are more likely to result in experiences which arouse curiosity and strengthen initiative (Dewey, 1938), necessary conditions for continuous improvement. The natural workplace expresses its educative potential through interaction with others, structures and systems for communication which demand interpersonal competence and dialogue, movement from self-protective to ever-increasing autonomy, and the encouragement of postformal thought through processes which compel complex means of problem-solving. The "dark side" of work is balanced in part by ample opportunities for informal relationships which provide opportunities to re-energize and rejuvenate from the complexities present within the workplace. Participants indicated that interaction with others, and the nature of relationships which developed, affected not only the quality of the work but also one's sense of self. Cognitive development accompanies increases in social-cognitive experience as people are challenged to reflect on their beliefs or behaviors, to debate and dialogue, and to approach their work more critically (Sinnott, 1993). Increasingly complex ways of solving problems develop with social experience and encourage critical and postformal thought (1993).

The vital workplace depicts an organizational consciousness which values mindfulness--the active processing of information, differentiation, and always-present awareness of context. Langer (1989) proposes that human potential can be expanded through processes which demand an active rather than passive experience of work, cultivating individuals who continually create new challenges for themselves. Organizational goals are achieved by people who are originators rather than pawns, and expressive creativity encourages innovation rather than conformity and satisfaction with the status quo. Organizational leaders play a key role in removing barriers and developing mindfulness -- not by way of control and power but in terms of de-structuring work and the persistent and careful attention toward what will be of most use to the workers.

The idea of partnership, of interconnectedness, of holism, within the workplace leads us to appreciate that we are not separate from the world but a necessary and vital part of it. This interconnectedness, however, can and often does arouse conflict and contradiction. Rather than working to alleviate such uncomfortable conditions, leaders recognize that the tensions created can serve as originators of growth and development, opening avenues for new learning about self, about others, and about being a part of the work community. The natural workplace is as full of frustration as it is of joy, of angry emotion as it is compassion, of unpredictability as it is trust, of conflict as it is of happy and satisfied people. It seems to embrace all expressions of human nature, and values them each as sources of human animation and meaning. People, as one participant described, "live loudly" in their shared pursuit of business profits, relationships with others, and meaningful work.

Cultivating Vital Work: Implications for HRD

Participating workplace leaders involved in this study support the idea that *how* vital work evolves follows no set formula; there is no clear prescription of "steps" to take nor a clear point indicating when an organization has "become" a vital workplace. It is an on-going process of unfolding and learning; reframing organizations as sites for adult development begins not with a prescribed formula but with critical assumptions (see for example Aktouf, 1992; Bolman & Deal, 1995; Briskin, 1996; Dirkx, 1996; Welton, 1991) of human nature: that people are active constructors, not pawns, within the workplace; that we carry in us an innate drive to create something larger than ourselves; and that we are naturally motivated and empowered. When these are not expressed in our work it is less due to a deficit people hold but because of barriers embedded within the work context or our past experience. The findings of this study support the anecdotal evidence, prior research, and theory of the relationship between work and learning in suggesting central principles for HRD and the cultivation of the natural or vital workplace. These principles guide the concrete ways in which work is structured and conducted. While these principles are not necessarily exhaustive, they do present an experience of work which focuses on a way of being and becoming, on presence rather than appearance.

Solidarity. It is imperative that people within the workplace be seen as active and willing participants rather than as instruments of production. We must abandon management based on authority and in its place create opportunities which nurture people's natural desire to belong, to contribute, and to engage in meaningful work. Managers are not "artisans of liberation;" rather, a culture of convergence and sharing must be inserted into actual practice where people act on their intentions through reasons, feelings, and choices rather than by "causes." Only then will we recognize a unity and quality of worklife based on community of interests, objectives, and standards.

Engagement. Participatory and self-directing work processes provide the necessary opportunities for development through autonomy, relationship, and engagement with others. This participation, however, must be unrestrained by channels of command and mechanisms of control. Rather than simply a symbolic participation, people must participate in a real way with the sharing of profits, power, property, and decisions. The *perception alone* of autonomy, of being valued, and of participation will not sustain the more humanized workplace. It must, as Aktouf (1992) describes, be a lived rather than appropriated experience, one which holds the human actor in high regard in an authentic way. We also know we cannot engage people simply by asking them to participate; based on prior experience, many people will have to learn what it means to participate. The quality of engagement within the workplace is enhanced when leaders foster dialogue, authentic relations, and reflection by modeling these behaviors, challenging people, asking questions, and offering opinion over directive. Dialogue and reflection are sustained when people can see positive outcomes from these exchanges--when they see their voices are heard, their questions answered, their ideas considered, when information is freely shared, and when understanding is viewed as an important part of work. People's sense of business literacy will be enhanced through the free sharing of information and business problems concerning all aspects of the business--hiring, orienting new workers, sharing in the evaluations of work completed, regular information concerning the company's financial performance. Engagement also demands recognition of people's contributions in order to sustain their efforts and energies. Just as critical are opportunities to come together in informal ways which help cultivate a sense of solidarity and engagement with others: common eating or other socializing areas, company-wide events held, and organization-wide communication must be emphasized. These serve to enhance a real and meaningful sense of unity and connectedness.

Mindfulness. It is critical that an organization become willing and able to reflect on itself, to critique and question its own work relations, and to cultivate a more mindful or conscious orientation to the full environment in which it operates. Growth and development are fluid constructs, and there is never a point where either an individual or an organization has "made it" to a definitive evolutionary end. This more conscious and critical

perspective provides the means for increasing both personal and collective capacity, to expand identity and embrace a larger view of ourselves in the world.

Connectedness. A greater sense of holism, of connectedness and interconnectedness, must be recognized as it pertains to the worker and the product, the person and the environment -- we must view work in its full complexity and multidimensional character. This includes, for example, the relation between language, meaning, and work, and the relationship between communication, information-sharing, and a person's ability to contribute in a meaningful way. Conflict and contradiction are inherent components of connectedness. Rather than rushing in to "fix" problems, to ease tempers, or to speed production, organizational leaders are instead compelled to prod and push, to challenge people towards resolution. In this way, "problems" become forces for learning and innovation. For this to happen, however, leaders must reframe their sense of "resistance," and be willing to sit with the tensions created rather than jumping in to resolve problems themselves. This holding of the tensions encourages people to break out of their comfort zones, to think more critically, and to transcend rather than concede.

Meaningful Purpose. Finally, the purpose of work based strictly on economic assumptions must be challenged. Where more traditional workplaces and many workplace reforms focus on profit and consumption as primary goals, the vital workplace understands these as natural byproducts of a more humanized environment and as a means to contribute to a greater cause. Work is not simply about money, but about satisfying our need for expression, innovation, community, and purpose. When we acknowledge the full function of work in our lives, we cannot help but begin to reshape our organizations. Begin by asking, If profits are important for us to survive as a company, why is that survival important? To what end are we, as a company, truly working? And then, How can we best reflect this focus in the ways in which we conduct work?

Conclusion

Reforms that are targeted to change the behavior of others are not reforms at all (Aktouf, 1992; Block, 1997). Such reforms oversimplify human nature and depict the worker as an object rather than as subjects in their own right. By continuing to objectify the human at work, we relegate development to that which happens only when authorized by someone else, embedded within traditional structures of power and control. This ideology fosters a narrow and restrictive growth -- a miseducative experience -- in both the individual and the organization (Dewey, 1938; Welton, 1991) because it fails to acknowledge the complex relationship between individual experience and the full organizational context.

In contrast, this study suggests the natural workplace holds a greater educative potential. This study suggests that by de-structuring work and through the manifest valuing of the whole person within the organization, the natural workplace removes the barriers which serve to restrict and distort growth. Real and fundamental change within the workplace evolves through dynamic and contradictory means, where development is not a function of training but a way of thinking about and conducting work as a whole. This study reveals characteristics of educative work environments which return the person at work to that of a subject who acts upon his or her world. Such a workplace is not a utopia; it demands of people greater flexibility, the development of new skills, and a high tolerance for conflict and ambiguity. Fortunately, these environments provide the necessary context and opportunities for developing these qualities.

Reorienting the Theoretical Foundations of Human Resource Development: Building a Sustainable Profession and Society

Tim Hatcher
University of Louisville

The relationship between theory and practice and societal outcomes of human resource development (HRD) had not been discussed or critiqued. The underlying theories of HRD have changed in the past three decades yet such changes have not been addressed in HRD research literature. The theoretical disciplines of economics, general systems, sociology, psychology, and ethics are examined in terms of their currency to HRD and the extent that they influence societal outcomes.

Keywords: HRD Profession, Sustainability, Social Outcomes

There is a deficiency of related literature on the relationship between theory and practice and societal outcomes of human resource development (HRD). Not since the early 1990s have the theoretical foundations of human resource development been discussed or critiqued with any constancy or depth in the research literature and no publications were located that discussed the relationship between theory and practice and outcomes of HRD. Yet, the theoretical foundations are "the intellectual underpinnings of the profession (Chalofsky, 1992, p.181), and "research efforts must continually be guided by underlying theory" (Jacobs, 1990, p.70). Kaufman (1990) proposed that outcomes must be focused not solely on short-term economic outcomes, but on adding value to society.

Problem statement and theoretical framework

The relationship between HRD theory, practice, and outcomes remains controversial and ambiguous. While the relationship of theory and practice has generated moderate discussion (Swanson & Holton, 1997), inadequate attention in related literature has been given to the relationship between theory and practice and outcomes of HRD, especially societal outcomes, i.e., beyond individual, process, and organizational outcomes.

It is axiomatic that the outcomes or results of the efforts of human resource development are ideologically intended to add value to individuals, processes, and organizations. But to what attained purpose? The results of HRD should be expected not only of individuals and organizations, but also of society. Human resource development as a profession should address both the economic bottom line that addresses short-term outputs and profits and the societal bottom line that focuses on societal value added (Kaufman, Watkins, Triner, & Smith, 1998). In addition, HRD theory and practice that is counter to societal value-added and ineffective in promoting the sustainability of society and HRD as a profession should be challenged. This conceptual analysis examines how HRD's theoretical foundations have changed and how such changes may affect the sustainability of HRD as a profession and outcomes at the societal level.

Methodology

The methodology used was a conceptual analysis based on a review of related HRD and performance improvement (PI) literature. I reviewed empirical and conceptual studies published between the early 1970's and the present. In addition, I reviewed practitioner-based literature such as texts and magazines. The review included human resource development related topics such as training and performance improvement and theoretical framework, theoretical disciplines, and other theory-related topics.

Few references were found on the theoretical foundations of HRD and no references were located on how changes in theoretical disciplines have influenced HRD. Within the HRD and PI related literature only Kaufman (1997), Kaufman, Watkins, Triner, and Smith (1998), and Hatcher (1997a; 1997b) focused on the relationship between HRD/PI and social responsibility or societal impact.

Results

Several disciplines have been identified as contributing to the knowledge base of HRD, namely education, systems theory, economics, learning, psychology, sociology, organizational behavior, anthropology, performance improvement, and management science (Chalofsky & Lincoln, 1983; Jacobs, 1990; Weinberger, 1998).

Passmore (1996), reflecting on the earlier work of Swanson (1994), said there were three disciplinary bases suggested as the foundation of HRD: economics, general systems theory, and psychology. Ruona and Swanson (1998) recently added ethics as a mediator of HRD theoretical foundations. Jacobs (1990) concluded that although various bodies of knowledge had influenced HRD, HRD should focus on the *social* and *economic* benefits of HRD and the contributing areas should be reviewed and analyzed.

Although there seems to be general agreement that HRD is an interdisciplinary body of knowledge, there is no agreement as to what part of this body of knowledge should be considered as essential for HRD professionals (Jacobs, 1990). "Existing knowledge derived from the various contributing areas should be reviewed and analyzed to reveal gaps in knowledge and direct HRD research efforts in a more systematic manner, using theories unique to HRD as the organizing principles"(Jacobs, 1990, p.70).

The disciplines of economics, general systems, sociology, psychology, and ethics are reviewed herein. These first four disciplines are consistently identified as theoretical foundations in the HRD-related literature, and ethics is the most current addition. Each of the five disciplines is discussed in two ways. First, how the discipline has been generally interpreted; and second, a contemporary interpretation of how the discipline has evolved and changed. Additionally, each discipline is discussed in light of its influence as a theoretical foundation on the societal outcomes of HRD.

Economic Theories

Prior to and immediately after World War II economic theory was dominated by fiscal and monetary policy (Rothwell & Sredl, 1990). In the 1960s, human capital theory which regarded labor as a form of capital became a major force in economic theory. Until recently, human capital theory as a subset of capitalism served as the dominant neoclassical economic theory influencing HRD.

The current focus on the technological aspects of economics at the expense of human and social issues is exposing the downside of dominate neoclassical economic theory. The neoclassical economic paradigm is considered to be an explanation of the capitalist system and to a lesser degree the human capital school of economics and suggests that "starting from zero consumption, people will strive to consume goods and services without limit (Burk, 1994, p. 315). Orthodox economic models fall short when addressing systemic social and global environmental dilemmas. "Long-term results cannot be achieved by piling short-term results on short-term results (Drucker, 1994, p.80). Thus, there is an urgent need for more holistic, ethical value systems and sustainable economic theories and models, which influence the theory and practice of human resource development at the societal level.

Sustainability is a state where the demands placed upon society and the environment by organizations and the economy are met without reducing the capacity of the environment to produce for future generations. Traditional economics is based on the notion of economic *growth*, which is an increase in quantity that cannot be sustained indefinitely on a finite planet. Conversely, economic *development* focuses on quality of life without causing an increase in the quantity of resources consumed, and may be sustainable.

Although efforts exist to construct alternative economic paradigms, the impact of neoclassical economic theory has not changed substantially in the waning years of the twentieth century. One of the most well–known contemporary socio-economic theories is post-capitalism. In post-capitalist society knowledge is capital. The "factor of production is now neither capital nor land nor labor. It is knowledge" (Drucker, 1994, p.6). Thus, knowledge work that produces few issues around consumption or social or environmental degradation adds worth to organizations, the economy, and society.

Another contemporary paradigm is environmental economics, a "transdisciplinary" field of study that addresses the relationships between ecosystems and economic systems in the broadest sense. These relationships are central to many of humanity's current problems and to building a sustainable future but are not well covered by any existing scientific discipline. A modest example is industrial parks where resources such as energy and wastes are shared or recycled from one company to another.

More socially responsive models must replace economic theories that do not enhance a sustainable society or environment. Business, and HRD as a sub-set of business, is increasingly being viewed not only in terms of changing economics, but as a social institution with moral obligations to the ecosystem, the community, and society.

Due to an emphasis on humanity and personal and community development, contemporary economic theories such as post-capitalism and ecological economics provide HRD an opportunity to reconceptualize its role and function within organizations and as a field of study. Understanding new economic theories dedicated to building organizations dedicated to a "sense of purpose, not just more" (Stead & Stead, 1996, p.117) may result in a leadership role for HRD in interpretation and operationalization of new economic theories that enhance the HRD profession and society.

Systems Theories

Systems thinking as an HRD theoretical framework offers (a) understanding of social entities in which HRD functions, (b) enriching of the discipline of HRD, and (c) advancing the futures of organizations (Ruona & Swanson, 1998, p.21). However, recent concerns with the relationship between organizations and social and environmental degradation important to human resource development have illuminated the relevance of related and contemporary general systems theories of *autopoiesis* or self-regulating systems, *deep ecology* (Capra, 1996), and the *Gaia* hypothesis. Each contemporary systems theory is briefly discussed.

Autopoiesis, also known as self-regulating or self-producing systems, is concerned with the fact that all living systems are organized in a closed circular. Luhmann (1990) developed a concept of social autopoiesis as a process or network of communication. Since social systems are language-bound, i.e., symbolic, they are self-produced by non-physical boundaries of expectations, loyalty, confidentiality, and so on (Capra, 1996).

Deep ecology is a broad-based, holistic worldview; a way of seeing the world as an integrated whole rather than a detached collection of parts. "Deep ecological awareness recognizes the fundamental interdependence of all phenomena and the fact that, as individuals and societies, we are all embedded in (and ultimately dependent on) the cyclical processes of nature" (Capra, 1996, p.6).

Perhaps the most comprehensive and fascinating example of systems theory is Gaia, the notion that the planet Earth is a living system. Gaia is an ancient and organic, Mother-Earth metaphor, taken from the process of life; mechanistic thinking depends on metaphors drawn from man-made machines.

Systems theories are evolving from a mechanistic general systems theory to the organismic philosophy of Gaia. Mechanistic science rejects the idea that Gaia is alive, yet many scientists believe that morphogenesis, instinctive behavior, learning, and memory are still among the unsolved problems of biology, and the nature of life itself remains an open question. Unlike scientific systems thinking, Gaia reflects the fact that humankind's actions cannot be separated from the Earth, and like the Great Mother of ancient mythology, that Earth has a reciprocal aspect that cannot be ignored.

It is hard to ascertain the true extent of the influence of such a ubiquitous theoretical construct as general systems theory, and it is most difficult within an interdisciplinary field of study such as HRD. Since HRD efforts are carried out within organizations, the field is most influenced by theories that help us comprehend and understand human nature, organizations, and work. General systems theories also help us understand process and the interconnectedness of people, organizations, and society.

The theoretical foundations of HRD can positively influence society through our organizations only if more influential organizational members become moral agents armed with ways and means to ensure long term economic and social sustainability. Human resource development professionals contribute strategies such as systems thinking which can play a primary and pivotal role in enhancing the social performance of today's organizations (Hatcher, 1997b).

Psychological Theories

One of the most influential psychological theories applicable to HRD is behaviorism. Stimulus-response theories instruct the professional to identify and analyze stimuli within a system that may affect performance, responses that are emitted, and the consequences of those in order to uncover root causes of performance problems. Gestalt psychology also contributed to learning theory by adding the notions that patterns, relationships, and understanding of the whole are important in pattern recognition and perception.

There were also contributions of early cognitive psychologists experimenting with ways to enhance learning. Bloom's taxonomy and Gagne's conditions of learning are examples of cognitive theory linking learning to instruction. Cognitive learning theories like all learning and behavior theories have developed and evolved over the quarter century since the birth of HRD and are achieving notoriety in current HRD and PI literature.

More contemporary cognitive theories related to learning and HRD include transfer of knowledge from training to the job, motivation theories, and metacognition. Currently, the combination of social learning and cognitive psychology or social psychology has resulted in several theories such as situated learning and cognitive apprenticeships that are having an impact on learning and cognition applicable to HRD.

Unique psychological theories such as ecopsychology, the combination of psychology and ecology that focuses on the emotional bond between human beings and the natural environment out of which we evolve are beginning to emerge and influence social science disciplines. As economic theories such as environmental economics that address ecological concerns evolve, so to will psychological theories like ecopsychology.

Psychology being the study of human cognitive and affective development and processes places it squarely in the forefront of the theoretical foundations of HRD. Psychology has contributed much of what we know about how people learn and function within organizational environments. However, this central focus on the individual has drawn criticism. Psychology as an HRD discipline is myopic in failing to address individuals within contexts such as groups, organizations, and societies. Its relevance to HRD societal outcomes has been markedly limited. Changes in psychological theories will challenge HRD researchers to use alternative psychological assumptions as theoretical frameworks, and to reconceptualize the impact that psychology has on HRD outcomes at the societal level.

Sociological Theories

Like psychology, much of HRD practice and research is based upon various and divergent sociological theories. "Much of what is known about organizational culture and socialization...stems from sociological theory" (Rothwell & Sredl, 1992, p.60). Several existing and emerging sociological theories that may influence HRD are discussed.

The sociological theory of functionalism may be defined as the analysis of social and cultural phenomena in terms of the functions they perform in a social and cultural system. A concept of functionalism that influences HRD is the functional-dysfunctional continuum. Generally, when a subsystem supports the system it is functional. When a subsystem hinders the overall operation of a system, it is considered dysfunctional. This is important to HRD because it helps explain efficiency and effectiveness of subsystems to the larger system.

The major alternative to functionalism is conflict theory. Where functionalists see interdependence and unity in society, conflict theorists see an arena in which groups fight for power, and the control of conflict simply means that one group suppresses its rivals. Here power is the core of social relationships. In most modern organizations and especially bureaucracies and those that are hierarchical, conflict theory is most useful in explaining relationships.

Unlike functionalism and conflict theories that focus on systems, organizations, and society, symbolic interactionism focuses on the interaction of an individual's internal thoughts and emotions and external social behavior. Here, individuals construct their own conduct through symbols that guide their decision making and forming of opinions. Unlike functionalists, who see people as passive agents, symbolic interationists view individuals as self-interacting and not dependent on social, cultural, or psychological variables to determine action. Symbolic interactionism is a framework for qualitative methodologies used in much of HRD research.

Compared to other sociological theories, phenomenology is more recent and somewhat more difficult to define and describe. In phenomenology, the individual avoids all prior assumptions, biases, and dogmas and thus examines phenomena immediately as they occur. It challenges culturally learned ideas and implies that reality is socially constructed. Types of phenomenological sociology include ethnomethodology, social construction of reality theory, and feminist standpoint theory.

Additional alternative and contemporary sociological theories that may be influencing HRD include postmodernism, environmental sociology and sociobiology, and feminism. Each theory is briefly discussed.

Postmodernism is an analysis of modern society that focuses on the power of mass media in shaping social relationships and those popular culture influences our consumption. An important implication of postmodernism is that the value and utility of images and symbols is no longer regarded. As a result, "qualities like artistic merit, integrity, seriousness, authenticity, realism, intellectual depth and strong narratives tend to be undermined" (Strinati, 1995, p.225).

Among the most recent of the theories discussed, environmental sociology and sociobiology are interdisciplinary theories that combine sociological theory with either biology or environmentalism and examine the relationship between culture and nature. Environmental sociology may indirectly impact HRD by increasing our awareness of the dominion that corporations have over the environment. Sociobiology, or sociology of the body, is concerned with humans as a biological species within a culture; that how we perceive our bodies, how others perceive them, and how they perform is a function of society. Feminism, the study of how women are represented in

culture, is playing a dominant role in the sociology of the body. Feminism also addresses gender power issues and cultural and media representation of women. Especially in the West in the past two decades, feminism has played an important role in corporate culture.

It is difficult to ascertain the exact influence that any particular sociological theory has had on HRD. One conclusion is "it depends" on the organization, the corporate culture, and the societal culture. Since HRD is concerned with how people interact within organizational environments, it is axiomatic that sociological theories are fundamental to the theoretical foundations of HRD. Which theories are most influential is a matter of context. As HRD becomes more global and multiple cultures are considered, sociological theories such as symbolic interactionism, feminism, and eco-sociology will become more valid and will nurture new theories, research designs, and practices.

Ethics

Ethics is the newest addition to the theoretical foundations of HRD. Ruona & Swanson (1998) said that ethics and integrity of those ethics, are vital issues for the field of HRD (p.25). Rothwell and Sredl (1992, p.190) added that HRD professionals should be more keenly aware of ethical and value issues than most people. Dean (1997) concluded that we should consider ethics in our research and be included in our research agenda because "virtually no investigation can remove itself from the concern of ethics" (p.4).

Unlike the other four HRD disciplines, ethics as a body of knowledge has remained relatively stable over time. What has changed is the application of various theories, interpretation, and significance in business and industry especially within the last half of the twentieth century. Thus, the primary focus of this discussion is on use of varied ethics theories and the application or practice of ethics within an HRD or business context.

There are many and varied theories of ethics applicable in a business context. Take for example, *utilitarianism*, a philosophy based on the premise that no action is inherently good or bad, but only with regard to its consequences; and *deontology*, the study of moral obligations to universal principles.

Utilitarian thought suggests that people should promote the greatest amount of happiness for the greatest number and identifies moral actions as right in proportion as they promote happiness, and wrong as they produce pain and deprivation of pleasure. Deontology denounces that consequences dictate morality. As a deontologist, Kant maintained that people act according to moral rules or "categorical imperatives" which they would suggest everyone follow.

Successful organizations tend to subscribe to the Kantian ethical theory (Tuleja, 1985). Theories of ethics relevant to HRD depend upon appliation and substantiation in a business context.

Ethics are principles of right or wrong that motivate personal behavior and support or refute the correctness of such behavior. Ethics are interpreted through the interaction between the multiple contexts of individual ethics (based on morality, ideology, values, and experience), and the ethical climates of the organization, business, and society (Carroll, 1989). Interpretation of ethics is problematic within a global business context containing multiple societies.

The practice of ethics help us resolve ethical conflicts and manage ethical problems that are important in international contexts. HRD can help create and maintain an ethical climate within an organization which allows for individual ethical diversity yet promotes organizational and societal goal attainment. Structural issues such as establishing a code of ethics, reducing inducements for misdeeds, and raising the risk of exposure are operationalized in HRD programs.

Ethics is fundamental to the creation of organizational outcomes that result in social and moral responsibilities beyond that of creation of wealth. Thus, ethics as one of the theoretical foundations of HRD provides the vehicle for these outcomes to occur. However, the economic environment in which organizations flourish or decline, e.g., free enterprise, profit-oriented, and consumer-driven is exerting tremendous pressure to increase productivity and profit. Simultaneously, organizational impact on the environment, the community, and society is continually challenged and scrutinized. This dilemma is causing stress between organizations and society. Without a reliable vehicle with which to address the issues of social responsibility and responsiveness, organizations may abdicate to financial pressures, thus losing forever the opportunity to create a sustainable future.

In addition to organizational ethical issues, the ethics of HRD as a profession plays an important role in developing ethical behaviors in organizations and groups within a community. As HRD matures, codes of ethics and mores of acceptable behaviors will emerge and influence the growth of acceptable and unacceptable organizational ethics that impact individuals, organizations, and society.

Discussion

Organizations significantly and continually influence humanity and acquire dominance over social and eco-systems. Human resource development as an organizational function plays a principle role in enhancing the long-term sustainability of organizations and has the potential to help cultivate organizations that positively influence individuals, communities, society, and the environment. The theoretical foundations of a discipline dedicated to enhancing human development within organizations dictates its validity and, in many ways, its success as a field of study.

As an integral part of today's organizations, human resource development has an economic responsibility to the organizations who employ its professionals and methods and the HRD profession has a moral responsibility to individuals trained and educated and otherwise influenced. But, as discussed herein, HRD also has a responsibility to recreate itself through self-assessment to create a field of study that is responsible beyond out-dated social and psychological theories and traditional economics.

Shortsighted economic theory and obsolete theories of systems and morality are faithful to short-term returns and disjoined approaches to sustained change. Such theories hamper socially responsive organizational and positive societal changes and limit the sustainability of professions.

Shifts in theoretical paradigms are catalysts for progress toward sustainable development of the environment and humanity. It is incumbent upon applied disciplines, especially a discipline such as HRD in search of its own identity (Watkins, 1990), to systematically review its theoretical underpinnings to ensure their validity and worth. Such an undertaking identifies flawed theories and highlights more valuable and cogent theories.

Human resource development professionals and academics who respond to the challenge of updating and evolving the theoretical foundations of HRD will help to advance its theoretical rigor while correcting for the invalid influences of archaic disciplines.

Contribution to new knowledge in HRD

Although human resource development (HRD) as a field of study has been analyzed from its theoretical perspectives to a degree, there has been no distinct attempt to analyze and modernize the various disciplines that make up its theoretical foundations. HRD as a profession and a field of study must know how its theoretical foundations have changed and to what extent such changes may have affected it in order for HRD to remain a viable and rigorous field of study. This review of theoretical foundations of HRD serves as a catalyst, a "jumping-off" point for further investigation into the theoretical foundations of HRD with a focus on outcomes at the societal level.

The implications of this conceptual analysis are twofold. First, a more comprehensive study of alternative disciplines might shed light on more applicable and valid disciplines than HRD currently addresses. Second, since shifting theoretical paradigms influence HRD research and practice a review of how or to what extent research and practice have changed as a result should be completed.

Towards a Philosophical Framework for Thought and Practice

Wendy E.A. Ruona
Susan A. Lynham
University of Minnesota

Philosophy is often thought of as an abstract discipline with little practical utility. The goal of this paper is to revive philosophy as an important activity with much relevance in HRD. A framework which emphasizes a systems perspective of philosophy is proposed and each component is briefly described. Then, the practical contributions of philosophy are demonstrated by examining three current issues facing HRD.

Keywords: Philosophy, Thought and practice, Systems Perspective

Although often thought of as a discipline of abstract thought with little practical utility, philosophy can play a very useful and purposeful role in HRD. Before progressing further, think about the following scenarios:

> A CEO at ACME company calls in the company HRD professional and announces that ACME has got to be more proactive on issues of diversity. He requests that the HRD professional immediately begin to implement interventions that will address this problem. The HRD person accepts the assignment and begins his work. In the next six months, he creates policies and procedures on diversity and sensitivity, works with HR to set quotas for recruitment and hiring and implement new HR policies, and mandates sensitivity training for all management.
>
> At XYZ, Inc. across town, a CEO calls in the company HRD professional with much the same request. This person, however, requests sessions with the key leaders of the business to come to a better understanding of what diversity means to this company and clarify their business and moral motivations for pursuing interventions related to diversity. Six months later, the company has begun an set of coordinated interventions related to building and maximizing community at the company. The focus is on valuing diverse contributions and eliminating barriers that hinder individuals in achieving their goals. There were very few new policies set, no quotas mandated, and the training and OD efforts emphases integration and optimization of diversity.

These HRD professionals both faced the same presenting problem. They were charged with confronting diversity practices at the companies in which they worked. However, the resulting interventions differed greatly. Why is this? Some analysts might conclude that the differences had to do with competence of the HRD professional, differing company cultures, or the desires of top leadership. However, if we look beyond these things we might have discovered that the real differences were much deeper. Each of these two HRD professionals brought fundamentally different philosophies to their work. If we had been able to interview them, we might have discovered that the HRD person at ACME and the person at the XYZ, Inc. differed greatly in some of their basic assumptions about diversity. Table 1 outlines a few possible ones we might have found.

The beliefs that each HRD professional brought to their work fundamentally impacted the shape and qualities of the interventions that followed. These beliefs affected how they were able to think about and evaluate issues related to diversity, how they assessed needs in the organization, and their actions in the organization. Moreover, if an HRD researcher had been investigating these interventions, the way in which these they were studied would have been influenced and the findings would have also been quite different between the companies.

Now, this example may feel a bit exaggerated to you, however this is what goes on everyday. How one views the world impacts all else that flows from that view. This is certainly not "new" news. Senge (1990) alerted us to the "iceberg nature" of deep structural issues and how these change the shape of what is seen and done. In this sense too, assumptions and beliefs about the world and knowledge change the nature of what we see, know, and do in HRD. Yet, many past conversations in HRD have been largely about what would be the metaphorical "top" of the iceberg. Until we look beneath the action of practice and research, we will be unable to tend to fundamental issues and challenges facing our field.

Table 1

Example Beliefs of Two HRD Professionals.

Beliefs/Assumptions	HRD Professional at ACME	HRD Professional at XYZ, Inc.
What is Diversity?	• A problem to be solved and managed. • Not an enhancer of business performance.	• An opportunity to reflect on community and create in new ways. • An issue of human differences inherent in business, that enhances a business's competitive position.
Differences	• Should be minimized so people can work together better and easier.	• Should be maximized for optimal performance.
Conformity	• Conformity to a "majority" view is good .	• There are multiple worldviews and ways of doing things and these should be fostered.

Purpose of this Paper

The purpose of this paper is to provide a focus for new conversations—to re-stimulate discussion of philosophy underlying HRD theory and practice. A framework which emphasizes a systems perspective of philosophy is proposed and each component is briefly described. Next, the importance of philosophy is discussed at two levels. First, generically in terms of what philosophy, as an activity, offers. Then, more specifically, as a framework to elucidate how current issues facing and being dealt with in HRD, both practical and theoretical, fit into a broader philosophical context.

What is Philosophy?

The word "philosophy" is a word of Greek derivation meaning "the love of wisdom" (Cavalier, 1996, p. 2). A traditional view of philosophy is that it is the field of ideas and thinking about life and everything in it. This seems a bit lofty for many who must cope with practical problems on a daily basis. However, philosophy is generally concerned with three basic issues: being (ontology), knowing (epistemology) and acting (axiology). Through these foci philosophers are interested in answering the following three questions: (1) What is real? (a question of ontology), (2) What is true? (a question of epistemology), and (3) What is good? (a question of axiology).

If one thinks about these foci as separate areas of inquiry, then philosophy does not seem to serve much purpose. However, in actuality, these three areas all work together to make philosophy what it is. In this sense, from a systems perspective, the whole is more than the sum of its parts. A revival of philosophy as a highly practical activity hinges on our capacity to view it as a set of interacting components which, when viewed as a whole, have properties that do not exist within any of the smaller units (Heylighten & Joslyn, 1992). Systems theory, which has been advocated as a foundational discipline by many in HRD (Ruona, 1998; Swanson, 1998; Willis, 1997; Gradous, 1989), reminds us to view the multiple tiers and relationships that exist between these components of philosophy.

A System of Interacting Components of Thought and Practice

To get a sense of the potential utility of philosophy one needs to consider philosophy as a system of thought and action (Bohm, 1994). That is, as an activity or process of inquiry that is concerned with disciplined reflection, ways of thinking about certain questions, interpreting texts, trying out ideas and thinking of possible arguments for and against them, and wondering about how concepts really work.

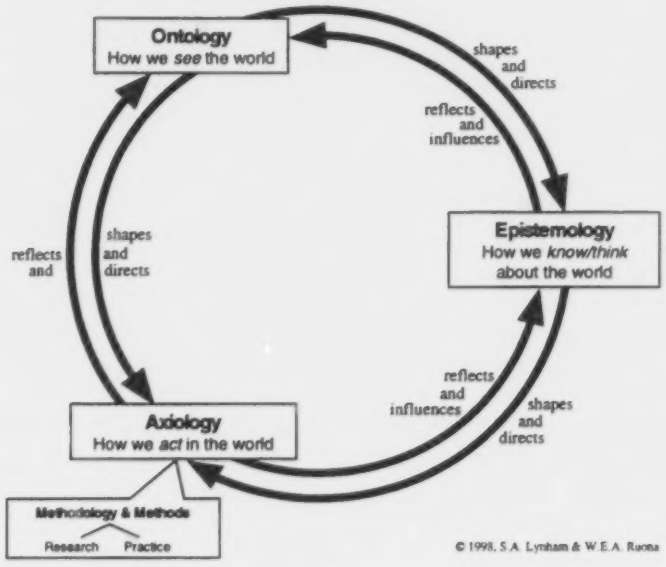
We therefore see the critical components of a philosophical framework for HRD as consisting of three key components.

1. Ontology: the component that makes a view of the nature of the world and nature of phenomena of interest to HRD explicit (how we *see* the world);
2. Epistemology: the component that makes the nature of knowledge in HRD, and the necessary and sufficient requirements to hold and claim knowledge in our field explicit (how we *know/think* about the world);

3. Axiology: the component that makes explicit how we ought to act, individually as well as communally in our field. It outlines espoused aims, ideals and proper methodologies and methods for HRD inquiry and practice (how we should *act* in research and practice).

These three components interact in a dynamic and systemic way, together forming a guiding framework for a congruent and coherent system of thought and practice in HRD. Figure 1 shows the interactive and dynamic relationship among the key components integral to a sound philosophical framework for research and practice in HRD. It elucidates the connections—demonstrating that how we *see* the world determines how we *think* about the world, how we *think* about the world determines how we *act* in the world, and how we *act* in the world, in turn, reflects how we *think* about and see the world. And, that each of these components reflects and influences the other.

Figure 1. A Philosophical Framework for Thought and Practice.



Philosophies can be individually held. More commonly, however, philosophies are shared. History is characterized by phases where different prominent philosophies influenced current conditions, actions, and events. In education, for example, the philosophical schools of thought forwarded by Dewey and Snedden are consistently contrasted and analyzed for their varied impacts on schools in America. In business, Taylor's scientific management philosophy is being replaced by more organic views of how organizations function and disciplines like HRD are helping organizations cope with the far-reaching implications of this change. It is our presupposition that HRD must begin to identify its own philosophy as a community of professionals engaged in "improving individual and organizational performance through learning" (AHRD, 1998). The next section briefly overviews each component of philosophy to offer a common basis of understanding and discusses the utility of each component in HRD.

Core Components of Philosophy

What is Ontology?

Definition Ontology is concerned with fundamental assumptions about the nature of phenomena (Gioia & Pitre, 1990). It focuses on basic questions and assumptions about the nature of reality—questions like: What is real? What is "there" and what do we mean by "there"? What is the world made of? Is reality ordered in any way? Is reality "out there" or "inside us", or a combination of both? What are humans? Kuhn (1970) also introduced another way of thinking about ontology in his notion of a paradigm. A paradigm is a worldview, or a way of thinking that reflects fundamental beliefs and assumptions about the nature of phenomena. An ontology, ulimately, is how one sees and views the world and reality.

Utility Mapping the ontology of a field involves making explicit the common understandings, beliefs and assumptions of how those in the field see the world, of how they perceive the essences of reality and phenomena that constitute the field's concern and focus. It is about identifying and articulating the core assumptions about reality that drive the thought and practice of a field.

What is Epistemology?

Definition Gioia & Pitre (1990) describe epistemology as "fundamental assumptions about the nature of knowledge about phenomena" (p. 585). Epistemology (also described as theory of knowledge) is the component of philosophy that raises questions about the nature of knowledge and reasonable belief. In so doing, it addresses the following kinds of questions: What is knowledge? How does knowledge differ from mere opinion or belief? How is knowledge acquired? When is a belief justified or reasonable?

Central to epistemology is the Socratic, tripartite equation of knowledge which states that *knowledge = true, justified belief* (Pojman, 1995). Epistemology is therefore concerned with not only the nature of knowledge, but also examines the necessary and sufficient conditions required for these components of knowledge (Root, 1997). Epistemology is about how we know and think about the world.

Utility Examining the epistemology of HRD involves articulating the common assumptions, thoughts and understanding of what makes for knowledge of and about phenomena in HRD. It also denotes the necessary and sufficient standards for knowledge in HRD. It therefore serves a purpose of both clarification of the nature of knowledge and standards for "good" knowledge in a field.

What is Axiology?

Definition Axiology (sometimes referrred to as ethics), a third component of philosophy, is concerned with action. It is normative, speaking to issues of ethics, what is good, and what ought to be done. In other words, it indicates how one should *act* in inquiry and practice, and the extent to which this action should be congruent with ontological and epistemological aims and ideals.

Utility Axiology urges congruence between the ontological and epistemological assumptions and the espoused actions of a field. Thus, axiology plays an important role in putting the standards and requirements of acceptable methodology and methods for research and practice in HRD in place. Making the axiology explicit helps to set and clarify the guiding tone and rigor for action in HRD. It helps to define desired standards for methodology and methods in both research and practice.

What is Methodology and Methods?

Definition The concept of axiology is broad and includes quite a few things. There seems to be some ambiguity in philosophy about what comprises axiology. However, two important elements of axiology would seem to be methodology and methods. Methodology is defined as the system that influences the way things are done—how we choose and use methods, and conceptualize, analyze, collect, and design. Methods are means and manners of procedure.

Due to the applied nature of HRD, methodologies and methods need to be considered in the context of both research and practice. Methodologies in research inform us of ways of studying phenomena (Gioia & Pitre, 1990) while methodologies in practice inform us of ways of carrying-out interventions in HRD. Methods in each domain expand the methodologies by offering tools, techniques, and procedures. See Figure 2 for some examples of how methodologies and methods are connected.

Utility Specifying methodology and methods for conducting research and practice enable us to "rigorize" research and practice in HRD. This rigor demands that we judge research and practice against desired standards that are inherent in axiology. Given the rising concern about increasing atheoretical practice (Swanson & Holton, 1997) and unuseful theory in HRD, a framework and criteria for judging the utility of research and theory and the soundness of practice would seem to be both welcome and useful.

Figure 2
Two Important Elements of Axiology.

	Methodology	Methods
Research	*Positivistic*	• Experimental • Quasi-experimental • Survey
	Interpretive	• Phenomenology • Case Study • Etc....
	Critical Science	• Critical Theory • Feminist Theory • Etc...
	Methodology	**Methods**
Practice	Training and Development	• ADDIE • Performance-Learning-Satisfaction Evaluation • Etc...
	Organizational Development	• Action Research • Intervention models/processes • Etc...

Why is Philosophy Important?

Philosophy helps develop capacities for thinking (Honderich, 1995). At the heart of it, philosophy is a systematic examination of the assumptions that underlie action. Theories-in-use are investigated and analyzed to surface the essences of thoughts and ideas that, ultimately, drive actions. Magee (1971) tells us that "one of the tasks of philosophy is mapping the logic of...discourse, laying it out, so to speak, so that a person can make his way about it successfully" (p. 45).

In fulfilling this role, it affords practice in criticism. Examples of this include building counter arguments to common wisdoms (Root, 1993) and developing examples for questionable generalizations. It also develops responsiveness to concrete cases and an appreciation of the thinking expressed in these. Finally, it enables interpretation and theorizing, for example, by relating positions of one area of inquiry to those in another.

Philosophy thus provides us with 1) practical ways of thinking about certain sorts of questions (questions of the nature of reality, truth and ethics) and 2) the use of logical argument, disciplined reflection, and theoretical reasoning in this questioning process. It helps us develop skills to critically think about things concerning the nature of the world, justification of beliefs, and the conduct of life. Philosophy engages us in the interpretation of texts and the criticisms of common wisdoms that are often taken for granted.

Implications for HRD

There is certainly utility in each of the components described above. In addition, philosophy offers a context in which to view current issues being dealt with in HRD. Three areas that philosophy can impact are discussed here: 1) practice, 2) research and theory building, and 3) the evolution of HRD.

Implications for Practice

Reflection about philosophy (ontology, epistemology, axiolgy) ensures that as practitioners we are leading, in Plato's words, an "examined life", acknowledging that beliefs about basic ends and principles lead to concrete conclusions and action. This process can be done unconsciously where it is subject to many hazards. Or, it can be done consciously where one (or an entire field) strives for clarification and alignment. This is not to say that this clarification process is ever finished—it is a continual process where "new light is always dawning on meaning of concepts at every level, with the consequence that the whole enterprise has to be forever examined" (Magee, 1971, p. 47). However, striving for the identification of key beliefs and assumptions about each of the three components and, then, being grounded in those articulated by the discipline of HRD will undoubtedly result in better and more

consistent practice. This is especially relevant in HRD, an applied field driven by its practice, where theory sometime lags behind the challenges being faced in organizations. Philosophy provides some structure on which to make decisions when research is not there to support a practice or policy. Magee (1971) identifies the importance of philosophy to complement science when he explains:

> Conclusions about what to do are a mixture of judgements about the "excellencies to be produced" combined with empirical or scientific knowledge about how to produce them. It is important to notice that we cannot derive the list of prescriptions, excellencies, that are a set of value judgements about what to do, from the descriptive, empirical, knowledge accounts of what the facts usually are. It is, in short, not possible to go directly from scientific understanding to policy and practice. Practice is always a combination of prescriptive convictions and descriptive understanding. (p. 46)

The logic of philosophy allows us to engage in thinking that is at once disciplined and imaginatively creative. We are able to apply philosophical methods to practical problems and ascertain what the issues are and how different assumptions affect the problem. In addition, we can use philosophy to analyze and interpret practice. In these ways the idealism of philosophy can be used to improve how we address practical problems. The act of philosophy cultivates the capacity and appetite for reflection, for exchange and debate of ideas, for life-long learning, and for dealing with problems for which there are no easy answers.

Implications for Research and Theory Building

HRD has recently turned its attention to an important phase of its own development. There is increasing effort being invested in the areas of theory-building and research. Critical work is being done to encourage and refine research methods and paradigms (Swanson & Holton, 1997; Marsick, 1990) and to call attention to the importance of building theory in HRD (Mott, 1998; Hansen, 1998; Torraco, 1997; Chalofsky, 1996). The motivation driving these efforts is to undergird HRD with a solid, systematically-acquired knowledge base.

Another important part of the evolutionary process is to acknowledge the philosophical framework in which these discussions are taking place. A worthy debate on paradigms for research and theory-building between Marsick and Passmore in 1990 hinted at connections of research with epistemological concerns and even with notions of worldview (ontology), but these connections are rarely made. Many discussions of research and theory-building are happening in a vacuum concerned with only science and methods, or the "how to" of generating new knowledge. For the most part, scholars have agreed that there are two primary ways of doing research (quantitatively and qualitatively) and have urged people in the field to get on with the business of researching.

While this is practical and necessary, there is certainly merit in also placing knowledge-generation in a philosophical framework—put in it's place, as it were, and strive to understand how it is connected with how we see, think about, and act in the world. Research and theory-building are only parts of an overall context that drives HRD. How we see the world and what we recognize as knowledge in HRD fundamentally affects the methodologies we employ to research and build theory. A too limited view of ontology and epistemology can limit the scope and utility of HRD. A too broad view can lead to the slippery slope of relativism where there are few standards. Philosophy ultimately requires us to consider what knowledge and theory really are. When placed within a context of assumptions about reality and nature our current views of these things may or may not change. Marsick (1990) states:

> ...if we are to describe accurately and explain the world we research, then, as we work we must test our assumptions about what we view as knowledge, whether our view is compatible with the nature of organizations and the phenomena we are researching, and how we believe we should go about researching these phenomena. (p. 33)

It is important to acknowledge how science and philosophy complement one another and proceed on a journey that demands work in both areas from HRD scholars. Philosophy is not more or less important than science, it is just different. While science tells us what the world contains, philosophy asks about different ways to classify these things. While science produces knowledge, philosophy asks what we can know and how. While science provides new knowledge of the observable or based on experimental tests, philosophy suggests "rules" for the stuff of reality and how it is organized. Philosophy looks behind science and analyzes concepts/notions and methods that are used. It pushes a discipline such as HRD to strive for even more than good research. In this way, philosophy

may suggest important standards of rigor for research and theory building that have yet to be considered.

Implications for the Evolution of HRD

Philosophy also plays an important role in the future of HRD. HRD continues to deal with perennial issues that threaten its stability and future effectiveness. Recently, Warren Topp (1998) introduced these authors to the concept of a "conversation having us"—that is, of a conversation which is going-on and becomes the prominent focus such that little else actually happens except the having of the conversation. Very few new thoughts are generated, positions are defended, tradition weighs heavy, and very little progress is made in understanding and creating new meaning. Some would say that HRD is currently engaged in a few of these kinds of conversations.

One such issue is the purpose of HRD which has been heavily discussed during the last five years. Philosophy can provide a framework for articulating the purpose of the field and moving past the conversation having us. Instead, we need to have the conversations—and the only way this will happen is if we really begin to explore the deep assumptions that drive our field. It is at this level that generative conversations take place and real change begins (Topp, 1998; Bohm, 1994). Surfacing and clarifying key assumptions about ontology, in particular, provides a set of criteria to guide future discussions of what is and isn't HRD. We can analyze different schools of thought emerging in HRD (i.e. performance and learning) to see where they come together and where they do not. Philosophy can be a rigorous backdrop for judging whether and to what extent the field can accommodate multiple definitions and purposes. This same set of criteria can also be used to balance the long- and short-term interests of HRD—helping us to do both for the optimization of the field. Philosophy can be an important mechanism to guide the nature of conversations that need to continually be held in HRD. This will ensure that HRD grows well.

Another issue that is increasingly being discussed is that of professionalization in HRD. The focus of a 1998 AHRD symposium, the issue is multi-faceted and controversial. One of the emerging dilemmas is what any kind of credentialing or certification would be based on. Reflection, theory-building (Mott, 1998; Hansen, 1998), research, and competencies have been suggested as possible bases, while others have suggested bases that are more philosophically grounded. Ellinger (1998) and Watkins (1990) have both advocated an integrated vision and values. Chalofsky (1996) suggested that the discipline's core must include philosophy and mission, theory and concepts, and roles and competencies. It is presently unclear where this conversation will lead and how it will impact the future of the field. However, it is clear that philosophy and the above-proposed framework for thought and practice in HRD will factor into it.

Conclusion

The purpose of this paper was to provide a focus for new conversations—to re-stimulate discussion of philosophy underlying HRD theory and practice. It offered a framework in which to think of philosophy more systemically and demonstrated the potential impact that philosophy can have in HRD. In closing, we are reminded that during the first century of science, many great scientists considered themselves to be revivers or rediscovers of knowledge. We now invite you to join their ranks and revive philosophy as an important context in which to couch paradigmatic and methodological progress in HRD.

The Need for Theoretical Model Building in HRD

Tom Shindell
Northeastern Illinois University

The problem addressed in this paper is the lack of conceptual clarity and definition in the field of HRD. Through literature review and analysis, four significant related issues are presented, and five ways theoretical model building can facilitate conceptual clarity and definition in HRD are identified.

Keywords: HRD, Theory, Model

For a field growing, expanding, and trying to define itself (Jacobs, 1990; Marsick, 1990, 1990a; Watkins, 1990; and Chalofsky, 1992), Human Resource Development (HRD) has surprisingly few "HRD" theories and models specific to the field. Four significant issues related to this observation are: 1) the very diverse philosophical - methodological - practical stances taken towards what is appropriate for HRD research, 2) no clear, widely accepted definition of this evolving field, 3) the lack of "HRD specific" research, and 4) the lack of theoretical model building evident in the literature. The problem of this study is the lack of conceptual clarity and definition in HRD, and the research question is, "How can theoretical model building facilitate conceptual clarity and definition in HRD?"

The Philosophical and Methodological Issue

Marsick (1990, 1990a) and Passmore (1990) articulate some of the conflicts currently faced by researchers as they attempt to create research and build the field of HRD from various philosophical, methodological, and practical perspectives. Some of the academic and practical tensions existing between various rational, empirical, positivistic stances toward what is acceptable, needed, and meaningful research for the field of HRD versus various contextual, rigorous, post-positivistic stances towards what is acceptable, needed, and meaningful are indicated. The question is not do researchers and practitioners build and develop the field of HRD relying only on knowledge derived from various postivisticly oriented experiments, surveys, etc., or various post-positivisticly oriented case studies, phenomenological observations, etc., or both. Rather, as Marsick and Passmore agree, research and theory building are desperately needed, regardless of the philosophy and methodology employed. Dubin's (1978) position is that a theory/model developed from any philosophical perspective and employing any appropriate methodology is acceptable.

Moreover, Dubin (1978) asserts that it is not philosophical perspective or methodology employed, but "consesus" that determines a theory/model's acceptability. Consensus is the key, and he indicates that there are three different ways in which consensus can be reached: 1) the agreement of experts, 2) the logic utilized in the development of the theory/model, and/or 3) the proof provided by empirical testing of the theory/model.

The Lack of a Unifying Definition Issue

Chalofsky (1992) states, "One of the more debated issues in the field has been the need for a unifying definition that would not only provide a focus for the development of the profession but would also set limits on the boundaries of the field." He points out that there are many definitions of the field of HRD, and presents seven of them:

> *Nadler's* from 1990, "Organized learning experiences in a given period of time to bring about the possibility of performance change."
>
> *Chalofsky and Lincoln's* from 1983 which offers specific definitions of HRD from five perspectives: philosophical, operational, functional, field of practice, and field of study.
>
> *McLagan's* 1989 which was sponsored by the American Society for Training and Development, "HRD is the integrated use of training and development, career development, and organization development to improve individual and organizational effectiveness."

Copyright © 1999 Wendy E.A. Ruona & S.A. Lynham

> *Gilley and Eggland's* from 1989, "Organized learning activities arranged within an organization in order to improve performance and/or personal growth for the purpose of improving the job, the individual and/or the organization."

Smith presents two definitions from 1990, "The process of determining the optimum methods of developing and improving the human resources of an organization and the systematic improvement of the performance and productivity of employees through training, education, and development, and leadership, for the mutual attainment of organizational and personal goals."

> *Watkins'* from 1989, "The field of study and practice responsible for the fostering of a long-term, work-related learning capacity at the individual, group, and organizational level of organizations."

Chalofsky (1992) proposes a unifying definition after finding the common denominators of these seven definitions, "Human resource development is the study and practice of increasing the learning capacity of individuals, groups, collectives, and organizations through the development and application of learning-based interventions for the purpose of optimizing human and organizational growth and effectiveness."

The Lack of HRD Specific Research Issue

HRD borrows, applies, absorbs, and transforms knowledge, theories, and models from many other disciplines (Jacobs, 1990). But, for a field to delineate itself successfully, it needs some theories and models to "call its own." The field does have the *ASTD Models of Practice* and other theory/models of parts of the field (career development, organization development, training evaluation, etc.), all of which could contribute more to the clarification and definition of the field if they were tested in HRD specific research.

The Lack of Theoretical Model Building Issue

A preliminary review was conducted of the articles published in *Human Resource Development Quarterly* to examine these that discussed the need for theory/model building and the state of clarification and definition in the field of HRD. Jacobs (1990) makes several points about the need for theory/model building: 1) "focused theory development and research are important means of evaluating the relative status of an area of professional practice," 2) "the need arises to formalize the knowledge gained in practice into some logical structure," 3) "theory development and research are essential activities...keeping in mind that relevance to practice remains the ultimate criterion for the worth and value of theory," 4) "HRD research efforts must continually be guided by an underlying theory" and 5) "Theoretical knowledge about HRD must logically grow in an incremental fashion." He then cites the need for the generation of new propositions. Marsick (1990, 1990a), Passmore (1990), and Watkins (1990) all concur about the need for clarity and definition in the field achievable in part by integrating theory/models.

An exploratory study was conducted to determine the extent to which theoretical model building was evident in the literature. This study identified 614 dissertations that fit the key words "theoretical model building" listed in the *Dissertation Abstracts International* database covering the past 18 years. On review, the majority of the dissertations were found to be theory/models in such areas as computers, physical sciences (such as thermodynamics, hydrology, architecture, etc.), economics and political theory. Those even remotely related to HRD, training, management, and education numbered 37 or only 6% of the dissertations.

A more detailed analysis of the 37 dissertations was completed to determine both which were HRD specific, and which were not HRD specific but were related to the field. These dissertations were further analyzed to determine which developed a theory/model (using various methodologies/approaches), which refined a previously proposed theory/model (using various methodologies/approaches), which tested a theory/model (using various methodologies/approaches), and which utilized Dubin's methodology for theory/model building. This analysis yielded the results indicated in Table 1.

Most studies developed a theory/model but unfortunately, research was focused primarily on proposition rather than testing (only half of the theory-research cycle). Even those dissertations which were not clearly HRD but related to the field were theory/model development only. Another content analysis study was conducted to analyze the types of dissertations completed in a higher education administration department at one university (Sharpe,

1993) had as its first recommendation, "Dissertation research in the department should become more based on theory and contribute to building theory."

Table 1 - Theoretical Model Building Dissertations

37 (6%) Dissertations HRD or HRD Related Out of 614 Dissertations Matching Key Words "Theoretical Model Building" (100%)

27 HRD Dissertations (73% of the 37 Dissertations)							10 Related Dissertations (27% of the 37)	
Developed a Theory/Model 16 (43.3%)			Refined a Theory/Model 8 (21.6%)		Tested a Theory/Model 1 (2.7%)	Utilized Dubin's Methodology 2 (5.4%)	Developed a Theory/Model 10 (27%)

Theoretical Model Building

There are various levels of theory - micro, macro, middle-range (Merton, 1968) and types of models - literary, academic, eristic, symbolic, postulational, formal, interpretive (Kaplan, 1964). After observing that theory, theoretical model, model, and system are essentially interchangeable, Dubin (1969, 1978) suggests that whatever level or kind of theory/model offered is acceptable for use in what he calls the "theory-research cycle." This theory-research cycle is a process of inquiry and knowledge development in which theories/models are created to explain or predict and then are tested and redefined or refined. This is a process of suggesting, testing, refining, suggesting, testing, and refining, etc. This is a process of clarification and definition.

According to Dubin (1978) there are several critical considerations about the theory/model and its linkage to the theory-research process. First, the theory/model is unlimited in its scope – only the limits of human imagination and reasoning set boundaries. Second, the theory/model is more than just statements of hypotheses or the presentation of variables – it has units, laws of interaction, boundaries, system states, propositions, empirical indicators, and hypotheses to be tested. Third, the adequacy of a theory/model is always and only determined by the logic of the reasoning used to create the theory/model. Fourth, the reality of a theory/model (how well it matches the "real world") is always and only determined by submitting the theory/model to testing and experimentation. Fifth, a theory/model is "scientific" if, and only if, the theory/model is submitted to empirical testing.

Conclusion

Several ways in which theoretical model building can facilitate conceptual clarification and definition in HRD are by:

1) modeling the theoretical components of expert definitions in theory-research cycles towards a unifying definition of HRD,
2) modeling HRD specific research in theory-research cycles towards identifying gaps in HRD research,
3) modeling components of HRD towards delineating boundaries of the field,
4) indicating direction for future research efforts based upon propositions and hypotheses developed, and
5) enabling further dialogue and reflection in the field.

As Watkins (1990) says, "We need research and model building to figure out who we are." We need specific HRD focused research, and incremental theoretical model building to achieve more and more clarification and definition of the field.

Bridging the Gap With a Multidimensional Performance Model

Susan Reynolds Fisher
Catherine M. Sleezer
Oklahoma State University

This paper offers a complex, dynamic model in which three aspects of performance—capacity, process, and accomplishment—are defined at four levels of the organization—individual, group, organization, and industry. The model incorporates the resource-based view of the firm from the strategy literature with the systems perspective from the performance improvement literature. A selected sample of research from micro and macro fields of organizational studies is reviewed and categorized to illustrate the model.

Keywords: Performance, Systems, Multilevel Measurement:

Ever since Rummler and Brache (1992) introduced a performance improvement model that explicitly addressed levels issues, human resource development (HRD) professionals have been aware of the need to consider the interrelationships among individual, process, and organizational levels. Unfortunately this awareness has not manifested itself in either practical solutions or grounded theory. Swanson (1998) claims that the reason for this gap in knowledge and research is that HRD and performance improvement researchers have historically favored the psychological foundations of the field over its economic and systems foundations. "As a result, what is called organization development is reduced to individual development or team development in hopes of achieving improvement in organizational performance" (p. 12).

Sleezer, Zhang, Gradous, & Maile (in press) have proposed a *Systems Model of Performance* to aid in understanding levels issues and to focus on the interplay among three essential aspects of performance. Their model integrates the scientific management, instructional design, and systems views of performance into a three-by-three matrix with cells allotted to performance *capacities*, *processes*, and *accomplishments* at three hierarchical levels of the organization—*individual*, *team*, and *organization*.

The purpose of this paper is to build upon this work in three ways: (1) expand the model by adding industry to its hierarchical levels and incorporating the *resource-based view* of the firm; (2) clarify the model's definitional foundation; and (3) collect studies from across organizational research streams that illuminate issues related to each cell of the performance matrix. In the process of expanding and further defining the *Systems Model of Performance*, a new configuration emerged that we call the *Multidimensional Performance Model*. This model led to several discoveries related to a dynamic view of organizations and performance improvement.

Expanding the Original Model and Clarifying Definitions

Holton (1998) suggests that HRD professionals too often use the "individual lens" in addressing performance issues, while strategic management researchers tend to confine themselves to the organization and industry lens. By adding the industry level, we address this gap and transform the performance matrix into a multidisciplinary model. The resulting model frames the organization as a complex, dynamic entity comprised of interacting subsystems that also interrelate with other complex systems outside organizational boundaries (Boulding, 1956). Bringing the industry level into the matrix allows for consideration of the organization's performance among its competitors and its relationships to market and economic forces. It also permits consideration of the *resource-based view* of the firm.

The resource-based view (Barney, 1991) is the first theory of the firm growing out of the field of industrial/organizational economics to incorporate human factors in a significant way. Proponents of this view acknowledge that the idiosyncrasies common to complex organizational systems may be the source of sustainable competitive advantage (Reed & DeFillippi, 1990). These idiosyncratic resources—many of which are embedded in the social subsystems of the organization—include human and organizational capital such as unique product or market knowledge and cultures that support risk-taking, innovation, and responsiveness. Because they are acquired over time, these resources are path-dependent. They also may be causally ambiguous because they result from processes that are not easily visible to or understood by competitors. Another way to think of such resources is as outcomes of organizational learning (Glynn, Lant, & Milliken, 1994; Senge, 1990). The learning process is the glue

Copyright ©1999 Susan Reynolds Fisher and Catherine M. Sleezer

BEST COPY AVAILABLE

that ties process and outputs together over time and increases their value to the organization. The accumulation of such idiosyncratic learning—what Sleezer, et al. identify as *capacity*—can be the source of future growth and performance leading to competitive advantage.

Sleezer and her co-authors use a baseball analogy to illuminate the meaning of *capacity*, *process*, and *accomplishment* at three hierarchical levels. Using their matrix as a starting point, we added the industry level, further clarified and expanded definitions, and reordered the cells. The results are shown in Table 1.

Table 1. Multidimensional Performance Matrix Definitions

	Capacity	**Process**	**Accomplishment**
Individual	The accumulated bundle of individual capabilities and resources available for present and future work requirements (such as decision-making, adaptation, innovation, and learning).	Patterns of actions and interactions carried out by individuals using resources (information, machines, and people) to produce output designated by their jobs or to create innovative outputs.	The outputs of an individual's work activities that add value to the organization.
Group	The accumulated, idiosyncratic bundles of group capabilities and resources available for present and future organizational activities (such as high-speed decision-making, adaptation, innovation, and identification of strategic issues).	Patterns of interaction carried out by two or more individuals with resources (information, machines, and people) to produce collective output designated by their organizational unit or to create innovative outputs.	The outputs of formal and informal group work activities that add value to the organization.
Organization	The accumulated, idiosyncratic bundles of skills, knowledge, and tangible and intangible assets embedded in the formal and informal organizational structure and culture available for strategic decision-making, adaptation, and innovation leading to competitive advantage.	Patterns of interaction carried out by the organization and its subsystems with resources (information, machines, organizational members and groups) to produce output designated by organizational goals and mission or to create innovations.	The outputs of an organization's activities that increase its value and perpetuate its existence by satisfying its stakeholders
Industry	The accumulated bundles of skills, knowledge, and interorganizational linkages shared by organizations competing in the same market available to support and sustain industry evolution.	Patterns of interaction carried out by the organizations competing in the same market to produce mutually beneficial output or develop innovations.	Outputs derived from the competitive interrelationships of organizations operating in the same product markets.

The *capacity* aspect of performance includes the classic tangible resources—land, labor, and capital as well as all organizational processes, capabilities, firm attributes, information, and knowledge that enable the firm to develop and implement value-creating strategies (Barney, 1991). Idiosyncratic resources include the experience, intelligence, relationships, insight, and judgment that reside in the firm's formal reporting structure and coordination systems and its informal networks. The components of *capacity* are derived in three ways: (1) they are brought in from outside as the firm acquires physical, financial, and human capital; (2) they are developed within the firm by direct processes such as designing organizational systems; and (3) they are generated through learning as the indirect by-products of organizational activity.

In defining *process*, we assume interaction to be a necessary condition. The patterns of interaction that are considered process also must result in either (a) outputs designated by the job, the organizational unit, or the organizational mission or (b) unintended outputs or innovations that emerge from the process. The definitions in the *accomplishment* column focus on outputs that are valued by stakeholders. The term "valued outcomes" may include

BEST COPY AVAILABLE

products, services, and new knowledge acquired as a result of organizational processes that can add value to future outputs (Nonaka, 1991 Lado & Wilson, 1994).

The three aspects of performance have distinctively different characters. *Capacity* is a reservoir of diverse tangible and intangible assets and capabilities that are brought to the firm from the outside or generated as by-products of the firm's activities over time. By contrast, *process* requires interactions over time, and *accomplishment* describes an end state—the outcome of a process.

Research Review and Discovery

We reviewed multi-disciplinary research with the intent of producing a representative sample of literature that could help scholars and practitioners in using the Multidimensional Performance Matrix. Although not exhaustive, our review included studies from human resource development, organizational behavior, industrial/organizational psychology, industrial sociology, organization theory, and strategy. We specifically sought research examples to exemplify each of the twelve cells in the matrix and limited our search to major journals and research published since the mid 1980s.

We were immediately struck by the variety of ways in which performance was defined in organizational research. Many studies with a macro focus used traditional quantitative global measures such as return on investment (e.g., Miles, Snow, & Sharfman, 1993) and profitability (e.g., Eisenhardt, 1989). Studies with a micro focus used such quantitative measures as task performance (e.g., Kirkpatrick & Locke, 1996; Morrison, 1993). There were also studies from both micro and macro fields that used goal achievement (e.g., Pritchard, et al., 1988; McGrath, MacMillan, & Ventakaraman, 1995; Browning, Beyer, & Shetler, 1995; Hill & Hellriegel, 1994). In addition, several studies measured performance as change in terms of adoption of innovation or new technology (e.g., Robertson, Swan & Newell, 1996; Elg & Johansson, 1997) and decision adoption (e.g., Nutt, 1993). The studies that relied on qualitative methodology used more divergent measures ranging from supervisors' evaluations of performance (e.g., Atwater & Yammarino, 1992), to self-reported perceptions of performance (e.g., Cohen & Ledford, 1994; Youndt, Snell, & Dean, 1996), changed cognitive schema (e.g., Poole, Gioia, & Gray, 1989), decision merit (e.g., Dean & Sharfman, 1996), quality of group process (e.g., Prussia & Kinicki, 1996), and satisfaction (e.g., Campion, Medsker, & Higgs, 1993).

Levels Issues

Not only were performance measures widely varied, but many studies crossed two or more hierarchical levels as well. Among these studies were several examples of misspecification and the cross-level and contextual fallacies common in multilevel research (Rousseau, 1985; Klein, Dansereau, & Hall, 1994). In some studies data was aggregated from one level to draw conclusions about performance at a higher level without acknowledging the threats to validity inherent in such manipulation Other studies made leaps of faith that conclusions observed at one level automatically existed at or affected performance at another. Several authors also were caught in the anthropomorphism trap by speculating about the collective organization as if it were an individual. In her seminal article on the pitfalls of multilevel research, Rousseau (1985) asserted that sound multilevel research explicitly delineates functional relationships and carefully links focal level with levels of measurement, analysis, and generalization. We found several studies that accomplished this by either explicitly restricting their theory, measurement, and analysis to a single organizational level (e.g., Smith, et al., 1991; Rowe & Cooke, 1995) or clearly acknowledging and confronting issues of multiple levels (e.g., Eisenhardt, 1989; Robertson, Swan, & Newell, 1996).

Levels issues are indigenous to organizational research. "By their very nature, organizations are multilevel" and "no construct is level free....To examine organizational phenomena is thus to encounter levels issues" (Klein, Dansereau, & Hall, 1994, p. 198). In creating a matrix that specified distinct boundaries between levels, we had understated the reality of multilevel phenomena in organizations. This realization led us to modify our research classification scheme by first determining whether the studies were single or multilevel in design.

Performance Aspects Are Fluid

Our review of the research also revealed that the Multidimensional Performance Matrix understated the fluidity of performance across the aspects of *capacity, process,* and *accomplishment.* In the majority of studies we reviewed, the *capacity* category actually resulted from or fed process. Classifying studies relative to *accomplishment* was also problematical. In the field, valued *accomplishments* were transformed into *capacity* and

served as fuel for further development of *process*. For example: successful products inspired further investment; effective alignment of organizational components with environmental forces contributed to greater organizational performance; and improved group processes fueled more effective decisions. Because of the fluidity of performance across aspects, finding studies that fit one and only one cell proved difficult. In short, the expanded and more clearly defined Multidimensional Performance Matrix proved insufficient

The classification difficulties we encountered resulted primarily from the divergent character of the three aspects of performance and their relationship to time. While *process* exists in time and *capacity* evolves through time, *accomplishment* is an end state and the means by which performance is ultimately measured. Although all three of the performance aspects can be considered performance variables; *accomplishment*, by definition, is necessary to the measurement of performance improvement. "Performance improvement can only be manifest through outputs" (Swanson, 1998, p.8). All the studies we categorized incorporated some measure of performance by specifying outcomes or accomplishments. Therefore, accomplishment was not useful in differentiating among studies. For this reason, we did not include a category for *accomplishment* in the classification scheme.

We also assumed that *accomplishment* was necessarily preceded by activity or *process*. "Performance cannot be described or improved without specifying its determinants, accounting for the sophisticated processes through which performance is expressed... and making some judgment about whether or not performance has, in fact, improved. (Swanson, 1998, p.1-8). This is the *process* to *accomplishment* flow that is central to a generic systems model of the organization. Because we assume that this link exists in every study of performance, we did not use it as a category for classification. The reverse *accomplishment* to *process* link, however, could be of interest in studies that examine the feedback of results related to *accomplishment* and used to fine-tune process. Most of the studies we classified were primarily differentiated by their focus on *capacity* or *process* or some combination of the two.

As a result of the discoveries made in our literature search, we categorized the representative studies as single or multi level in focus and as oriented toward *process* or *capacity* or one of the relationships between *capacity*, *process*, and *accomplishment*. The results are shown in table 2.

This multilevel, multiaspect classification scheme is a more accurate representation of the performance research stream than the original framework proposed by Sleezer, et al. (in press). The expanded matrix includes multilevel studies (shaded rows) and multiaspect studies (shaded columns). The studies shown in dark shading with white lettering capture both multiple dimensions. Of the 35 studies shown, 18 are single level and single aspect, 4 are multilevel and single aspect, 8 are single level and multiaspect, and 5 are both.

Given the fit of studies in the matrix, three observations can be made. First, single-level research is common not only in the micro fields but also in the fields of organization theory and strategy. Second, *capacity* is a performance aspect that is supported by research. Third, the reciprocal link between *process* and performance is well-represented by research.

A New Model Emerges

Our review of the research indicated a need to revise the performance matrix. Once we realized that performance research could not be neatly classified by a singular aspect or level, we also discovered that the links between the aspects required a closer look. Clearly *process* shares direct and reciprocal relationships with both *capacity* and *accomplishment*. Organizations that learn by doing use processes that build capabilities as well as produce output. However, the nature of the relationship between *capacity* and *accomplishment* is not direct. *Capacity*, as defined in our model, is a reservoir of potential capabilities that must be put into action to produce output. Capabilities are unleashed through *processes* which serve as a mediator between *capacity* and *accomplishment*. If we accept that learning is an activity-based process, then we accept also that *process* is a mediator from *accomplishment* back to *capacity*. Without process intervening, there is no direct relationship between *capacity* and *accomplishment*. In this way, process becomes the dynamic center of our revised model shown in Figure 1.

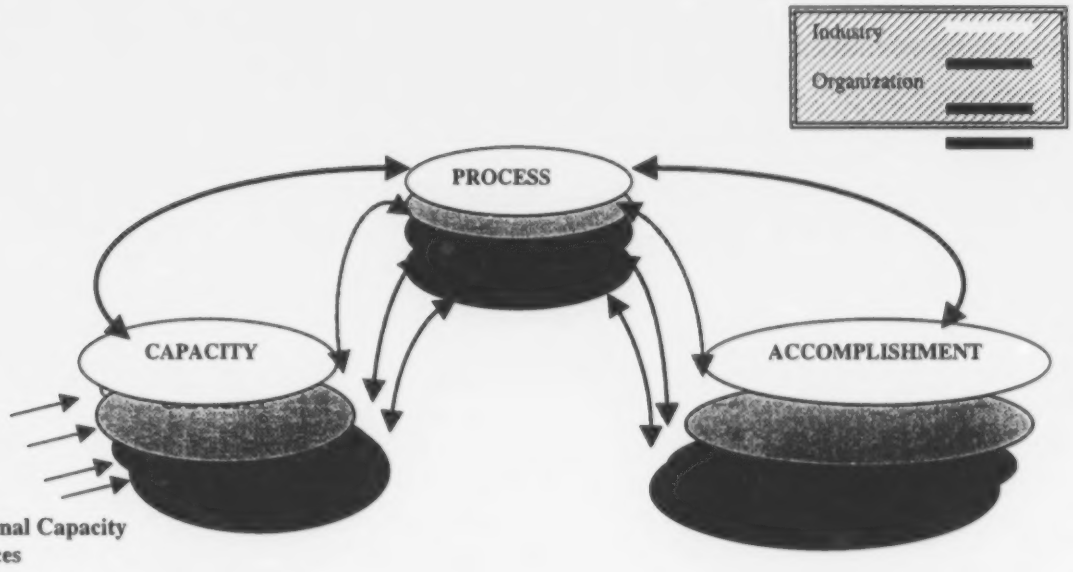
Figure 1. A Multidimensional Model of Performance



This graphic is overly simplistic in several ways. First, in addition to the arrows showing interrelationships within levels, there should be additional arrows between each aspect at one level and the adjacent aspect at every other level. We have omitted these to keep the figure readable. Second, the layered ellipses showing the levels should be understood to represent aggregates of units of progressively larger numbers. If the top ellipse represents a single industry, then the second ellipse represents the aggregate of several organizations in that industry, the next ellipse represents the collective groups within each organization, and the ellipse at the bottom represents the collection of individuals comprising those groups. To represent the true complexity of this concept, each level should be represented by increasingly more ellipses connected with interrelationship arrows within and across levels. The top most layer in the graphic must be understood to contain the most complexity in terms of numbers of sub-units and interconnectivity. The single arrows pointing into the capacity aspect at each level represent the composite of capacity components that come into organizations from the outside. This composite includes such elements as financial and human capital, investment by stockholders, technology, and regulatory concessions.

Implications for Scholars and Practitioners

Historically, the performance improvement field has been more grounded in practice than research (Sleezer 1991) and has suffered from a myopic focus on individual and group levels to the detriment of a more macro level view. The result of this situation has been a proliferation of practical models of performance in the absence of well-grounded theory (Swanson, 1998). On the macro side of organizational studies, there is a vast body of research on organizational performance motivated by the fundamental question, how does a firm establish sustainable competitive advantage? Strategists and organizational theorists have based their assumptions primarily on the traditions of industrial economics with its theoretical focus and seeming disinterest in practice (Conner, 1991). If performance improvement professionals can be said to suffer from myopia, then strategists are equally disabled by an inability to see things close at hand

Our primary purpose in this paper is to take a step toward bridging this gap by creating a performance model that integrates the micro and macro perspectives. The opportunity for such an effort is particularly ripe at this time due to the concurrent calls for a more comprehensive theory of performance in HRD (Torraco, 1998; Swanson, 1998; Holton, 1998) and the acknowledgement by strategists supporting a resource-based view of the firm that idiosyncratic human capital is critical to organizational success (Barney, 1991; Reed & Defillippi, 1990). We seized this opportunity by adapting a performance model from HRD (Sleezer, et al., in press) that proposed *capacity* as a

critical performance component and expanded it to include the industry level. We then defined the *capacity* aspect of performance in a way that incorporated both the HRD and strategic views of human capital.

Our second purpose was to extract examples from the literature that could bring the model to life. This research review led us to several significant discoveries related to model dynamics. The Multidimensional Performance Model that emerged can serve as a springboard for exploring both macro and micro perspectives from different fields. Performance improvement professionals who previously were familiar only with research from the HRD perspective may become interested in work from the strategy literature such as that of Eisenhardt (1989) and Robertson, Swan and Newell (1996). These studies not only offer a macro perspective but also tackle the difficult problems presented by multilevel research while exploring the dynamic interrelationship between *process* and *capacity*.

The incorporation of *capacity* into the Multidimensional Performance Model also gives organizational learning a specific place in the performance equation. Numerous research questions arise from the construct of *capacity* and its relationship to learning and performance. For example, how is learning captured at the multiple levels in the organization? What processes come into play in the transfer of learning from one level to another? What processes are necessary for the application of learning to enhance accomplishment? Do groups learn in the same way as individuals or are there collective processes that are unique to group cognition? (e.g., Weick & Roberts, 1993).

Finally, by specifying levels, the Multidimensional Performance Model also brings levels issues to the forefront. Many questions related to these issues remain unexplored by performance improvement researchers. For example, what isomorphisms exist between processes and constructs that are well understood at the individual level and similar processes at progressively higher levels of collectivity? Several of the studies reviewed here explore well-established individual processes at the collective level such as goal-setting and collective efficacy (e.g., Latham, Winters & Locke, 1994; Prussia & Kinicki, 1996; Pritchard, et al., 1988). Many of the studies reviewed also offer new ways to measure performance across levels that performance professionals could use to justify lower level interventions (e.g., Dean & Sharfman, 1996; Walsh, Henderson & Deighton, 1988, Nutt, 1990). Still others suggest creative ways to fortify qualitative measures with quantitative ones that lend credibility to results for both practitioners and theorists (e.g., Eisenhardt, 1989; Damanpour & Evan, 1984).

Conclusion

The tendency of the performance improvement community to use a "single lens" in developing research and interventions leaves us in a difficult position. No matter how well we perfect our intervention techniques and measurement models, we find ourselves struggling to justify the impact of our efforts on the organization as a whole. One way to fill this gap is to carefully examine the links among individual, group, organization, and industry levels and the links across the *process*, *accomplishment*, and *capacity* aspects of performance. By analyzing these links and their direct, measurable effects on critical outcomes at the organizational level within the competitive environment, broader insights become available.

The Multidimensional Performance Model presented in this paper can be used as a framework for expanding our vision. It is a dynamic, comprehensive model that encompasses all levels of performance critical to organizational success. It also specifies *capacity* as an aspect of performance that ties the field of organizational learning to the resource-based view of the firm proposed by scholars in the field of strategy. When the near-sightedness that has characterized performance studies in HRD and the far-sightedness common to studies in organization theory and strategy come together, the result is a significant improvement in vision across the spectrum of performance improvement research and theory.

Contributing Factors to the Success of Women and People of Color in Leadership Roles: A Message to HRD Professionals

Jean R. McFarland
G.P. Morgan & Associates

Gary Leske
Caroline S. V. Turner
University of Minnesota-Twin Cities

Non-white males (NWM), non-white females (NWF), and white females (WF), identified by their peers as leaders in the field of education, were surveyed by telephone interviews and mail questionnaires to learn whether they experienced barriers to advancement into leadership positions and, if so, the strategies they used to overcome those barriers. Respondents credit family, peer, and mentor support and give suggestions to other women and people of color and to HRD professionals for enhancing advancement.

Keywords: Leadership, Gender Diversity, Cultural Diversity, Training

This study of women and people of color in leadership roles is of those in vocational education; however, it could be of women and people of color in any professional arena, and the results can be applied to industry and service organizations as well as education.

Problem Statement

Studies continue to report underrepresentation of women and people of color in administrative and leadership roles in the field of education and, particularly, in vocational education (Darden, 1991; Leonard & Papa-Lewis, 1987; Marshall, 1984; Troupe, 1993; Young, 1991). In addition, as noted by Troupe (1993), "oversight by the research community for vocational education has created a void in research studies and current statistical data on people of color. . . . New studies are long overdue. . . . Significant data that are current and complete are not available" (p. 3). Troupe's research identified only sixty-one African-American state-level administrators nationwide and called for more new studies examining underrepresentation of people of color.

Theoretical Framework

This work can be viewed in the light of communication, culture, and contingency theories. Theories of communication and culture are intertwined and cannot be separated. The most basic communication theory states that the message received by an individual is not the same as the message that was sent to the individual. The difference is primarily due to interpretation within the perspective of the recipient. If people of different cultures are added to this same communication model, additional and different perspectives are automatically included, multiplying the opportunities for misunderstanding, misinterpretation, and miscommunication of messages. This, in turn, contributes to malfunctions within the contingency theory. Contingency theory concerns organizational structure and the fit of substructures into the organization as well as the fit of the organization in its environment. The following literature review demonstrates that misunderstanding, misinterpretation, and miscommunication stemming from cultural differences (whether due to gender, race, or ethnicity) can lead to overlooking good, perhaps exceptional, "fits" of qualified people for organizational roles.

Literature Review

It appears that women and people of color face similar barriers in their advancement to leadership positions, but several facilitators for their advancement are also reported.

Barriers to Advancement

Women and people of color experience both external and internal barriers to advancement, but external barriers appear to be far more significant than internal barriers. External barriers are organizational, referring to "those environmental variables that may mediate entrance into the administrative hierarchy" (Leonard & Papa-Lewis, 1987, p. 195). Internal barriers are "those that are psychological in nature and that are aspects of the personality, values, and attitudes of the individual" (p. 195). Although external and internal barriers are clearly interactive, the greatest differences among barriers appears to be within the internal barriers, those that are psychological in nature and are the result of socialization.

Internal Barriers

The internal barriers identified for women were *role conflict* (Adkison, 1981; Bowers & Hummel, 1979; Darden, 1991; Metzger, 1985; Morrison, 1992), *limited career aspirations* (Johnston, Yeakey, & Moore, 1980; Pottker & Fishel, 1977), *low self-image* and *lack of self-confidence* (Grengg & Thompson, 1982; Hennig & Jardin, 1977), *fear of success, lack of aggressiveness,* and *unwillingness to take risks* (Cottrell, 1976; Gross & Trask, 1976; McMillan, 1975; Schmuck, 1975).

Only two of the above internal barriers were identified for people of color: *role conflict* (Adkison, 1981; Alexander & Scott, 1983; Nieves-Squire, 1992; Ortiz, 1982; Shivers, 1985) and *lack of self-confidence* (Young, 1991). However, several additional internal barriers were identified for people of color: *lack of organizational savvy* (Morrison, 1992; Valerde, 1980; Young, 1991), *ineffective communication skills* (Young, 1991), *insufficient education* (Valerde, 1980; Young, 1991), and *inappropriate focus on issues of race and ethics* along with *hypersensitivity* to these issues (Young, 1991).

External Barriers

The literature indicates that external barriers--those that are present in the environment--are far more significant than internal barriers. Morrison (1992) stated, "The most significant barriers today are the policies and practices that systematically restrict the opportunities and rewards available to women and people of color" (p. 33). The external barriers faced by women and people of color were identified as lack of commitment to and enforcement of *sex- and race-equity policies* (Marshall, 1984; Morrison, 1992; Murphy, 1988); *lack of access to informal networks* (Baugher & Martin, 1991; Leonard & Papa-Lewis, 1987), *stereotypes* held of women and people of color (Adkison, 1981; Murphy, 1988; Shakeshaft, 1987; Terborg, 1977), *white-male values and attitudes* towards these groups (Baugher & Martin, 1991; Darden, 1991; Marshall, 1984), *lack of role models, mentors,* and *sponsors* (Baugher & Martin, 1991; Morrison, 1992), *tokenism* (Kanter, 1975; Ortiz, 1982), *lack of opportunities for leadership preparation* (Grengg & Thompson, 1982; Morrison, 1990), *lack of support networks* (Jones & Montenegro, 1983; Murphy, 1988), and *infighting* (Morrison, 1991). One additional barrier was identified for women: *sex-typing of jobs* (Brown, 1979; Kanter, 1975; Marshall, 1984). Also, the literature noted that women of color face the especially difficult situation of suffering the barriers for both groups, the "double whammy" of sex and race discrimination.

Facilitators for Advancement

Many more barriers were noted in the literature than facilitators. The facilitators were almost always general in nature. Hence, the facilitators are simply presented here in list form:

- Changing hiring policies (Shakeshaft, 1987).
- Developing and providing mentors, sponsors, and role models (Alexander & Scott, 1983; Marshall, 1984; Shakeshaft, 1987).
- Placing women and minorities in positions of power (Shakeshaft, 1987).
- Providing access to relevant training programs (Alexander & Scott, 1983; Jones & Montenegro, 1983; Leonard & Papa-Lewis, 1987; Marshall, 1984; Shakeshaft, 1987; Troupe, 1993).
- Developing personal and social supports (Alexander & Scott; 1983; Jones & Montenegro, 1983; Marshall, 1984; Shakeshaft, 1987; Shivers, 1985).
- Identifying clear criteria for success and making it known in the organization (Marshall, 1984).
- Implementing affirmative action laws (Oklahoma State Department, 1975; Shakeshaft, 1987).
- Obtaining experiences to prepare women for leadership (Oklahoma State Department, 1975).
- Being the best qualified for the job (Murphy, 1988) or developing impeccable interpersonal and technical skills (Alexander & Scott, 1983).

BEST COPY AVAILABLE

- Having extraordinary effort recognized and rewarded (Murphy, 1988).
- Having formulated specific strategies for advancing goals (Alexander & Scott, 1983).
- Having participated in team sports when children (Hennig & Jardin, 1977).

Some of the best facilitators are personal characteristics and skills. African-American women administrators in California community colleges stated that personal characteristics and skills necessary for successful administrative careers are self-confidence, fairness and objectivity, decision-making skills, intelligence, flexibility, organizational ability, good health, conceptual skills, patience, humor, interpersonal skills, enthusiasm, and communication skills (Shivers, 1985). Alexander and Scott (1983) noted that the most frequently reported personal characteristics of successful African-American female administrators were unwaning self-determination; willingness to dream and share those dreams with people who can turn them into reality; willingness to take risks; and viewing work as a career, not just another job.

Purpose Statement and Research Questions

The purpose of this research project was three-fold: (1) to identify successful women and people of color who are presently in administrative and leadership roles in vocational education, (2) to identify barriers to attaining those roles as experienced by study participants, and (3) to identify strategies by which study respondents overcame barriers to attaining positions of leadership in vocational education. To address these purposes, the authors had to determine (1) the barriers, if any, individuals overcame to become leaders, (2) the strategies used to overcome barriers, (3) assistance and support, if any, provided to women and people of color along their career paths, and (4) subjects' suggestions for enhancing advancement of women and people of color into leadership and administrative roles.

Methodology

Two data gathering strategies were used in this project: telephone interview and mail survey. This article presents the mail survey portion of the project.

Questionnaire Development

Information from the literature review and preliminary analysis of the telephone interview data was used for questionnaire item development. The draft questionnaire was evaluated for face and content validity, completion time, and interpretation and comprehensibility by a five-member advisory panel representative of the population. Following revisions based on their feedback, the instrument was field tested with volunteer members of a graduate-level class concerning two-year post-secondary institutions. Twenty persons completed the questionnaire and provided feedback and time estimates.

Sampling

Those invited to participate were nominated by their peers in the field. Thus, leaders were recognized as such by persons in national- and state-level positions in vocational education. Nominees then nominated others whom they considered leaders in vocational education, resulting in second- and third-tier nominations. This process facilitated location of 320 white women and people of color who are leaders in vocational education. Because a few nominations were incomplete, only 308 nominations could be used.

Sample

Surveys were mailed to the 230 people who were not part of the telephone interviews. Four surveys were undeliverable. Of the 226 delivered questionnaires, 161 (71.2%) were completed and returned. The demographic data indicated that these individuals were primarily in administrative roles.

Data Analysis

Data from the surveys were entered into an SPSS computer software program and, in keeping with the usual analyses of a descriptive study (Babbie, 1986), were analyzed for means and frequencies.

Results

The major sections that follow are related to the research questions. From the data, a profile of the respondents was compiled that indicates their overall demographics, perspectives of leaders and success, organizational barriers to leadership development, personal strategies for overcoming barriers, organizational facilitators, and suggestions for enhancing leadership development.

Demographics

A general overview of the respondents revealed a profile of married men and women over forty-five years of age who are highly educated and primarily white females or African-Americans. A closer analysis, however, identifies these groups as non-white males (NWM), white females (WF), and non-white females (NWF). Interesting similarities and differences exist among the groups.

For example, a higher percentage of NWM (78.6% of 14) over 45 years of age are in leadership positions in vocational education than are either WF (58.1% of 105) or NWF (58.8% of 34) over 45. Of the non-white respondents, 64% of males and 47% of females are African-Americans. At least 50% of each group have a master's degree and at least 32% of each group have a doctorate degree. The majority of NWM (78.6%) and WF (59.0%) are married compared to 38% NWF.

Perspectives of Leaders and of Success

Just as respondents' demographic and workplace backgrounds are needed to provide context for the results of the questionnaire, so are their perspectives of the attributes of leaders, definitions of success, and critical factors that contributed to their becoming leaders.

Leaders

When asked for their definitions of leaders, differences and similarities occurred among the groups, but primarily differences were between men and women, rather than among ethnic or racial groups. From a list of 35 descriptors of leaders, 93% of NWM chose *resourceful*, *honest*, and *competent* as descriptive of a leader. These were followed by *supportive* and *effective* (86%). The most frequently chosen descriptors by WF were *articulate* and *communicator* (87% each), closely followed by *supportive*, *competent*, and *visionary* (85.7% each). Non-white females also chose *articulate* most frequently (91%), followed by *supportive* and *honest* (88%). In comparison, *articulate* was selected by only 64% of NWM. In this case, differences were among males and females, not among ethnic or racial groups.

Success

From a list of eight phrases for defining success, respondents from each group most frequently selected the phrase *personal fulfillment*. White females (58%) and NWF (53%) were in greater agreement, however, than NWM (36%). Only NWM indicated another popular choice, with *helping others* ranked first choice by 29%. Again differences were by gender.

Contributors to Success

A list of 18 critical contributors to success was generated from responses to the phone interviews. In general, WF demonstrated higher levels of agreement on the descriptors than did the other groups. White females' most frequently identified contributor to success was *education* (86%), and the most frequently identified contributor of NWF was *determination* (74%). NWM (71%) added *self-esteem* to tie three descriptors as the most critical contributors to their success: *education*, *determination*, and *self-esteem*.

For both groups of females, *family upbringing* was included in the second-highest level of agreement (WF, 83%; NWF, 71%). Among WF, *self-confidence* tied with *family upbringing*, and among NWF, *education* tied with *family upbringing*. *Self-esteem* earned the third-highest level of agreement (68%) among NWF. *Determination* was third (81%) among WF. Clearly, all subgroups view *education*, *determination*, and *self-esteem* as critical contributors to their success.

Organizational Barriers to Leadership Developments

Respondents perceived most of the barriers to their advancement into leadership positions to come from within their organizations and to be differentially posed to NWM, WF, and NWF.

Barriers Respondents Overcame

From a list of 16 barriers (Table 1) generated from responses to the phone interviews and from the literature, NWM indicated that *racial discrimination* is the greatest barrier posed by their work organizations, 86% (n=14) noting this barrier. Non-white females indicated *racial discrimination* and *lack of network system* as their greatest barriers, 41.2% (n=34) noting each of these barriers. The *lack of networking system* also is a significant challenge to NWM (50%) and WF (41.9%). White females reported *gender discrimination* as the greatest barrier posed by their work organizations. However, this barrier was not reported by NWM and was ranked 13th by NWF, based on percentage of respondents who indicated it is a challenge.

The second most frequently reported barrier by WF (53.3%) was *family responsibilities*; it was the fifth most frequently reported barrier by NWF (25.4%), and the tenth by NWM (14.3%).

Personal Strategies for Overcoming Barriers

As would be expected of leaders, respondents took the initiative to develop their skills and prepare themselves for advancement. They chose two courses: higher education and leadership development opportunities.

Pursue Further Education

Respondents were asked to rank 12 strategies for overcoming barriers to advancement of women and people of color--at least 61% of each group responded. The first-choice strategy implemented was *sought further education*. Other choices offered were *networked, worked harder, became more visible, sought other opportunities, reapplied for positions, attended self-improvement seminars, sought mentors, waited for another opportunity, redefined career goals, relocated, and sought career counseling*.

Develop Leadership Skills

Most respondents actively worked to develop their leadership skills by attending leadership courses and workshops/seminars; conducting leadership workshops/seminars; and assuming leadership roles in professional, work, and community organizations. High percentages of all groups attended workshops/seminars (86-97%). Over 91% of the women used that method to develop their leadership skills.

All respondents of each group answered the question about activities they had undertaken to develop their leadership skills. Very high percentages (74-94%) from each group are active in leadership roles in professional, community, and work organizations. Women, particularly, assume leadership roles in their work organizations: 91% of WF and 94% of NWF. These exceptionally high percentages reflect women's strategies to overcome organizational barriers to advancement.

Table 1. Rank Order of Challenges Overcome by Respondents in Each Group

NWM (n=14)	*%*	*WF (n=105)*	*%*	*NWF (n=34)*	*%*
Racial Discrimination	85.7	Gender Discrimination	70.0	Lack of Networking System	41.2
Lack of Networking System	50.0	Family Responsibility	53.3	Racial Discrimination	41.2
Too Few Openings	50.0	Lack of Networking	41.9	Too Few Openings	38.2
Cultural Discrimination	42.9	Too Few Openings	40.0	Lack of Mobility	29.4
Too Few Role Models	42.9	Conflict with Spouse Career	31.4	Family Responsibility	29.4
Lack of Influential Mentor	35.7	Too Few Role Models	31.4	Age Discrimination	26.5
Lack of Mobility	28.6	Lack of Mobility	28.6	Cultural Discrimination	26.5
Age Discrimination	21.4	Insufficient Education	23.8	Conflict with Spouse Career	23.5
Insufficient Education	21.4	Lack of Influential Mentor	22.9	Too Few Role Models	23.5
Family Responsibility	14.3	Age Discrimination	21.9	Lack of Self-Confidence	17.6
Lack of Self-Control	7.1	Lack of Self-Confidence	19.0	Fear of Success	17.6
Gender Discrimination	0.0	Lack of Assertiveness	13.3	Lack of Assertiveness	17.6
Parental Discouragement	0.0	Fear of Success	9.5	Gender Discrimination	15.0
Fear of Success	0.0	Parental Discouragement	6.7	Lack of Influential Mentor	14.7
Lack of Assertiveness	0.0	Racial Discrimination	1.9	Insufficient Education	14.7
Conflict with Spouse Career	0.0	Cultural Discrimination	1.9	Parental Discouragement	2.9

Organizational Facilitators of Leadership Development

Many respondents reported that their organizations have implemented culture (53-67%) and gender (46-67%) diversity appreciation programs, but perceptions vary as to whether their administrators value diversity and whether the programs are successful.

One criterion by which respondents judge the success of their organizations' diversity appreciation programs is whether the organizations employ more NWM and NWF in administrative and leadership roles than were in those roles five years before. Overall, the groups were negative about an increase of NWM (59-71%) and NWF (50-79%) in these roles. All groups (63-79%) perceived more WF to be in leadership roles than had been five years before.

In assessing their administrations' valuing of diversity, respondents, overall, produced means of 3.1 to 3.4 on a scale of one to five where one equals *not at all* and five equals *very highly*. The response distribution implies that respondents perceive some valuing of culture and gender diversity. These results correspond to respondents' general lack of enthusiasm when asked if they perceived more women and people of color in administrative and leadership roles now than were five years before.

In view of the data on valuing diversity, the data on respondents' perceptions of their organizations' success with these programs are not surprising. Overall, on a scale of one (not at all successful) to five (very successful), the highest concentration of votes by respondents from organizations that have already implemented valuing diversity programs indicate that respondents perceive their organizations' success with the programs to average between 2.8 and 3.1, moderately successful.

Respondents were given a list of possible factors that account for the success of their organizations' diversity programs: *administrative support, recognition of problem(s), implementation of program, program attendance*, and *voluntary attendance*. They were asked to rank the success factors on a scale of one (most important) to five (least important). Overall, *recognition of problem(s)* and *administrative support* were ranked as either first or second in importance by all subgroups, and *voluntary attendance* was perceived as least important for success.

Respondents also addressed reasons for failure of diversity programs. The highest-ranked reason was *lip service, but no action*, on a scale of one (most important) to five (least important. Other reasons addressed by respondents were *programs not backed by administration, organization members do not recognize the problem*, and *organization members did not attend programs*. This last reason was perceived as least important. This data complements the data on factors for success where voluntary attendance was also viewed as least important.

Respondents' Suggestions for Enhancing Advancement. Respondents were asked to rank five suggestions for enhancing advancement of women and people of color into administrative and leadership roles. All groups ranked *networking* and *mentoring* as their highest choices. *Mentoring* was the most frequent first choice of WF. Interestingly, higher percentages of each group either mentor or support others than have been mentored or supported themselves. From 71-86% mentor or support others in the field of vocational education. It is worth noting that the numbers of mentors inside and outside the field are basically equal.

Respondents' perceptions of the suggestions for advancing women and people of color into administrative and leadership roles relate to the strategies they have successfully used to overcome organizational barriers--seeking further education and developing leadership skills. Nonwhite males emphasize *internships, valuing diversity training*, and *leadership training* in addition to *networking* and *mentoring*; whereas, NWF and WF emphasize *leadership training* in addition to *networking* and *mentoring*.

In addition to ranking suggested strategies for overcoming barriers, respondents provided open-ended suggestions that fell into sixteen categories (see Table 2). In general, the suggestions are consistent with other responses; however, one unique item is the suggestion of cultural diversity and equity training for *administration* and *staff*. The respondents basically are advocating strategies they have utilized, but appear to believe awareness development remains important to advancement of women and people of color.

Conclusions and Limitations

Family responsibilities (WF, 53%) and discrimination remain barriers. White females reported gender discrimination was their greatest challenge, and NWF and NWM reported racial discrimination was their major challenge.

Participants identified strategies they have used to overcome barriers and recommended additional strategies to be used.

Strategies Used.

Seventy-four percent or more of respondents assumed leadership roles in professional and community organizations in an effort to develop their leadership skills. Even more, 86%, reported that assuming leadership positions in their work organization was a strategy for overcoming barriers to leadership positions.

Strategies Recommended.

Most of the recommended strategies for increasing the number of women and people of color in leadership positions were addressed to organizations. The most frequently stated suggestion urged administration's support of mentoring.

Mentorship is viewed as a good source of knowledge for the roles sought and a means of becoming aware of leadership development options. The WF surveyed most frequently chose mentoring as their first choice of five strategies, which included *networking, internships, valuing diversity training*, and *leadership training*.

Cultural diversity and equity training for administrators and staff were the second most frequently suggested strategies by the survey respondents. The organization's understanding of its norms and values is part of the clarification needed to facilitate moving forward to address existing barriers.

Table 2. Suggestions for Advancing Women and People of Color into Leadership Roles

Suggestions For HRD	*Suggestions For Women and People of Color*
Provide cultural diversity/equity training for administrators and staff	Seek opportunities to show your talents
Provide administrative support that encourages mentoring	Develop self-confidence
Provide grooming for leadership roles	Participate in internships
Encourage support systems	Be assertive, not aggressive
Provide role models	Seek additional education in the field
Provide opportunities to demonstrate skills	Develop a good résumé
Encourage networking	
Implement leadership development programs	
Actively recruit and provide job information	
Get rid of Good Old Boys Network	
Encourage hard work	

Among the previously mentioned strategies, networking was the first choice of the NWF and NWM surveyed. Administration's leadership in *creating networks* of employees is particularly useful for increasing communication within the organization, which improves access and understanding among employees.

In addition to creating networks, administrators should *encourage cooperation, collaboration*, and *community* by providing opportunities and incentives for diverse groups of students, faculty, and/or staff to collaborate on various endeavors.

Seeking *additional education* is a commonly used strategy and was recommended by survey respondents. They suggested funding, time-off, and moral support for those seeking degrees.

A straightforward and powerful suggestion was to *recruit* more women and people of color for leadership positions. Opportunities are essential to advancement into leadership roles.

The sampling procedure might pose limitations. First, the purposive, snowball sampling technique may introduce some bias in the study. However, given the lack of statistics and information on women and people of color in leadership positions, this sampling approach was necessary.

Also, because the population of this study, successful leaders, may have dealt with the far more numerous external/organizational barriers, internal barriers for potential leaders may be under reported. It should not be inferred that interventions may not be needed in this area.

Message for HRD Professionals and Contribution to the Profession

The primary recommendation from this study is to implement the strategies suggested by the respondents. The women and people of color in this study informed us that gender and racial discrimination continue to be factors. The environment that potential leaders from underrepresented populations must confront when dealing with the barriers associated with becoming established in leadership roles varies, but remains very unfriendly for many.

Lack of knowledge and skills appears to be a fundamental challenge. Providing access to knowledge and skill development opportunities is a continuing fundamental strategy for developing more leaders from among women and people of color. However, having the basic knowledge and skills to be a leader does not diminish other barriers or strategies.

Opportunities to demonstrate leadership potential and skills are critically needed for aspiring leaders. Work and professional organizations can and must do better, but opportunities in the larger community must also be used.

Access to information about the organization, skills required, training opportunities, and leadership positions remains a barrier within organizations. Networks and mentors are among the strategies used to address this information need. Information is power. It needs to be made available to all.

This study informs HRD professionals of the external and internal barriers to leadership roles as perceived by the women and people of color who have overcome those barriers. In addition, it contributes suggestions of those same experienced leaders for developing leadership skills in others and promoting women and people of color into administrative and leadership positions. If the vision for leadership includes greater representation by women and people of color, we must pay particular attention to the fact that many of the recommended strategies for improvement are beyond the individual person's control. External barriers are difficult to change; they have to be addressed by the existing leadership and HRD professionals.

A Qualitative Assessment of Office Design Perceived by Older and Younger Workers to Impact Work

Virginia W. Kupritz
The University of Tennessee

This study examines the compatibility of office design for today's aging workforce. A cohort comparison was conducted utilizing an ethnographic method. The study identifies design characteristics perceived as facilitating and impeding work. Tentative findings indicate that both older and younger workers perceive similar design features as facilitating and impeding work. In particular, privacy needs surfaced as a primary concern of workers. Implications for human resource development (HRD) are discussed.

Keywords: Office Design, Older Workers, Qualitative

The present study attempts to inform HRD practice about office design features that accommodate the aging diversity in the American workforce. Demographic studies project that the aging population will play a significant role in the diversity of the American workforce (AARP, 1996; Brill, 1993; Hopkins, Nestleroth, & Bolick, 1991). Research to date has not examined the impact of office design on older workers; nor has research examined cohort perceptions. The research question for the present study asks: "What office design features do older and younger workers perceive as facilitating and impeding work?" Older and younger learners need a supportive work environment to help bridge the gap between the training environment and the practical work environment. The physical design of the workplace is a potential contributor to the transfer of training that is rarely examined in HRD research. HRD is in the business of improving performance. Training and development, therefore, should not take place in a vacuum for training sake; rather, it needs to occur in a larger organizational context that emphasizes the particular organization's mission and circumstances. This means that prior to setting up the training program emphasis should be placed on the organization itself, taking into account organizational issues that can impact the ultimate success or failure of the training intervention (Foxon, 1995).[1] This includes the appropriateness of the physical setting because of its potential impact on worker performance. Research examining individual, group and organizational performance documents that office design can enhance or inhibit overall organizational effectiveness (Brill, Margulis, Konar, & BOSTI, 1984,1985; Davis, Becker, Duffy, & Sims, 1985; DeMarco & Lister, 1985; Springer, 1986; Vischer, 1996). Based upon experiences since his 1984, 1985 research, Brill (1993) proposes that providing a supportive physical environment can yield a productivity benefit equal to 2 to 5 percent annual salary in all job categories.

The appropriateness of the physical setting for training transfer needs to be accommodated for in training and developing older and younger workers. It is an issue of increasing interest to HRD practitioners. An unsupportive physical environment can contribute to the failure of what otherwise may be sound training programs. For example, individuals trained to work in teams may not perform effectively when placed back into a physical environment with individual cubicles that do not accommodate teamwork. Work team effectiveness depends upon the successful management of group-organization boundaries, corresponding territorial control and a supportive physical environment (Sundstrom & Altman, 1989; Sundstrom, De Meuse, & Futrell, 1990). Conversations with a training specialist at a major university point to performance difficulties attributable to office design back on-the-job:

> In order for us within the Office of Human Resources Management to address the needs of the organization and its employees, we need to know more about the effects of the physical environment on work behavior. Quite frequently, in at least half of the [training and development] workshops I present, the discussion turns to difficulties attributable to workplace design. For instance, in a recent workshop on delegation skills, a supervisor cited her office's physical layout as an obstacle; in her opinion, the extremely open nature of the office makes it difficult to give effective feedback to employees, as other employees as well as students can hear all that is said. Similar stories, detailing the effects of physical design on routine work activities, are recounted weekly [personal communication, September 30, 1998].

Copyright © 1999 Virginia Kupritz

A supportive physical environment can contribute to successful training transfer. The physical environment is "not just a cost-center, but a benefit producer and a productivity tool that can be more purposively used" (Brill, 1993, p. 33). Sims points out that some companies are beginning to recognize the physical environment as an enabler of work processes: "The key is to integrate the physical environment with technology, management practices and work practices.
This allows employees to move where they are needed and to work where they are most productive and will be supported" (cited in Bencivenga, 1998, p. 70). For example, Hewlett-Packard and Owens Corning teamed human resource professionals with design professionals to create work environments conducive to work practices. Jakabuw oski, a workplace strategist at Hewlett-Packard, explains the company's strategy: "When most organizations are designing office spaces, they need to consider their employees—their human resources—and the way those individuals do their jobs; and that means HR professionals are, or should be, included in office redesign teams from the outset as a matter of successful business strategy" (cited in Bencivenga, 1998, p. 69).

The Aging Workforce

Demographic studies project that the aging population will have a significant impact on the diversity of the American workforce. The American Association of Retired Persons (AARP) projects that the most rapid increase in population growth will occur between the years 2010 and 2030, when the "baby boom" generation reaches age 65 (1996). The median age of the workforce was approximately 35 years in 1980, 37 years in 1990, and is projected to be approximately 41 years in 2005 (Brill, 1993; see also Hopkins, Nestleroth, & Bolick, 1991).

Organizations have raised concerns about the physiological decline of the aging workforce for some time (Ashcraft, 1992; Fox, 1951; Robinson, 1983; Welford, 1976). While laboratory studies indicate some decline in cognitive functions (e.g., cognition, cognitive speed, decision-making, memory, sensory factors, and perceptual-motion), negative effects of this decline appear to be absent from job performance (Salthouse, 1982). Salthouse (1982) theorizes that this may be because of the minimal demand level of most on-the-job activities when compared to laboratory tests, and work and life experiences gained from increasing age. For example, Machado and Smith (1996) investigated the impact of certain variables on productivity of work teams (i.e., service order completion) for service technicians at Bell South. Findings determined that the teams at the top ten percent in productivity were older, had much more time on the present job, and much more service with the company than teams at the bottom ten percent in productivity. Research, also, indicates that productivity can decline with age where specific job-tasks or occupations relate to the degree and type of physical effort, such as reaction time and speed of performance (Ashcraft, 1992; Robinson, Coberly, & Paul, 1985; Sheppard, 1976). Robinson, Coberly, and Paul (1985) reviewed a number of studies on occupational performance with age, concluding that "environmental conditions are important in mitigating the effects of decline in aging workers" (p. 519). Environmental conditions provide the physical context of work place design through barriers and field characteristics. Zeisel (1984) describes barriers as the physical elements that keep people apart or join them together, physically and symbolically, through walls, screens, objects, and partitions. He describes field characteristics as the physical elements that perceptually alter the physical context through shape, size, orientation, lighting, acoustics, and air quality. Ashcraft (1992) proposes that structural changes in workplace design may need to be made to support the physiological decline that occurs for older workers. While this seems intuitively valid, the impact of design barriers and field characteristics on aging worker performance empirically has not been examined. With the increasing workforce diversity, how to accommodate office design needs to facilitate job performance for both older and younger workers, also, warrants empirical examination.

Research Methods

Twenty-four administrators participated in the study, twelve older persons and twelve baby boomers. All twenty-four administrators are actively involved in their work within the same geographic area. The older persons work for nonprofit service organizations and the baby boomers work for profit and nonprofit service organizations. Work responsibilities and tasks are similar between groups. The twelve older administrators consisted of two persons, 60-62 years, and ten persons within the age range of 64-78 years. The twelve baby boomers consisted of four persons, 50-53 years, and eight persons within the age range of 38-45 years. The present study did not include ages 50-59 in the sample of older persons as the investigator believed that the sample cohort comparison of office design needs

probably would be more pronounced by sampling higher age groups, especially in the cohort of 64+ years. (This is due to the physiological changes that occur with increasing age.)

Heuristic elicitation was utilized to interview the 24 administrators. The Heuristic Elicitation Methodology (HEM) is designed to analyze complex issues by exhausting the range of respondent perceptions concerning the variables being examined, to determine beliefs associated with the issues, and to identify interrelationships among the issues. As a cognitive ethnographic method, the basic assumption of the HEM is that it is possible to match particular items and attributes with particular cultural values (Harding & Livesay, 1984). HEM procedures help to establish authenticity through the nature and format of the questions asked, followed by content analysis techniques (see Denzin, 1978; Denzin & Lincoln, 1994; Goetz & LeCompte, 1984). HEM stimulus materials are respondent-generated and data respondent-categorized rather than investigator-generated and investigator-categorized. This preserves the language and conceptualizations of respondents and decreases the likelihood of overlooking significant attributes of a domain being examined (Spradley, 1979; 1980).

Structured interviews were conducted with each administrator over a 30-90 minute period. The structured interview is the first phase of the HEM, called the Domain Definition. The Domain Definition is an open-ended interview in which the language of the respondent is used in a series of interlinked questions, with answers recorded verbatim. Using the respondent's own language in the questions helps to establish a shared meaning of language. The HEM consists of several elicitation phases, however, any elicitation phase can be used individually and stand alone as a separate investigation (Harding, 1974). The methodology is predicated upon the idea that "language provides a powerful entry to cultural meaning structures" (Harding & Livesay, 1984, p. 75).

The Domain Definition identifies domains through semantic relationships in terms of behavior, artifacts and knowledge that people have learned or created. A "domain" is a set of categories organized on the basis of a single semantic relationship (e.g., "X" is a kind of "Y"; "X" is a way to do "Y"). The research instrument for the present study was designed to elicit information primarily about physical features followed by psycho-social features, perceived as facilitating and impeding work. The 14 questions asked avoided "referential meaning" by asking for "use" through contrast, similarity, uniqueness and the ideal in an effort to exhaust a domain (see Spradley, 1979; 1980). The following questions illustrate the nature and format of questions used in the present study:

Q. What are the different kinds of things that you do, or try to do, or try to get done in your office? [Answers = "X"]
Q. For/when "X", what conditions, or office features, or situations make it <u>easier</u> to conduct "X"? [Answers = "Y"] PROBE: What else might make it easier to conduct "X" other than "Y"?
Q. For/when "X", what conditions, or office features, or situations make it <u>harder</u> to conduct "X"?
Q. What kinds of things are important for you to be able to have in your personal office work area? [Answers= "X"] PROBE: When, at what times, or in what situations is having "X" important to you? [Answers = "Y"] PROBE: When else, other than "Y", would "X" be important for you to have in your personal office work area?

The investigator conducted a domain analysis utilizing content analysis procedures (see Spradley, 1979). This involves sorting through interview responses and identifying patterns, categories, or themes. A worksheet was developed that displayed semantic relationships. Possible cover terms and included terms that appropriately fit the semantic relationships were searched for in the data. Making systematic use of this kind of worksheet helps to uncover domains embedded in the interview responses (Spradley, 1979). Each physical item and attribute and psycho-social feature, perceived to facilitate or impede work, was represented in some domain category. Key participants reviewed the domain categories for accuracy and gave positive feedback (see Creswell, 1994; Merriam, 1988). A system of cultural meanings that older and younger workers use to denote and connote physical and some psycho-social features of the office was uncovered.

Findings

Physical Items and Attributes

Older and younger workers do not appear to differ in their perceptions about types of physical features that impact work. Elicited responses by older and younger workers indicate that similar types of items and attributes are perceived to facilitate work:

> [my office] would have up-to-date technology, meaning computer, printer, a good phone system;

would have a window;
adequate lighting;
the computer is vital, I can't imagine doing the job without it;
filing space is important, and I've added a larger filing cabinet to my space;
books, always books--I keep a supply of reference books;
larger desk with more drawers;
plenty of office space, four walls and a door;
a facility [that's] planned well for groups;
being close to the people I work with, personal interaction with coworkers is very important.
[verbatim responses by older workers]
[having] a computer, printer, etc.;
computer support; have windows--I can see windows through other spaces, so I can get some environmental clues even though it is an interior office; good lighting;
have enough space for all of the office equipment;
a place with and for reference materials;
have an area set aside just for storage;
big desk to spread things around; larger work area;
easy access to other cubes for team effort;
[being] close to my coworkers, so if I need anything, it is easy to locate different personnel;
a separate workspace for meetings and interviews that is quiet and multi functional.
[verbatim responses by younger workers]

The domain analysis revealed that the physical features mentioned most frequently by both groups as facilitating work are: up-to-date information technology; large enough workspace; close proximity to conference rooms, equipment, reference materials and supplies; windows; adequate work surface; and being near co-workers.

Elicited responses by older and younger workers also indicate that similar types of items and attributes are perceived to impede work:

my office is too small, office furniture is not adequate;

the lack of storage space that makes for a messy appearing office environment;

not having the equipment and everything we need to work with;

no windows.
[verbatim responses by older workers]

[having] the typical Dilbert cube; multiple people being in one office;
[my space is] too small, can't fit everything I need to work with, some stuff is stored elsewhere;
too small, not made for us, used to be an old lab, so we don't fit;
not enough work office, not enough room for storage, full of office equipment, no windows, etc..
[verbatim responses by younger workers]

Lack of office space, lack of storage space and lack of windows, as well as inadequate equipment appear to impede work for both older and younger workers. The individual workspace being too small was mentioned most frequently by both groups.

Privacy Issues in the Workplace

Salient psycho-social features perceived by older and younger workers as facilitating and impeding work, also, were elicited during the interviews. Psycho-social features elicited most frequently by the workers relate to privacy issues. Responses by older and younger workers indicate that similar privacy features of the work place are perceived to facilitate work:

more need for concentration time with lack of interruptions;
4 walls and a door;

no more than 1 door, so that interruptions can be kept to a minimum;
avoid interruption;
a secretary who takes our calls;
avoid outside noise;
silence;
my family pictures, every time I get frustrated I can look at them, it's a warm fuzzy;
individual office with privacy, with space I have control;
[personal workspace] big enough to meet with as many as 4 to 6 people comfortably, in private;
walls to the ceiling;
always avoid partial walls.
[verbatim responses by older workers]

being able to concentrate;
I get distracted easily, I need to be isolated;
my office is away from traffic, it is secluded;
being able to close the door;
not being bothered by the phone and the public;
no distractions;
no walk-in traffic;
room to individualize [with] pictures on the wall when you need to spend a lot of time in there;
close proximity to work area and conference rooms for meetings [to have] more privacy for support staff;
full walls;
no cubicles.
[verbatim responses by younger workers]

Responses by older and younger workers also indicate that similar privacy features are perceived to impede work:

distracting noise;
the level of noise;
voices of surrounding coworkers;
being interrupted;
interruptions by flow of traffic;
having an open door policy;
too many walk-ins;
if wanted to concentrate, have to work hard to get away from distractions;
probably the general crowding;
lack of privacy and crowding; hard to talk confidentially.
[verbatim responses by older workers]

noisy [office] because it is in the main traffic area;
noise level that interferes;
ringing telephone;
being interrupted by other people;
too convenient for people who want to kill time to stop by and kill time;
cramped; the sense of being closed in and that you couldn't swing a cat in one office;
some of the nature of the work we do should be confidential--it is tough with cubicles--and we have no formal conference area for meetings.
[verbatim responses by younger workers]

Uses of the term "privacy" in work environments generally reflect the regulation of interaction, which encompasses retreat from incoming stimulation (generated by people and environmental stimuli) and information management, that is, outgoing information (Sundstrom, 1986). The particular privacy features perceived as facilitating and impeding work in the present study are common meanings found in the privacy literature on work environments. (See Justa & Golan, 1977; Kupritz, in press; Oldham, 1988; O'Neill, 1994; Sundstrom, Herbert, & Brown, 1982; Zalesny & Farace, 1987). Being able to concentrate, being isolated, avoiding interruptions, and avoiding acoustical distractions are examples of regulating incoming stimulation for privacy. Having an individual

office with space to control and room to individualize an office with pictures on the wall are examples of the need to control and to personalize one's space. Altman (1975) theorizes that this need serves the main function of privacy, which is to help maintain a person's self-identity. Physical features such as having a door, an office away from traffic, conference space(s) for confidential meetings--either in one's own office or close proximity, and walls to the ceiling represent barriers used to regulate incoming stimulation and outgoing information for privacy. Privacy features perceived as impeding work are indicative of the common complaints about privacy found in the literature.[2]

Altman (1975) theorizes that the most basic privacy need is to optimize social contact (with both incoming stimulation and outgoing information) and to avoid crowding. Findings from Sundstrom, Town, et al. (1982) suggest that the next need may concern mental concentration and the avoidance of distraction, interruption, and noise. Where neither crowding nor concentration poses problems, autonomy and conversational privacy may become salient as the third need.

Implications for HRD

The theoretical considerations presented in the study, though still in their formative stage, provide a beginning knowledge base about office design features perceived by older and younger workers to impact work. The present study indicates that age diversity in the workforce does not appear to influence the overall types of design items and attributes and privacy features perceived to impact work. Older and younger workers perceive similar types of office features as impacting work, even with the physiological changes occurring in aging workers. Pending further research, structural changes to the office may not be necessary to accommodate older workers. This potentially can prove cost effective to organizations as they strive to support workforce diversity. For most American companies, facility-related expenses (i.e., real estate and equipment) represent the second largest organizational asset at about 25% operating costs, topped only by personnel operating costs at about 38% (Haworth, 1985; see also Becker & Steele, 1995). The study also indicates that privacy is a primary concern of older and younger workers that should not be overlooked when addressing the needs of an organization and its employees. This supports previous findings for younger to middle-age workers (Kupritz, in press). Generalizations, however, cannot be made at this time as privacy perceptions may depend upon the relevancy to the particular situation and needs of particular job types (see Justa & Golan, 1977; Kupritz, in press; Sundstrom, Town, et al., 1982).

The detail gained about cohort perceptions in this initial study warrants a larger study that measures the strength of item and attribute relationships and the relative importance given to office features by cohorts. This raises several questions. What is the strength of association between office design features and job activities performed? What weighting of importance do cohorts give to design items and attributes and privacy features perceived to facilitate work? Further studies also are needed to explore the impact of office design on informal and incidental learning for cohorts. The answers to these questions, along with the present findings, can help HRD professionals make informed decisions about the appropriateness of the work environment for older and younger workers as they practice new ways of working on-the-job. In a broader context, the present findings validate the physical environment as an enabler of work processes that offers an untapped resource for HRD intervention. Providing a supportive physical environment is an "opportunity to manifest support for the organization's purpose and learning" (Dutton, 1994, p. 469).

Footnotes

1. Studies examining the transfer of training report that the percentage of training that actually transfers is extremely low, and that much of it is extinguished over time (Broad & Newstrom, 1992; Georges, 1980; Grabowski, 1983; Kelly, 1982). Organizational issues that have been documented to impact training transfer include management and collegial level of support, availability of resources and technology to support transfer, timeliness of training
to try out new learning, training relevance, and potential application of training back on-the-job (Foxon, 1995).
2. Privacy research during the 1970's-1990's reveals that the inability to hold confidential conversations, lack of control over accessibility, the inability to avoid crowding, lack of autonomy over supervision, and distractions and interruptions can contribute to negative effects on job performance and satisfaction (Sundstrom, Burt, & Kamp, 1980).

Consequences of Part-time Work for Full-time Coworkers: Procedural Fairness in Human Resources and Employee Reactions

Shannon L. Palmer
University of Maryland

The effects of part-time work on full-time coworkers have not been fully investigated in the part-time work literature. Drawing on the fairness literature, this study explored relationships between having a part-time colleague, general and procedural fairness, workload, colleague availability, and part-time work advocacy. Implications for part-time work in organizations are discussed.

Keywords: Procedural Fairness, Work and Family, Employee Reactions

Alternative work schedules are increasingly common in the United States. Between 1982 and 1992, the number of temporary workers employed in U.S. organizations grew from 400,000 to 1,456,000 (Ansberry, 1993). Additionally, 24% of the new jobs created between 1992 and 1993 were part-time positions (Ansberry, 1993). Both employees and organizations acknowledge a growing need for the staffing flexibility offered by alternative work schedules, in particular, by part-time work arrangements (Goodstein, 1994; Pfeffer & Baron, 1988).

Voluntary Part-time Work: Effects on Part-time Employees

Past research in this area has concentrated almost exclusively on the effects of voluntary part-time work on the part-time employee (Barker, 1993). Overall, studies suggest that while part-time work may improve the part-time employee's home life by increasing flexibility in scheduling and by reducing the workload and role conflict experienced by the part-timer (Olmsted & Smith, 1989), people who choose to move from a full-time to a part-time work arrangement may be denied promotions, pay raises and may experience decreased autonomy, lowered career and personal satisfaction, and weakened connections to social networks in the work place (Barker, 1993; Negrey, 1993; Perlow, 1995; Powell & Mainiero, 1992).

Thus far, researchers have paid relatively little attention to the broader implications of voluntary part-time employment for the full-time coworkers of part-timers and for the organization as a whole. Results from three recent studies suggest that working with a formerly full-time, now part-time employee can have negative effects on full-time coworkers' career mobility, trust in the organization, and job satisfaction. By studying 15 years worth of career planning data for clerical workers at a large utility company, Barnett and Miner (1992) found that working with a temporary coworker can inhibit certain types of job promotions and career mobility of full-time workers, as compared with coworkers of solely full-time employees.

Pearce (1993), testing a sample of 223 employees and short-term contractors at a large aerospace company, found that full-time employees' trust in their organization is lower if they work with temporary workers than if they work only with full-time employees. In a similar vein, Davis-Blake (1994), using a national sample, found that the presence of permanent part-time employees is associated with lower levels of organizational commitment among their full-time coworkers. These studies have established the possibility that full-time coworkers of part-time employees may be more dissatisfied than the coworkers of solely full-time employees.

My goal in this study was to further explore the effects of part-time work policies and procedures on the full-time colleagues of part-time employees. I drew on the fairness literature – more specifically, on procedural justice theory -- to investigate the consequences of part-time work policies and practices for full-time employees working with part-timers, as well as full-time employees' reactions to such policies and practices.

Procedural Justice Overview and Empirical Research

A substantial body of research exists which explores the relationship between how organizations treat their employees and how employees perform for their organizations (e.g., Adams, 1965; Grover, 1991). Many researchers have concluded that fairness, or justice, is an important explanatory link in this relationship, and that concerns over organizational fairness arise with some frequency in the work place (e.g., Sheppard, Lewicki, &

Copyright © 1999 Shannon L. Palmer

Minton, 1992). Sheppard, et al. (1992) identify those situations that call for organizations to make and apply policies and procedures as most likely to evoke employee concerns for fairness.

The procedural justice literature may be especially helpful in fully explaining how fairness perceptions and other attitudes surrounding part-time work issues are influenced. Procedural justice refers to the process or procedures by which organizational decisions or outcomes are reached (Sheppard, Lewicki & Minton, 1992), and many studies have shown that procedural justice plays a key role in determining employees' perceptions of fairness in the work place (e.g., Barrett-Howard & Tyler, 1986; Konovsky, Folger & Cropanzano, 1987). Several distinct facets of procedural justice have been identified and explored by previous researchers (Leventhal, 1980; Thibaut & Walker, 1975; Tyler & Bies, 1990). Leventhal (1980) identified six procedural rules which are critical to perceptions of procedural fairness: consistency of decisions, bias suppression, accuracy of information used in making decisions, representativeness of the interests of all involved groups in decisions ("voice"), and meeting ethical norms by decisions. Sheppard and Lewicki (1987) found that managers do, in fact, use Leventhal's rules to determine their perceptions of procedural fairness. Konovsky, Folger and Cropanzano (1987) conclude that Leventhal's procedural justice rules are integral to explaining employee reactions to organizational decisions. A wealth of strong empirical support links procedural justice with several important work attitudes (e.g., Alexander & Ruderman, 1987). Procedural justice has been found to predict employee job satisfaction, supervisor evaluations, trust in management, turnover intentions, and organizational commitment (Alexander & Ruderman, 1987; Konovsky & Cropanzano, 1991; Sheppard, Lewicki & Minton, 1992). Given the strong empirical support behind examining decision processes, it may prove useful to investigate the effects of procedural justice in part-time work situations. Organizational policies regarding part-time work among employees, the processes by which employees are allowed to switch to a part-time work arrangement, as well as the practices by which organizations and coworkers accommodate such arrangements, may have substantial impact on full-time employees' perceptions of organizational fairness and other work attitudes.

Hypotheses

Increased Workload

Part-time work practices may affect coworkers in a variety of ways; in particular, coworkers' workload may be adversely affected. Employees are responsible for a given set of tasks or responsibilities within an organization. These responsibilities are usually divided up among the members of a work group, according to specialty or availability of the employee. Grover (1991), in a study of coworker perceptions of parental leave policies, suggests that the process of distributing the absent employee's workload may be an important consideration in determining coworkers' perceptions of fairness and other attitudes. This relationship has yet to be explored in the context of part-time work, though it seems likely that most organizations will establish formal or informal policies regarding the distribution of workload when an employee becomes part-time. In a situation in which one member of the work group reduces his or her input at work by becoming a part-time employee, some responsibilities usually handled by this employee may be assigned by the organization to the full-time employees who work closely with the part-timer. Thus, it is proposed, that, as a result of their organizations' policies and practices regarding part-time work, coworkers of part-time employees report greater workloads than do the coworkers of solely full-time employees.

Increased Colleague Unavailability

Above and beyond an increase in workload, coworkers of part-time employees may also experience a certain amount of coworker unavailability. While part-time coworkers are out of the office for a significant amount of the work week, full-time coworkers can expect increased difficulties in scheduling meetings or consultations with their part-time coworkers. The unavailability of a part-timer is also an issue when coworkers need the part-timer to provide assistance on tasks requiring the part-timer's expertise. Finally, the need for full-time coworkers to update the part-timer on work-related information which the part-timer missed on his or her days off may also contribute to the full-time employee's perception of part-timer unavailability. Thus, it is hypothesized that coworkers of part-time employees report a greater sense that their colleagues are unavailable than do coworkers of solely full-time employees.

Moderator: Size of the Work Group

The size of the work group is proposed to moderate the relationship between working with a part-time colleague and full-time employees' perceptions of workload and colleague unavailability. Among employees who work with a part-time colleague, the smaller their workgroup, the greater the full-timers' perceptions of increases in workload and colleague unavailability. If the work group is composed of only a few people (and assuming that no one is hired to pick up the extra work, which seems a likely possibility in a professional organization), it is more likely that these few remaining employees will be required to complete the work not finished by their part-time coworker. Among employees who work solely with full-time colleagues, the size of the workgroup is not expected to have such an effect on perceptions of workload and colleague unavailability. It is hypothesized that the size of the work group moderates full-timers' perceptions of increased workload and coworker unavailability.

General and Procedural Fairness

While part-time work arrangements may raise important issues for coworkers' daily lives, from a human resource perspective, it seems critical to investigate whether organizational policies and practices regarding part-time work influence employee perceptions of the organization as a whole. In an attempt to determine the extent to which employee reactions to part-time work practices affect their overall views of how fair their organizations are, employees' overall perceptions of organizational fairness will be measured. It is hypothesized, then, that among those employees who work with a part-time coworker, those who perceive the process by which the part-timer's work schedule was determined to be fair will report greater perceptions of organizational fairness than will those employees who feel the process was unfair.

Advocacy of Part-Time Work

Additionally, the effects of part-time policies and practices on full-time colleagues' attitudes toward part-time work will be investigated. It is proposed that coworkers of part-time employees will advocate the concept of part-time work among professionals significantly less than will coworkers of solely full-time employees.

Method

Data were collected from 133 attorneys at 11 private law firms. Participants were divided into two groups: those who work with at least one part-time attorney (the "part-time" group, comprised of 40 attorneys), and those who work solely with full-time attorneys (the "full-time" group, comprised of 93 attorneys). All part-time coworkers of surveyed attorneys voluntarily became part-time after working at their firms in a full-time capacity. The overall response rate was 56%; the response rate was 60% among the "part-time" group and 54% among the "full-time" group.

Perceptions of workload were measured with a 13-item scale developed by Caplan, Cobb and French (1975). Measured with a 7-point agree-disagree response scale, items include "I feel rushed during the day" and "I have a lot of downtime at work." Colleague unavailability was measured with an 8-item scale developed for this study. Using a 7-point agree-disagree response scale, items were designed to measure the daily disruptions due to part-time coworkers. A sample item is: "It is easy to coordinate my schedule with the attorneys with whom I work"(reverse-scored). A principal-components factor analysis, no rotation, extracted a one-factor solution, explaining 42.11% of the variance. The size of the work group was measured with one open-ended item: "Including yourself, how many attorneys at your firm do you consider to be in your work group?"

Perceptions of general fairness were measured with Price and Mueller's (1986) distributive justice scale. Respondents were asked to rate how fair their outcomes such as pay, workload, and assignments were for this 6-item scale. Price and Mueller's (1986) 7-item scale measuring procedural justice, including six items capturing Leventhal's rules as well as an overall item, was used to measure perceptions of whether the decision process allowing their colleague to become a part-time employee was fair. Finally, an 11-item scale was developed to measure the degree to which attorneys advocate part-time work in law firms. Using a 7-point agree-disagree response scale, sample items include, "part-time work among attorneys is a good idea for other law firms" and "Part-time work among attorneys causes more disruption than it's worth (reverse-scored). A principal-components factor analysis, no rotation, extracted a one-factor solution explaining 51.25% of the variance.

Participants' tenure at the firm, gender, and likelihood of switching to part-time work in the future were measured (from 1 = very unlikely to 6 = very likely). Participants who work with at least one part-time attorney were asked an additional set of questions pertaining to part-time work at their firms. Participants were also asked the gender of their part-time colleague, as well as their extent of knowledge of the part-timer's employment contract, measured from 1 = nothing at all to 5 = a great deal.

Results

In order to test whether consequences of part-time work for full-time coworkers were of substantial enough magnitude to warrant attention from HRD professionals in organizations, a conservative test of the hypotheses was conducted: when applicable, coworkers of part-timers were compared, as a group, to a sample of coworkers of solely full-time employees. Means, standard deviations, intercorrelations and alpha coefficients for variables are displayed in Table 1.

Table 1

Zero-Order Correlations

Scales n = 133	M	SD	1	2	3	4	5
1. Advocacy	4.91	1.17	.90	- .15	- .06	-.29*	-.02
2. Colleague Unavailability	3.09	1.02		.80	- .41**	-.16	.34**
3. General Organizational Fairness	3.99	.84			.86	.25	-.28**
4. Procedural Justice	4.17	.82				.85	-.08
5. Workload	4.63	1.05					.87

Note. Alpha reliabilities of all scales are presented along the diagonal.
*p < .05, **p < .01

A series of t-tests were conducted to investigate whether participants categorized as coworkers of either part-timers or full-timers differed in important ways. Results, found in Table 2, show that the two groups are quite similar along several demographic variables. In the combined sample, only three participants (2% of the sample) had worked part-time at some time during their careers.

Hypothesis Testing: Comparisons of "Full-time" and "Part-time" Groups

Mean perceptions of workload in the part-time group (M = 4.76, SD = 1.00) and in the full-time group (M = 4.58, SD = 1.08) were not significantly different. A significant difference was found in perceptions of colleague unavailability among coworkers of part-timers and of full-timers, in the opposite direction than predicted (PT M = 2.83, FT M = 3.20, t (92.38) = -2.12, p <.05).

A t-test revealed no significant mean differences in perceptions of general organizational fairness between the part-time group (M = 4.13, SD = .80) and the full-time group (M = 3.92, SD = .85). A simple regression conducted to test whether, among employees who work with a part-time colleague, perceptions of greater procedural justice regarding the decision to allow the coworker to become part-time is a significant predictor of general fairness was nonsignificant. Finally, no mean differences among the part-time (M = 5.16, SD = 1.17) and full-time groups (M = 4.80, SD = 1.15) were found on advocacy of part-time work.

Table 2

Demographic Comparison of Part-Time and Full-Time Groups

Variable	Part-time group M	Full-time group M	t	Sig (2-tailed)	Male %	Female %
Tenure at firm (in years)	7.93	8.40	.26	ns		
Size of work group	11.12	8.55	1.95	ns		
Likelihood of switching to part-time*	1.81	2.10	-1.03	ns		
Overall sample of respondents					65.4	34.6

*Scale measured from 1 = very unlikely to 6 = very likely.

It was predicted that work group size would moderate the relationship between the work group (made up of either all full-time colleagues or including at least one part-time colleague) on perceptions of workload and colleague unavailability such that the smaller the work group, the greater the full-timers' perceptions of increased workload and coworker unavailability, but only if the full-timer has at least one part-time attorney in the group. The interaction between working with a part-time attorney or all full-time attorneys and work group size did not significantly predict colleague unavailability, but did significantly predict perceptions of workload $t(3) = 2.20$, $p < .05$. Coworkers of part-time attorneys report larger workloads than do coworkers of solely full-time attorneys, but only when they work in small work groups with part-timers. There are no differences in perceived workload among attorneys who work with part-timers and those who work with full-timers when the attorneys belong to large workgroups.

Advocacy of Part-Time Work and Procedural Justice

Given the significant negative relationship between advocacy and perceived procedural justice of the decision to allow part-time work schedules, $r = -.29$, $p < .05$, a hierarchical regression was conducted to test whether advocacy of part-time work explains unique variance in perceptions of procedural justice beyond that explained by participants' personal interests in becoming part-time themselves. When the likelihood of the participant becoming part-time is entered into the equation first, it significantly predicts procedural justice perceptions ($B = -.22$, $p < .05$), but advocacy is no longer a significant predictor ($B = -.02$, ns). Interestingly, men are significantly more likely than women to perceive that their firm's part-time employment decisions are made fairly ($r = .52$, $p < .05$). Male attorneys are significantly less likely to switch to part-time work ($r = -.46$, $p < .05$), and though this variable was not measured, it may be that male attorneys are more involved in setting their firms' policies regarding part-time work. More involvement in decision policies and potentially less personal involvement in these issues may contribute to gender differences in perceptions of the fairness of part-time policies and procedures.

Attitudes Toward Colleague Availability: The Role of Knowledge of the Part-Time Contract

A one-item measure of how much participants in the "Part-time" group know about their part-time colleagues' contracts was significantly and negatively related to colleague unavailability ($r = -.33$, $p < .05$). Thus, among attorneys who work with part-timers, the more they know about the specifics of their colleague's part-time work arrangement, the less they report their colleagues unavailable.

Discussion

Using procedural justice theory as a theoretical framework, this study investigated the effects of organizational policies and practices regarding part-time work on the work attitudes of full-time colleagues. The results of this study offer good news for organizations considering part-time work options for their employees. Allowing part-time work schedules among attorneys seems to cause few adverse effects for full-time colleagues' work attitudes. Contrary to expectations, coworkers of full-time attorneys experienced significantly more colleague unavailability than did coworkers of part-time attorneys. It may be that part-time attorneys maintain very specific, limited work schedules which are taken into account by their coworkers. Post hoc analyses support this conclusion: the more attorneys know about their part-time colleagues' work schedules, the less unavailable they perceive their colleagues to be. It may be that the more attorneys know about their colleagues' schedules, the more they temper their expectations to fit their colleagues' availability.

Results of this study do reveal a significant moderator of the relationship between whether the participant works with a part-time attorney and perceptions of workload. Attorneys who work with part-time colleagues report greater workloads when they work in a small group with their part-time coworkers. In smaller work groups, it may be that the connection between the reduced workload of the part-timer and the increase in workload required of the part-timer's colleagues is more direct and salient than in larger work groups. In larger groups, the part-timer's work might be distributed among more employees, thus requiring a smaller increase in workload for any one colleague as a result of part-time work. This finding does provide some initial evidence that colleagues of part-time attorneys do, in fact, experience some increase in workload as a result of their coworker's part-time employment, but this burden may be mitigated by the presence of more attorneys in the work group who can help to share the load.

Colleagues of part-timers also did not experience any sense of general unfairness as a result of part-time work practices at their firms. Surprisingly, attorneys' perceptions of the procedural justice of the decision by which the part-time attorney became part-time did not influence attorneys' perceptions of general fairness. Full-time attorneys' perceptions of general fairness also seem to remain unaffected by attorneys' perceptions of their firms' part-time policies. This finding seems to suggest that full-time attorneys may not be highly concerned with the fairness of the process and policies by which their firms address part-time work arrangements, a conclusion which seemingly contradicts Grover and Crooker's (1995) finding that even employees who didn't benefit directly from family-friendly policies offered by their company were more committed to their organizations than employees at firms without these policies. Interestingly, post-hoc analyses revealed that participants who were more likely to switch to part-time in the future were significantly less likely to believe that the policies and procedures by which their firms handle part-time work decisions are procedurally fair. Taken as whole, these findings suggest that participants who have a vested personal interest in becoming part-time, beyond a general advocacy of part-time work, are more likely to be concerned with the procedural justice issues surrounding part-time employment at their firms. The lack of a direct relationship between procedural justice and general fairness found in this study may also be interpreted to mean that in situations where procedures may never apply to the participant (such as asking for a part-time work arrangement), procedures are not important in determining perceptions of general fairness. More research should be conducted before any solid conclusions can be reached on this issue.

Conclusions and Limitations

Overall, the findings of this study do not offer strong support for the influence of fairness in determining coworkers' attitudes in part-time employment situations. Working with a part-time colleague does not seem to influence attorneys' general sense of whether they are being fairly treated by their firms, nor does the fairness of part-time policies and procedures seem to affect work attitudes of coworkers. It may be that instead of interpreting part-time work situations in terms of fairness, full-time attorneys rely on Deutsch's (1975, 1985) need principle instead: they may be sympathetic to their part-time colleagues' personal needs and are willing to accommodate them (Grover, 1991; Greenberg, 1987a; de Dreu, 1996).

Some limitations of the study warrant a mention here. As a correlational study, no clear statement of causation among the variables of interest can be determined. Further, all variables were collected from a single source, which introduces the potential for response bias in this study (e.g., Williams, Cote, & Buckley, 1989). Despite some recent evidence that response bias may not have the broad, comprehensive effects on research in organizations as was once thought (Crampton & Wagner, 1994), the possibility remains that relationships among variables may be inflated in this study due to response bias. Finally, the cross-sectional data collected for this study

may not be the optimal way in which to examine the relationships described in this research. If the key to explaining the effects of organizations' part-time practices on coworkers' relevant work attitudes is the adjustment of expectations, a longitudinal study may more fully capture the organizational and psychological processes which influence full-time employees working with part-timers.

Implications for Human Resources Management

The results of this study offer good news for law firms and other professional organizations considering part-time work options for their employees. The findings of this study do suggest three potentially cautionary notes to organizations regarding the implementation of part-time policies. First, attorneys who work in small groups with a part-time colleague do notice greater workloads than do attorneys in small, "full-time" work groups. Before allowing an employee to switch to part-time work, organizations should carefully consider how the workload in that employee's group can be redistributed in a fair manner. Second, employees may be more accepting of part-time work among their colleagues the more they know about the part-timer's reduced schedule. To foster acceptance of part-time work among full-time colleagues, firms may want to explicitly address the reasons for their colleague's switch to part-time work, as well as the time limitations of the new part-time schedule.

Finally, full-time attorneys who are interested in taking advantage of part-time work options in the future do not necessarily feel that the process by which their firms allow part-time work is fair. Interested coworkers may be well aware that colleagues who become part-time find that the extent to which their firms subsequently pass them over for promotions and other career opportunities far outweighs the benefits of their part-time work schedule. Organizations should be aware that employees interested in part-time work may not be at all satisfied with the way their firms treat part-timers. If they are concerned about reaping the potential benefits of allowing part-time employment among their employees, organizations should reconsider the ways in which they implement part-time work policies, as well as the effects of part-time employment on the career development of both part-time and full-time employees.

Disability Disclosure, Recruitment Interviews, and the Employment Process

Tonette S. Rocco.
The Ohio State University

Interviews were conducted with individuals with invisible and visible disabilities about disclosure, accommodations, and employment experiences. Individuals with visible disabilities disclosed to make the recruiter comfortable, to set the ground rules, and to undercover overt discrimination. Individuals with invisible disabilities disclosed only if necessary during the recruitment interview preferring not to disclose until employed and then only if accommodation became necessary.

Keywords: Disability, Disclosure, Selection

In employment interviews people with disabilities are often uncertain whether or not to disclose information about their disabilities and how much information is appropriate. Fear of offending the potential employer is ever present, along with the fear of being disbelieved or dismissed as incompetent (Reiff, Gerber, & Ginsberg, 1993). However, Title I (Employment) of the Americans with Disabilities Act specifies that persons with disabilities must disclose before a responsibility to accommodate exists at any point during recruitment, selection, or after employment. The issue becomes when to disclose disability status: during the recruitment and selection process, upon employment, or after a difficulty arises at work.

Research examines disclosure at the time of application, when scheduling the interview, during the interview and after an offer of employment has been made. Interviews of individuals with visible disabilities conducted prior to the passage of the ADA suggested that it was best to disclose disability status prior to the job interview (Huvelle, Budoff, & Arnholz, 1984). The reasons for this include: accepting oneself as a capable person with a disability, knowing the limitations of others "who will be overwhelmed by the disability and unable to give proper attention to the applicant's credentials" (p. 242), surprising an unprepared interviewer causes stress and discomfort creating lasting barriers, and considering it unfair not to give an interviewer time to consider the disability in terms of the work required (Huvelle, Budoff, & Arnholz, 1984). Participants cautioned that disclosing prior to scheduling an interview is not without risk. A practitioner's guide by Hughes and Graham (1994) suggested the decision to disclose should be based on if the disability is visible or invisible, accommodations will be needed, and future discovery of the disability will make the employer suspicious. They caution that an applicant should "first emphasize their job-related strengths, qualifications for the job, and ability to fulfill the essential functions of the job" (Hughes & Graham, 1994, p. 3).

Parry, Rutherford, and Merrier (1995) surveyed human resource managers who felt the type of disability determined when disability disclosure should occur. It was "recommended that employees with physical, visual, hearing, chronic, learning, or other disabilities disclose their conditions at or after the employment interview" (p. 294) while those in the health care industry thought that those with chronic disabilities should disclose prior to the interview. Overall they found that most managers preferred the disability disclosure to occur at or after the interview. Macan and Hayes (1995) found that recruiters gave interviewees higher ratings for interview presentation when the applicant with a disability willingly discussed the disability and encouraged the recruiter to ask questions. Individuals with disabilities that disclosed over the phone were evaluated more positively than able-bodied applicants, however when it came to the hiring decision, the able-bodied applicants were evaluated more positively (Tagalakis, Amsel, & Fichten, 1988). Individuals with disabilities who did not disclose prior to the interview were perceived as less honest and were less likely to be hired then those that disclosed. Parry, Rutherford, and Merrier (1996) found that business schools provide little information on disability disclosure either for their students with disabilities embarking on a job search or for students without disabilities who will have hiring power.

Hayes and Macan (1997) examined the effect of disability on hiring decisions finding that the applicant's self-presentation had a considerable effect on recruiter ratings for college students with disabilities and without disabilities. The student groups were interviewed under different situations. Government agencies specifically interested in hiring students with disabilities for summer jobs interviewed that group. The students without disabilities were competing for regular employment opportunities. Another study used video tapes of actors playing the roles of permanently disabled (wheelchair), temporarily disabled (crutches), and not identified as disabled persons (Christman & Slaten, 1991). The person with the temporary disability was seen as most hirable.

Copyright © 1999 Tonette S. Rocco

next the person in the wheelchair, followed closely by the person without a disability. This might be due to: societal norms for being kind to persons with disabilities, socially acceptable responses, a belief that people with disabilities possess more favorable personality characteristics, and the fear of litigation or social disapproval for expressing negative attitudes (Christman & Slaten, 1991). Klassen, Jasper, and Harris (1993) concluded that "stigmatized traits do play a part in some types of employee decision making" (p. 196) and managers may be tempted to avoid hiring people "who possess a physical stigma" (p. 197) such as obesity, or physical or mental disabilities. The rationale is that hiring stigmatized people makes the other workers uncomfortable.

Method

The purpose of this study was to explore how adults learn to communicate what they need for accommodation to an employer or instructor. These questions were explored: (a) How does the individual self identify? (b) What types of information are needed to facilitate accommodation by instructors and employers? (c) Does the instructor or recruiter/potential employer have a stake in facilitating the self disclosure process? and (d) How does the instructor or recruiter/potential employer facilitate the self disclosure process? Grounded theory (Glaser & Strauss, 1967) was chosen because there is little research on disability disclosure and as Merriam and Simpson write, "A practitioner's knowledge is usually experiential and non theoretical. Grounded theory--if it has truly been generated from the situation and is 'grounded' in the data--will give the practitioner a conceptual tool with which to guide practice" (1989, p. 100).

Two categories of disability, visible and invisible, provide the basis for experiences that cut across specific disability type. Dividing disability into visible and invisible is more meaningful to the everyday experience of HRD practitioners and adult educators who do not normally possess a background in the medical model of disability. Two purposeful samples were compared: 7 students with invisible disabilities, and 8 students with visible disabilities. Interviews lasted forty-five to ninety minutes. The selection criteria were adult status, work experience, and recent enrollment in higher education. Transcripts from each sample were checked against the audiotapes, read, and read for coding. Several months went by between work on each sample to allow categories to emerge from each sample independently. Comparisons between samples were made after all samples were completely coded, and the categories were written up into descriptive text (Wolcott, 1994).

Findings

Participants with invisible and visible disabilities approach disclosure and interviewing differently. Participants with invisible disabilities believed disclosing would eliminate them from consideration for employment. Participants with visible disabilities disclosed to alleviate it as an objection.

Participants with Invisible Disabilities

Six of the seven participants lost jobs due to their disabilities. Jed lost his business because his disability prevented him from continuing as a potter. Mel was quietly terminated when the company's insurer found out that he had a back injury. Cat, Reba, and Nan learned about their disabilities because of difficulties with work. Participants in this sample had not begun a job search since returning to school. The only participant close to graduating was self-employed. Consequently, this sample had little experience with interviewing after diagnosis.

Cat gradually lost most of her vision, kept complaining, and tried a variety of things to make her data processing job accessible. After narrowly missing a child on a bike with her car, she went to a doctor, and quit her job. Reba and Nan became depressed, seeking counseling when they could no longer function in jobs they should have been capable of performing. Both were diagnosed with learning disabilities that affected the interpersonal skills of one and the writing skills of the other. Kim and Reba suggested accommodations to their employers that were denied. Kim was eventually terminated and Reba found a new job. Nan was fired, she believed unjustly, from a job she needed. She didn't understand why she was having difficulties, which caused her to become deeply depressed losing a year of school. A counselor diagnosed her with attention deficient disorder. Kim interviewed knowing she had a disability and did not disclose during the interview for fear of not being hired. Her description:

> The interviews were traditional interviews. As I said I chose not to disclose until I had to. I'm not altogether comfortable with that now that my asthma has developed into a more severe, chronic

> state. I think that to be safe I should disclose, but I'm afraid of not getting a position due to ignorance and fear on the part of my potential employer. (Kim 469-472)

Participants with invisible disabilities did not disclose on their resumes, nor did they choose to during an interview believing they would not be offered the job and "I don't think it would be necessary for them to know" (Nan 383). Cat would have to disclose because she needs an accommodation to read. Kim and other participants would disclose only after it became necessary. They felt they risked more by disclosing up front than after a situation arose even with the fact that there is no expectation of accommodation without disclosure.

There is a potential catch-22 situation when an individual with a disability needing accommodations to complete a college degree chooses not to disclose to an employer. It is highly likely that the job will use the skills and knowledge gained from the degree. It is reasonable that the individual will need similar assistive devices and accommodations on the job as he or she did in college. One result of waiting to disclose until it is necessary, is that a supervisor will question the individual's capability to do the job viewing this new information with suspicion.

Participants with Visible Disabilities

Five of the eight members of this sample had work experience after becoming disabled. Two participants had no work experience. Six had experience interviewing as individuals with disabilities and college degrees. Participants with visible disabilities disclosed on the resume and during the interview. Four had participated in disability related activities such as advocacy groups, sport competitions, and public speaking which they listed on their resumes. Disclosing during an in-person interview situation seemed redundant. The interviewer could see the person had a disability. This formal disclosure had three purposes: relieving the interviewer's tension and discomfort with the subject of disability, setting up ground rules on permissible questions, and uncovering evidence of discrimination early. Jed summed up the reasons:

> Many of them [interviewers] said afterwards I wasn't sure what to ask...I wanted to but I was afraid to ask. ...The way I see it is I don't want to have to go there and surprise them. I don't want the uncomfortable situation. The way I see it, if they don't want to hire me because I have a disability...then I don't want to work there. (Jed 366-372)

Breaking the Ice

In in-person interview situations the disability is obvious, however, necessary accommodations are not. Bess described her tactic, "it's obvious that I have a disability...[so I] would tell them that I've been in a chair since birth and I've worked a lot with children in a wheelchair. That hasn't been a problem" (Bess 282-284). Interviewers asked her, "how I would explain my disability to my students and what I would do and if I thought I could handle things. Do you think your students are going to be able to accept your disability?" (Bess 268-270). It was "only one school system" (Bess 278) that asked those questions. The other school systems "didn't really ask me all that much about my disability" (Bess 280). In fact the one that did hire her,

> Didn't really ask me all that much about my disability. I think I did volunteer that I've worked a lot with children and I've been able to handle them and recounted some experiences but they didn't ask a lot about my disability. (Bess 309-311)

Jed, an engineering student, made the interviewer comfortable, saying,

> Do you have any questions about how I work? Feel free to ask me because I don't know what to necessarily tell them because they don't know....I try to break the ice and say it's okay to ask these type things. That's how I do it now. But usually try to bring it up some time in the direction of the interview. (Jed 282-288)

He had four site visits, each company paid for his and his attendant's transportation and hotel accommodations, and received two job offers. Another engineering student, Pat, described his experiences, "One company has approached me with a second interview with them and the other three have called to let me know that they're still looking for an opening" (Pat 490-491). A difference in their recruitment experiences was Jed graduated in ten weeks, while Pat had three more quarters in school. Both were asked by their respective programs to enter graduate school.

Discrimination

Drake, blind since birth, had two interviews by phone. One was for a job in a distant state. He was one of the top candidates for the position and they were negotiating the cost of his transportation and lodging to get to an in-person interview. He thought it best that he disclose over the phone. He described the incident,

> I disclosed before I would have got the interview and I really think that had something to do with me not getting the interview. After I told them I didn't get the interview. And he says 'really the way our community is we don't think we can facilitate your accommodations because we don't have a great public transit here. It's going to be real hard for you to get music and stuff' and in my mind I thought it was that they figured it would be easier to get somebody, a sighted music teacher in there and I said then forget them. I don't want to work for somebody that's close-minded anyway. Because I always think that I'm going to be honest with people because I want people to accept me based on my abilities and what I can do. (Drake 228-241)

This experience was similar to the interviews he had in-person locally, not getting very far with those either. After completing his teaching certification, Drake tried to gain experience though substitute teaching. This seemed a sensible course of action for any person wanting full time employment as a teacher. Drake "went down and applied for a full time job which none were open" (Drake 268) so he asked to be considered for substitute teaching positions. He had another phone interview, this time without disclosing and was hired. He described the call,

> It was a standardized interview where they asked me questions about how I would deal with certain issues. Most of it had to deal with classroom management things and I didn't do any disclosure with them. The lady I interviewed with had no idea I couldn't see. Actually, I had the interview from my job ...at the Columbus Zoo....There were screaming animals in the background and there was no disclosure at all and she hired me right there on the spot. (Drake 276-282)

Everything went well for over a year until one day after taking an assignment and arriving for work, he was told they didn't need him anymore. Ironically, the previous year at the same school he substituted for the music teacher on maternity leave. Their excuse was that two classes had now been converted into one class making too many students for him to handle. He depicted the incident this way,

> I was turned down for an assignment. After I accepted it they canceled me because one of their classes, their choir class had 100 students in it. They thought that the classes were too big for me to handle. I went down there and raised a little cane about it. I said this is discrimination. I'm a qualified music teacher. I went down to the school to find out who they replaced me with. They wouldn't tell me. They wouldn't put it into writing that they said it was because I couldn't handle big classes was the reason they gave me. I went downtown to talk to sub services and the guy down there tried to turn it around and make it look like I had problems handling classrooms. I said look, we're going to have to do something about this. I'm going to have to get a lawyer and we're going to have to start talking about discrimination and they said we need to come up with some things to better facilitate your needs and I said my needs - when I go out and teach a class I said all I need is for students to realize I'm a qualified teacher and I can teach. (Drake 287-299)

The administration claimed a teacher with a visual impairment jeopardized the safety of the students in band or choir because he could not see them misbehave, and because the classes were much larger than the previous year. Every substitute teacher experiences difficulties with students, assignments, or lesson plans. Since he had worked in this school the previous year without being made aware of any negative performance evaluations, he had every reason to believe his classroom management techniques and teaching ability were acceptable. I have to admit I have a hard time envisioning him doing his job because I have a hard time understanding how one teaches music and how someone who is blind can teach music. There are many famous musicians without sight. The dilemma for me was, how can he read the music to help his students with it? However, the administration did not ask him how he managed to assist the students "read" and play the music. Drake described his technique,

> [Made] recordings of the tunes that they were playing. Brought them home, worked on them for a couple of days and I wrote my own scores. I grabbed a student out of the class that was a real proficient music reader and I picked out all the hard rhythms that I heard in the song that I thought the students couldn't get or needed help with...She would help me pinpoint exactly where it was and so I could communicate that to the band. So they could see it. (Drake 256-262)

He told me that since this incident he had been offered many special education assignments. He had, however, no training or certification in special education.

Job Duties

Jobs are described in a variety of ways to prospective applicants in print advertisements and during the interview process. Sometimes language is used to embellish a job and its importance. Jerry described an advertisement he answered,

> [The advertisement] was very misleading. I thought the ad pertained to being--it really led you to believe that you would be administrating services. It said something like administrating social services in a social service environment which is true but I'd be overseeing donations. Actually they ended up offering me the job but I turned it down. (Jerry 382-386)

Even though he uses a wheelchair, his disability did not make it impossible for him to fulfill "some responsibilities in moving donations" (Jerry 380). He did not accept the position because with a master's degree in social work he wanted something more challenging. He applied for

> Jobs where it was family preservation which is doing in-home visits. Neither one of the ads mentioned that there were in-home visits involved. I would be willing to get out of my chair [to crawl into an inaccessible home] because I do it all the time so it's not that big a deal to me. (Jerry 389-393)

His crawling into a home would be more of an embarrassment to the employer and client than to him.

Pat did not know how to make accommodating him less daunting to potential employers, an essential job function for electrical engineering is to read schematics. He explained,

> That's sort of a stumbling point during my interviews since a lot of times when you get into large schematics...they're enormous and that's hard to spend as much time as I do with a reader on a[n] item like that. (Pat 525-530)

If he offered the recruiter suggestions on how to accommodate, reading schematics would be diffused as an issue. Pat believed the solution was a "computer programming problem. But I feel that an electrical engineer could probably design some hardware and working with a programmer could get something to work" (Pat 536-538).

Previous Work Experience

Previous work experience can be instrumental to securing an entry level position for new graduates. Some participants had work experience prior to becoming disabled but that experience was not directly relevant to the new career choice. Others found it difficult to gain experience because they were born with the disability or acquired it shortly after high school graduation. Sandy described her "work experience as sporadic. The closest thing that I had to what you would consider regular gainful employment was a year as a Vista volunteer" (Sandy 419-420). Neither Pat or Sandy had experience directly related to what they are trying to do now, engineering and communications.

Some students with disabilities were not able to get paid work experience through internships and field placements because federal and state subsidies would be jeopardized due to regulations about funding and work. These benefits are necessary to continue Medicaid eligibility or tuition payments. The engineering program overcame this for Jed, "because she [assistant dean] wanted to see me be placed [and] I wanted to get some experience" (Jed 273) they created a job for him. After "I talked to one of my professors and they said don't take an internship where you don't get paid because if you do they [an employer] won't treat you the same" (Jed 274-276) as a new engineering student with paid experience. Summer time work was arranged designing a computer program,

Jed was paid through a scholarship for books. In this instance, a concerned advisor devised a way for Jed to gain paid experience without jeopardizing benefits.

Just A Pair Of Eyes

Accommodations are as varied as are individuals. They require an imagination expansive enough to take in the disability and the job creating a potential solution. Participants used half time work arrangements, brought their own computer to work, or needed "a pair of eyes." Some arranged all of their own accommodations because they felt totally responsible, and did not know of available assistance, or were so grateful for the opportunity to work they did not expect the employer to do anything. Sandy recalled,

> I think I said something to the effect of you don't need to treat me any differently than you would treat any of the other employees. The answer from her was like, 'Well surely we're not going to treat you any better than [the other employees]...The answer kind of shocked me. (Sandy 449-453)

This conversation ended with Sandy working half a day at home and the other half of the day in the office so that her new personal computer could stay at her home. She went on with the story,

> That did not work well because they felt that I might be taking advantage and goofing off at home so we brought the computer to work. The nature of the job was such that I had to do a lot of footwork and so the friend that I have now that does reading had just retired at that time. He did my driving for me. And then he would also come to the place. I don't know how I'm going to overcome this in the future...But he would come and he would help me with visual work there. That was never really talked about by me or by them...I must have asked cause I'm sure I wouldn't have just had him come in there. But I had the impression that they didn't really like it too much. (Sandy 461-470)

Sandy was working on a doctorate. I asked her about the types of accommodations she would need as a teaching assistant. Her answer was, "Just a pair of eyes" (Sandy 533) to:

> ...Take attendance. They would keep the grade book. When I would have an exam they would be there and keep their eye on the class to make sure no one was cheating. ...They would read me the papers and I would tell them how to grade them. (Sandy 543-551)

She will be teaching a speech class next year. She is "thinking about the gestures" (Sandy 571) and how to grade them since she cannot see them. Other accommodations required physical access as Mel put it, "It's obvious that if they need to come into a room in a wheelchair it's a little bit different than walking into it. You're going to need a different type of surrounding" (Mel 327-329). Or as Jerry said "the only thing I've had them do is put a ramp in front of the bathroom and raise my desk" (Jerry 451-452). Others "need a voice activated computer" (Mel 342) and "a track ball mouse with a table high enough for me to get underneath it" (Jed 293), relatively simple things to do.

Even though many accommodations are commonplace, like ramps, some supervisors seem to want to make things difficult. Bess taught a third grade special education class. The principal fought building a ramp for Bess to enter the school because she did not want to spend the money. After a year in the accessible room, the principal wanted Bess to change rooms from one end of the building to the other. It seemed as if the principal "didn't really think it through before she said it" (Bess 351). Bess continued:

> [The principal] moved me all the way to the other end of the school. She didn't want to build [a new] ramp. In case of fire she wanted me to have my kids go out the door that had the stairs and then go around the school to the door that I could get out and then go around the school and meet my kids. But the other teachers were like, no. (Bess 340-344)

Not only did this not seem reasonable from an accommodation standpoint, it created a potentially dangerous situation for the children and Bess.

Final Thoughts

Experience with employment and the employment process was limited for both samples. Faculty, career counselors, and students need to work together with business and industry to find meaningful internships for students with disabilities. This partnership can investigate ways to lessen overt and subtle discrimination against individuals with disabilities. As Cox (1993) writes,

> It is certainly prudent to include, among the many goals of organizations, social responsibility objectives such as promoting fairness and improving economic opportunities for underachieving members of society. It also seems fair to say that achievement of social responsibility goals enhances economic performance goals in the long term. (p. 12)

Students with invisible disabilities would not disclose during the interview for fear of not being hired. They believed it better to disclose after being hired only if an accommodation was necessary. Since it is invisible, people question the disability's existence or dismiss its impact. Participants with invisible disabilities were afraid that if they disclosed they would be treated as if they were less capable and intelligent. Research on many invisible disabilities is expanding. Young fields of study struggle with research agendas and acceptance by the general public and other related fields. Popular explanations of an invisible disability's affect on skills make the person seem less competent to a prospective employer. Both students with invisible and visible disabilities adopted strategies to avoid or lessen the impact of employer discrimination during the selection interview. Students with visible disabilities disclosed during a job interview for comfort, to establish ground rules, and to uncover discrimination.

Since, the social barriers to reentry to the workplace are great for individuals with disabilities, cultural diversity training should include information relevant to decreasing "negative stereotypes and prejudices" of nondisabled co-workers, and workers with disabilities themselves could also benefit from training that focuses on developing and sharpening their interpersonal skills" (Boyle, 1997, p. 267). It is important to develop an organizational climate that fosters trust between employees and management. Employees who need accommodations but are afraid to disclose for fear of losing the job cost the organization in lost productivity. Accommodations are simply tools that assist individuals work to their potential. Productivity is decreased when an employee is not working to potential (Cascio, 1994). The fear of discrimination on being discovered as a person with a disability can distract an employee from full participation in the workforce (Cox, 1993). Training and development programs that address workforce diversity should be expanded to include individuals with disabilities (Boyle, 1997). Training interviewers in non-discriminatory behavior during the selection process can reduce the costs of discrimination such as reputation, lost talent, legal and administrative costs (Cox, 1993).

Further research needs to be conducted on disability and work from the perspectives of individuals with disabilities and human resource professionals. Some questions for investigation are: how does disability disclosure affect the hiring decision during recruitment and selection, upon employment, or after a difficulty arises at work? What are the steps involved in successful disability disclosure?

The Effect Of Study Skills Training Intervention On United States Air Force Aeromedical Apprentices.

John C. Griffith, Ph.D.
Major, U.S. Air Force

Study skills intervention was shown to significantly increase end of course scores, and decrease remedial instruction for 90 randomly selected students attending a 3 month Air Force allied health technician course. Additionally, students who received the study skills intervention graduated at a higher rate than those who did not. Study skills training, in a corporate setting can enhance student learning and significantly reduce training costs.

Keywords: Study Skills, Cost Savings, Student Performance

Our public education system and national network of colleges and universities are designed to enhance the capabilities of our most valuable national resources, our people. However, many of our educational institutions assume that people know how to learn and know how to study. The teaching of study skills enhance student ability to succeed both academically and in the workforce. An illustration of the value of teaching study skills can be found in the U.S. military. Recruits are brought on active duty, receive formal training and then are assigned a duty position in their career field. Students who fail in technical training are eliminated from active duty before they ever became a "productive member" of the Air Force at a cost of literally millions of dollars per year.

In 1998, a study examined the effects of a study skills training intervention course on U.S. Air Force Aeromedical Apprentices with five main purposes. The first was to examine the relationship between study skills training and the number of times students required academic interventions outside of normal class time. The second purpose was to examine the relationship between study skills training and end of course averages. The third was to determine the relationship between study skills training and the amount of additional instruction, measured in time, students required. The fourth purpose examined the relationship between study skills training and graduation rates. The final purpose was to recommend areas for further research.

Background and History

From 1995 through 1997, Dr Joy Vroonland (Ph.D. University of North Texas) conducted classes that were designed to help military technical school students with their study skills. Vroonland and one assistant gave this training to approximately 3,400 students annually. All of these students were assigned to the 882nd Medical Training Group in 16 allied health professional courses. She believed that the teaching of her study skills course enhanced student performance facilitating student success. However, her opinions were not substantiated by any real statistical analysis. She could not show that the effects of study skills instruction made an impact because the course was taught to all students. No empirical evidence could be shown on the possible positive effects of the study skills training. Moreover, the possible implementation of this study skills course throughout the Air Force depended on the results of an objective and well-designed study.

Statement of the Problem

There was a perceived problem at the School of Aerospace Medicine with regard to student disenrollments, washbacks and failure rates. The school expends a great amount of resources, time and effort to ensure student success. The average cost to train one student in the three month Aeromedical Apprentice course is $12,500.00 (Schommer, 1998). Students who fail the course of study and are eliminated from the program cost thousands of taxpayer dollars with no realized gain by the government or the student.

Purpose of the Study

The purpose of this study was to determine the difference in academic interventions, grades attained, time spent in one-on-one instruction and graduation rates, between students who received study skills training prior to the start and during technical training and students who do not receive study skills training prior to the start and during technical training.

Hypotheses

Study skills course intervention was hypothesized to reduce the number of academic interventions beyond normal classroom instruction, improve higher end-of-course test scores, reduce the time required for one-on-one instruction for student tutoring beyond normal class room instruction and reduce the attrition (failure) rate.

Limitations

The study did not consider racial or ethnic differences in students as a separate variable since the Air Force does not consider race or ethnicity as a factor when recruiting or delivering instruction to Air Force members. The Air Force only considers race to ensure discrimination does not exist.

Delimitations

1. The sample of students was limited to DOD students attending the School of Aerospace Medicine, Aeromedical Apprentice Course, Brooks Air Force Base Texas, from December 1997 to May 1998.
2. One foreign student was excluded from this study due to differences in culture and educational experience as compared to American students.

Literature Review

An extensive review of literature was conducted and included civilian and military sources to fully investigate research on study skills intervention. Particularly noteworthy was McMurry's work "How to Study and Teaching How To Study", a 1909 effort which formed the foundation of many later works in the field. Walter and Siebert (1993) and Ellis (1997) provided excellent explanations of effective study skills methods. These works formed the foundation of the study skills model used in this experiment. Prather (1983) and Sterling (1996) conducted previous research in military training environments.

The National Commission on Excellence in Education stated that many students complete high school without disciplined and systematic study habits. This idea was highlighted in a 1984 study by Christian and Murphy demonstrating the idea that study skills are not taught in high school. Their survey included 479 students from three widely different high schools. In the survey, 74% indicated a desire to attend college, however 70% had not been trained in time management techniques. Additionally, 52 % of the students indicated that they did not typically listen before they began to take notes, and 52% also indicated that they had no system for note taking during class. A surprising 44 % indicated that they received no training on how to read a text book and 82% of the students reported that they studied less than three times per week. Christian and Murphy concluded that the majority of the students in this survey were not adequately trained in study skills. None of the three schools had an organized curriculum concerning the teaching of study skills even though students seemed to want training in how to study. It cannot be assumed that students entering our universities or service's medical technical schools have the appropriate level of study skills needed to succeed. The issue of students "not knowing how to study" is not new. McMurry (1909) made a passionate argument in his book "How to Study and Teaching How to Study" that most people do not know how to study, causing many to fail. The focus of this research was based on the premise that students who are very much alike can have differences in performance which are directly related to their command of study skills. The grade a student gets at the end of a module or a term is not only based on their intelligence but also their ability to use a given set of study skills for differing subjects or courses (McMurry, 1909; Marshak, 1984). Study skills can be better understood by viewing a "Study Skills Model" shown in Figure 1;

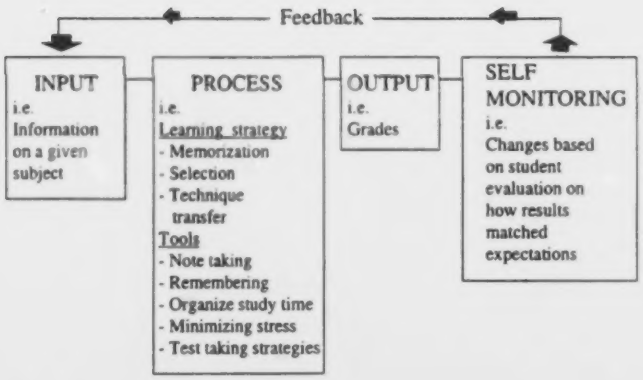

Figure 1. Study skills model.

The model shows four basic steps with a feedback loop used to evaluate the process of study skills and improve it if necessary. The first step is the input process of study skills and focuses on the receiving of information being learned. The second major step in study skills is the process of how the student assimilates data for later use. In this step, the student first determines whether the information has been learned in the past, or is new information. Then the student determines if the information should be memorized, if pertinent information needs to be gleaned from a large amount of information (Selection), or if the student should focus on a specific technique, (such as algebraic formulas) to be used to solve certain types of problems (Technique Transfer). After the student decides the learning strategy, he or she needs to apply the basic study skill techniques which involve effective note taking, remembering, organizing study time, minimizing stress and test taking strategies. The third step in this model is the output the student receives (usually in the form of grades). It is at this point that the student employs "self monitoring" (step four of the model) in answering the question, "did the results match expectations." The student then makes any necessary changes based on the results (grade) for future study.

Differences from Previous Studies

This study on the effects of study skills training intervention on United States Air Force Aeromedical Medicine Apprentices represents a departure from previous studies involving the teaching of study skills to students because it involved military students in a military technical school setting. Previous studies by Smith and Dowdy (1989), Zimmerman and Pons (1986), Christen and Murphy (1985), and Valeri-Gold et al. (1997) have focused on high school or college student settings. Prather (1983) conducted a study at the U.S. Air Force Academy involving 24 students with low grade averages. These studies all assert, in one form or another, that study skills need to be taught to students to enhance their probability of success. Sterling (1996 unpublished dissertation) focused on test anxiety asserting that test anxiety was a factor that could be modified to enhance military student success. Sterling's study was conducted in a military technical school. The major differences between this study and previous studies are that it involved a military technical school setting, focused specifically on the effects of teaching study skills using random sampling (not targeted groups), and followed student progress for at least three months.

Treatment

The treatment in this experiment was originally developed by a board certified psychologist at Sheppard Air Force Base. The researcher modified the course based on the review of literature for this study, four years of experience as an instructor and two years experience as a course supervisor. The treatment (Study Skills Course) was based on the study skills model discussed earlier and emphasized five major areas:

1. Note Taking
2. Remembering

3. Organizing Study Time
4. Minimizing Stress
5. Test Taking Strategies

The class was taught in a 90-minute session prior to the start of the Aeromedical Apprentice course. Additionally, a one-hour follow up session was given to students one month after they began technical training in the Aeromedical Apprentice course. It was intended to put the students in the correct frame of mind to approach their studies in an effective fashion. The class was interactive as the students were encouraged to participate and express their opinions.

The content of the study skills course offered as the treatment in this study is well founded in the literature and previously identified in the discussion of the Study Skills Model.

Research Design

This experiment used the post test only control group design (Campbell & Stanley, 1963; Yount, 1990). This design used a treatment group and a control group. The treatment group received study skills training and was measured on four dependent variables. The control group was measured on the same four dependent variables, but received no treatment (study skills training).

The experimental control used in this study was random assignment (Hinkle, Wiersma & Jurs, 1994; Kirk, 1995; and Kerlinger,1986) and the use of the disguised experiment technique (Kirk, 1995). Subjects were randomly assigned to two groups, the treatment and control group allowing the researcher to consider the treatment and control group statistically equal. In effect then, the design of this experiment is expressed as follows (Campbell & Stanley, 1963; Yount, 1990)

Treatment Group	R	X	O_1
Control Group	R		O_2

The statistical analysis used in this experiment was regression analysis. The aptitude of all students in this experiment had already been measured by the Armed Services Vocational Aptitude Battery Test General Score which was used as a covariate in the experiment. Use of the covariate reduced the amount of unknown error making this design even more powerful (Yount, 1990). The directional hypotheses were tested using regression analysis at the $p < 0.05$ level.

Statistic

All of the hypotheses were tested using regression analysis comparing results obtained from comparing the full model to the restricted model for each hypothesis. The Full Model used was; Y (The dependent variable) = X_1 (Student ASVAB Score) + X_2 (As indicated by a 0 for the control group or 1 as the treatment group to show group membership) + error. The Restricted Model used was; Y (The dependent variable) = X_1 (Student ASVAB Score) + error. The difference between the Full and Restricted Models was represented in an F ratio which indicated significance or non significance. This procedure was used for each hypothesis tested in this study, (Hinkle, 1994).

Ethical Standards

Informed consent was obtained from the University of North Texas human subjects review board. Written approval was obtained from the Commander, School of Aerospace Medicine, Brooks Air Force Base Texas where the study was conducted. This report was made available to the School of Aerospace Medicine and the United States Air Force to further knowledge regarding the effects of study skills training. The study was designed to be as unobtrusive as possible with its only possible impact being improvement of student performance and improved methods for student retention.

Independent Variables

The main independent variable was a study skills intervention consisting of a 90-minute study skills course and a one hour follow-up session four weeks after the start of technical training.

The second independent variable used in this study was student ASVAB General test scores. These scores were designed to show student aptitude. The main purpose for using ASVAB General test scores in this study was to show that the treatment and control groups were similar and to reduce the amount of unknown error making the design even more powerful (Yount, 1990).

Dependent Variables

Maring, Shea and Warner (1987) argued that evaluating a study skills program on the basis of a single variable, such as grade point average, is inappropriate. Therefore, four dependent variables were chosen for this experiment. These variables were: number of academic interventions for individualized instruction, end-of-course test scores, time spent in one-on-one instruction for student individual assistance, and graduation rates. The dependent variables involving extra time devoted to students who needed help beyond normal course time, (number of academic interventions for individualized instruction and time spent in one-on-one instruction for student individual assistance) were reported to the researcher through weekly updates during the experiment. End-of-course scores and graduation rates were reported upon course completion.

Results

This study examined a random sample of 90 U.S. Air Force Aeromedical Apprentice students, (representing a population of approximately 250 students). The sample included Air Force and Air Reserve Component students who were new to the Air Force as well as senior non-commissioned officers with over 15 years of prior military experience. Subjects were randomly assigned into the control and treatment groups of 45 students each and observed for a three-month period.

A detailed analysis using independent samples t-tests was conducted to ensure the control and treatment groups were not different in any statistically significant way at the $p < 0.05$ level. Additionally, the fact that the groups were randomly selected suggests that the control and treatment groups were similar at the beginning of the experiment.

The study skills course was given to the treatment group on the first day of training, (90 minute orientation) followed by a 60 minute session one month later. The study skills course was not given to the control group.

Four null hypotheses were formulated to determine the effectiveness of the study skills course. Each hypothesis was tested by comparing full versus restricted regression models. The differences between the r^2 values of the full and restricted models were then computed to determine statistical significance at the $p < 0.05$ level. These results are shown on the table below;

Table 1

Statistical Results of Full Vs. Restricted Models, Critical Values and Significance Levels

	F Value (Full Vs. Restricted Models)	Critical Value	Sig*.
Ho_1	5.18	3.951	0.025*
Ho_2	5.454	3.951	0.022*
Ho_3	5.048	3.951	0.027*
Ho_4	1.367	3.951	0.246

Hypotheses 1, 2 and 3 were rejected, signifying a statistically significant correlation at the $p<0.05$ level between study skills training and dependent variables of; amount of times additional instruction was required, (negative correlation), end of course grade average, (positive correlation) and additional time required for one-on-one

instruction for student tutoring beyond normal class room instruction, (negative correlation). Hypothesis 4 was retained at the $p<0.05$ level.

Conclusions

Based on the findings of the study, the following conclusions were reached:

1. A statistically significant negative correlation existed between the independent variable of study skills training and the dependent variable of the number of times students required additional assistance outside of normal classroom instruction. Students who were trained in study skills required additional assistance on fewer occasions than students who were not trained in study skills.
2. A statistically significant positive correlation existed between the independent variable of study skills training and the dependent variable of end-of-course grade average. Students who were trained in study skills had higher end of course grade averages than students who were not trained in study skills.
3. A statistically significant negative correlation existed between the independent variable of study skills training and the dependent variable of the amount of time spent in one-on-one instruction for student individual assistance outside of normal class time. Students who were trained in study skills required less time spent in one-on-one instruction for student individual assistance outside of normal class time than students who were not trained in study skills.
4. Although the student attrition-rate was 50% lower in the treatment group, (3) than the control group, (6), the difference was not statistically significant at the $p<0.05$ level. In this particular study, students who were trained in study skills were more likely to graduate than students who were not trained in study skills.
5. The ASVAB General score was a statistically significant predictor of all of the dependent variables used in this study.
6. The Study Skills Model presented earlier is an effective tool to use when developing and delivering a study skills course.
7. Findings of this study were consistent with earlier works of Zimmerman and Ponds, (1986); Kirschembaum and Perri (1982); Entwisle (1960) and Prather (1983). These works indicated that study skills training can yield statistically significant positive results. This is especially true with study skills interventions that include multi-component instruction which involves such components as note taking, reading, test taking strategies, organization of study time, etc. and if the study skills instruction is reinforced over time.
8. The implementation of the study skills course used in this experiment appears to be a very effective use of time and resources. The amount of time and resources expended in providing additional instruction to poor performing students and/or the cost incurred when a student fails a course dictates the use of preventative methods such as the study skills course used in this experiment. The cost of training each Aeromedical Apprentice student was over $12,500.
9. Air Force health care technical schools should encourage the teaching and use of effective study skills techniques to their students that reduce remedial instruction and increase end of course scores and graduation rates. Continued efforts in the area of study skills training will lead to a reduction in costs for the Air Force and savings for U.S. taxpayers.

Recommendations for Further Study

1. The results of this study suggest a possible relationship between study skills training and graduation rates which should be further explored.
2. The results of this study suggest applicability of study skills intervention to other fields of technical training. The study skills intervention course in this experiment could provide a basis for further studies implementing study skills interventions in military and civilian medical and non medical training settings.
3. Further studies regarding age and education level should be conducted prior to implementing a study skills intervention course in adult non-technical training environments.
4. Further research should be conducted in primary and secondary school settings to determine the feasibility of providing sustained cost effective study skills training to students early in their academic careers to enhance their learning capabilities.
5. Further studies should be conducted to identify the minimum number of study skills training sessions required for effective adaptation of study skills as evidenced by little or no remedial training and high graduation rates.

UL 305

6. Further research should be conducted to determine the projected cost savings of implementing a study skills intervention course throughout U.S. Air Force medical and non medical technical training schools. This analysis could then be applied to the other three branches of the military if cost savings prove significant.
7. Further research should be conducted to reexamine that ASVAB (Aptitude Test) score threshold used to assign Air Force recruits as Aeromedical Apprentice Technicians.

Air Force Implementation

The U. S. Air Force School of Aerospace Medicine has incorporated the study skills course described in this article into all five enlisted courses taught at the school in September, 1998. Additionally, the author has put forth an official Air Force suggestion regarding the implementation of the study skills course for all Air Force initial technical training courses in an effort to offer this training to over 25,000 students per year.

If more students succeed in technical training courses, the Air Force will save money in recruiting and training costs amounting to millions of dollars per year. The current Air Force technical school failure rate is approximately eight percent. The Air Force can save an estimated 1 to 2 million dollars, (in training costs alone) for each percentage point reduction in the failure rate.

Contribution to Human Resources Development

We currently live in an environment where people will be expected to learn more skills and even change careers at an unprecedented rate. U.S. Air Force technical training mirrors many corporate training programs and in fact, sets an example for training a diverse workforce to perform a complex mission. Study skills training, which costs little in resources and time, can help ensure that technical corporate training programs are successful. We can not assume that the workforce knows how to study, or even learn. Many people have not effectively honed these skills. The cost to corporate America due to ineffectiveness is incomprehensible. We need to ensure the workforce has mastered the skills of learning to allow them to adapt to an ever changing environment so that corporate America can succeed in the brave new world of global competitiveness.

Helping Employees Develop Computer Skills While at Work: An Exploratory Study

Henriette M. Pranger
Quinebaug Valley Community Technical College

This paper reports findings from a study of how employees develop computer skills at work. Interview data from a cross section of employees working at an international insurance company described what promoted learning from the employees' perspectives. The interview themes were translated into strategies for enhancing the learning of computer skills in classroom and daily work settings. This study applied the deliberate practice framework (Ericsson & Lehmann, 1996) to the development of computer skills.

Keywords: Computer Skills Development, Learning Strategies

In an era when businesses are increasing their use of information technologies, Human Resource Development (HRD) personnel are faced with the problem of helping employees develop computer skills. Many employees need computer skills to gain employment (Dugger, 1997), and must keep their skills current to maintain their jobs (Cahoon, 1996).

A common approach to solving this problem is to offer classroom training (Watkins, 1995), which may not be the most effective strategy for helping employees develop computer skills (Gattiker, 1992). In work settings, new training needs evolve quickly, creating a time lag between the need to learn new skills and the scheduling of classes. Furthermore, research in the area of adult learning indicates that classroom training results in marginally useful outcomes especially when the design of daily work environments does not promote learning (Broad & Newstrom, 1992).

Structuring the work environment to promote learning and to increase overall productivity via technology is one of the major challenges faced by Human Resource Development personnel (Rhinesmith, 1994). New theoretical models are needed that (a) identify when formal classroom training is helpful and (b) account for the ways in which employees learn informally in daily work settings. Theoretical models could then be used to help guide the design of workplace learning initiatives. This study addressed the problem: How can HRD personnel best help employees develop computer skills?

Theoretical Rationale

This section describes the theoretical rationale that guided the design and conduct of this study. Research reviews in the area of computer education identified prior experience as the only variable that consistently demonstrated a noteworthy relationship with the development of computer skills (e.g., Mauer, 1994). In many studies, experience was defined in terms of quantity (e.g., number of hours or classes) which did little to inform practice other than to suggest that more time on the computer leads to improved performance.

Ericsson and Lehmann (1996) disagreed with the conclusion that that skill development is a function of an individual's amount of overall experience. They argued that skill development occurs as the result of engagement in a specific type of experience referred to as deliberate practice. According to Ericsson, Krampe, and Tesch-Romer (1993), "deliberate practice is a highly structured activity, the explicit goal of which is to improve performance. Specific tasks are invented to overcome weaknesses, and performance is carefully monitored to provide cues for ways to improve it further" (p. 368).

The deliberate practice framework describes four general conditions that may contribute to skill development: (1) the learner's willingness to engage in (2) structured learning experiences, (3) guided practice, and (4) independent practice activities. The experts' learning process began with initial interest that was sustained for a long period of time, with encouragement and support from parents or teachers. The learners' motivations to become experts led them to engage in structured learning experiences. Coaches or trainers designed structured learning experiences to (a) improve specific aspects of performance through repetition and successive refinement, and to (b) teach all the relevant knowledge and skills in a discipline. The coach also guided the learners initial practice activities and provided immediate feedback. The learners also completed practice activities independently, which required a high level of concentration and focus.

When experts engaged in structured learning experiences and guided practice that was supplemented by

Copyright © 1999 Henriette M. Pranger

independent practice activities, skills developed that set the stage for continued learning and that led to the development of expertise over time (Figure 1). While the general description of this learning process emerged from the analyses of experts' diaries and other autobiographical material, the process may shed some light on how non-experts could improve their skills.

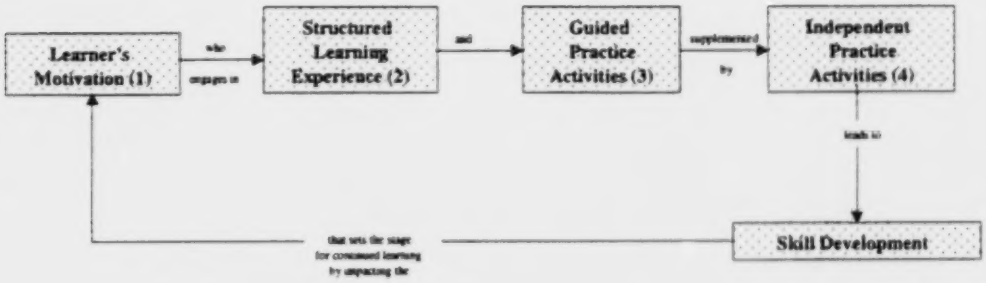

Figure 1. The conditions believed to contribute to the development of expertise: The Deliberate Practice Framework (based on Ericsson & Lehmann, 1996).

Research on the deliberate practice framework was extended to the development of computer skills, but only to the domain of computer programming with highly experienced computing professionals as subjects (see Koubek & Salvendy, 1991; Pirolli & Recker, 1994). This stream of research investigated the cognitive processes associated with expertise (i.e., how experts retrieve, organize, and evaluate information) rather than the usefulness of the deliberate practice framework to promote skill development by discretionary users.

In summary, Ericsson and Lehmann's (1996) work on deliberate practice highlighted the importance of experience to the skill development process and described the general conditions believed to contribute to performance improvement. Although the intent of the research on the development of expertise was to draw conclusions about general human behavior, Ericsson and Hastie (1994) concluded that researchers are "remarkably ignorant" about how people acquire skills in everyday situations (p. 65).

This study extended the focus of prior research by studying adults developing their skills in daily work environments. If computer skills are built day-by-day over time, then the major variables that influence the skill development process may be found in the learners' daily work environment. If experience is an essential component of the process through which experts develop skills, then the deliberate practice framework might be useful for identifying some of the variables, or aspects of an experience, that facilitate the development of computer skills in non-experts. Other variables may also underline the effectiveness of work-related learning experiences.

Methodology

Two questions focused the collection and analysis of data in this study: (1) What aspects of an experience do employees report as promoting or inhibiting the development of computer skills while learning in a *formal, classroom setting*? (2) What aspects of an experience do employees report as promoting or inhibiting the development of computer skills while learning *informally on the job*?

Responses to these questions were collected using an hour-long interview conducted by the researcher. The interview used a semi-structured format that allowed the comparison of answers among employees, but did not restrict the responses to a predetermined set of variables (Bernard, 1994). The data collection began with the employees describing the computer skills required to complete daily job tasks. These skills were limited to (a) skills required to operate a personal computer and (b) skills required to use application software (e.g., Microsoft Office programs). Then the employees sorted cards that listed computer skills into two piles: (1) skills the employee had learned or (2) skills the employee had not yet learned. The employees sorted the cards a second time into (1) skills

for which classroom learning was most influential and (2) skills for which formal learning was most influential. The interview continued with the employee describing how specific skills were learned. The tape-recorded interviews continued until new data was not offered ($n = 20$).

The interviews were conducted at an international insurance company that was selected because insurance was the major industry in the region and the work environment was characterized by ongoing technological change and high productivity demands. Employees were selected to represent the maximum variation (Patton, 1990) of ages, gender, work experience, and technological expertise found within the department of sixty employees. The sample in this study consisted of a diverse group of employees with respect to age (26-59 years, $M_{age} = 44$), educational level (11-18 years, $M_{years} = 14$, associates degree), and experience learning to use computers (25% beginners, 50% intermediate, and 25% advanced users). All of the employees used the computer to do part of their jobs. Half of the employees had no formal computer training outside the company. All employees had attended at least one company sponsored computer training. While the background characteristics of the sample were diverse, their perceptions of learning outcomes and the learning process were relatively uniform.

The data analysis began when the researcher transcribed the interviews directly into Ethnograph Version 4.0 (Seidel, Friese, & Leonard, 1995), a software program designed for text-based data. The computer program facilitated the researcher's efforts to reduce the information into a series of variables that could then be examined for relationships (Weber, 1990). The approach to content analysis used in this study consisted of eight-steps (Chi, 1997). (1) The researcher read the interview transcripts and created a codebook. (2) The researcher coded segments of text that identified variables that represented employee perceptions of what promoted or hindered their learning. (3) The data were summarized into a hierarchy of themes-by-setting. (4) The researcher then sorted the major themes using the conditions of the deliberate practice framework (e.g., structured learning experience, guided practice, etc.). (5) The researcher re-coded the data a second time. (6) The hierarchy of themes was revised as necessary. (7) The top two levels of the hierarchy were used to answer the research questions and to generate frequencies.

To strengthen the accuracy and objectivity of the data, a second qualitative researcher not associated with the study reviewed the data collection and analysis strategies. The researcher had each employee review and comment on his or her own transcripts as well as a preliminary report of the study findings. The researcher also engaged in peer debriefing at regular intervals during the data analysis process. A limitation of the study was that the findings were derived from the employees' perspectives and were not confirmed through the collection of additional data sources.

Results

An analysis of the interview data revealed three key findings. First, employees reported having learned a wide range of computer skills in both the classroom and daily work setting. Of the 41 skills covered in the interviews, employees reported having learned all of the skills on the job (100%) and 39 of the skills in a classroom setting (95%). The skills ranged from basic skills required to operate a personal computer to skills required to complete job tasks using Microsoft Office application software (e.g., Access, Excel, PowerPoint, Word). In other words, all but two skills were reported having been learned by an employee in either setting. Because the employees reported having learned the same computer skills in both classroom and daily work settings, the researcher concluded that the learning of computer skills was not limited to a classroom setting. This conclusion was supported in the interview data. For example, one employee remarked, "I liked learning in either setting" Another employee remarked, "The classroom training was enough to get me started and then my skills were strengthened over time because I did it on the job."

Second, employees reported that the place of learning (e.g., classroom or work setting) was not as important as the instructional process (e.g., having access to a computer coach). The analysis of the interview transcripts identified eight themes that described employee perceptions as promoting learning in both the classroom and daily work setting. In other words, the same things promoted learning in either setting. The summary provided by Table 1 begins with a column titled "Instructional Process" that lists the integrated theme or activity that functioned across settings. The frequency indicates the number of employees who mentioned the theme at least once. The second and third columns summarize the subthemes by setting.

Third, the themes identified in Table 1 provided a more detailed description of the deliberate practice framework. The following paragraphs discuss the themes highlighted in Table 1 and their relationship to deliberate practice.

Table 1

Employee (n = 20) Perceptions of What Promoted the Development of Computer Skills Across Settings

Instructional Process Major Theme (%, Frequency)	Classroom Setting Sub-themes	Daily Work Setting Sub-themes
1. Reflective Dialogue (95%, 19) *Lea became engaged in the learning process whe initiated a conversation with so knowledgeable about computers.*	(+) Talked with instructor (+) Helped by other learners (+) Had all questions answered (+) Completed hands-on act accompanied by discussion	(+) Learner initiated dialogue (+) Dialogue focused on lea questions (+) Used clear language, not jarge
2. Independent Practice (95%, 19) *Learner the new skill frequently and experimented.*	(-) Limited practice in class (-) No opportunity to practice class	(+) "Use it or lose it" (+) Opportunity to experiment (+) Job tasks viewed as p activities
3. Direct Experience (85%, *Learners developed computer skills through hands-on experience as opposed to p listening.*	(+) Each person had a computer (+) Hands-on applications	(+) Learn-by-doing (+) Lots of hands-on repetition
4. Guided Practice (85%, *During interactive sessions, the demonstrated a function, and then observe learner practice the new function until comfortable.*	(-) Limited opportunity to apply skill after class with help (-) No access to someone who answer ongoing questions	(+) Someone watched me (+) I watched then s/he watched me (+) Someone observed & pr feedback
5. Helpful Feedback (80%, *Ideal feedback was immediate and was mor showing someone the steps of a function.*	(+) Determined what went wrong	(+) Immediate (+) Identified why I did not understand (+) Answered my repetitive questions (+) Explained why and how
6. Trusting Relationship (75%, *Learning occurred in the context of a t relationship.*	(-) Mixed group composition (-) Large group size (-) Unhelpful trainers	(-) Not helpful coworkers who impatient and answers incomplete (+) Helpful coworkers were pat willing to answer questions
7. Time to Focus on Learning (75%, 15)	(+) Time to learn (+) Focused on learning (+) Few distractions	(-) No time to learn (-) Distractions (-) Conflicting priorities
8. Incremental Learning (60%, *Learners developed computer skills in the con a genuine problem (e.g., job task) and incremental manner that built on prior knowl*	(+) Made analogy to what is known (+) Related new skill to job tasks (+) Learned step-by-step (+) Built on steps over time	(+) Related to job task (+) Related to what is known (+) Built skills over time

Note. (+) Indicates theme perceived to facilitate learning, (-) indicates theme perceived to inhibit learning.

Structured Learning Experiences

The results from this study confirmed the importance of structured learning activities to the skill development process. The employee descriptions not only confirmed the usefulness of structured learning experiences but also described three helpful aspects of these experiences: (a) reflective dialogue, (b) direct experience, and (c) incremental instruction.

Employees (95%, 19) perceived structured learning experiences as helpful when they included reflective dialogue. Learning dialogues differed from regular conversation because they were (a) initiated by the learner, (b) centered on the learner's questions, (c) continued until all the learner's questions were answered, (d) used clear language as opposed to computer jargon, and (e) were accompanied by direct experience. Employees (85%, 17) described direct experience as the immediate, hands-on use of the computer as opposed to learning by passively listening and watching someone else demonstrate how to use a skill to perform a task.

Employees (60%, 12) preferred to learn new skills incrementally. Incremental instruction referred to the employees' preferences for learning a new skill (a) step-by-step, (b) in relation to skills already learned, and (c) in small increments over time. A representative statement was, "I like to learn one part first. And, if there are a lot of different ways to do something, I want to get the first way down pat. Then go on to the next one. That is how I like to learn. I don't want to be taught a million things at once. If I am already familiar with it, then I could learn more. I like to learn one thing at a time."

The interview data did not describe traditional, didactic, lecture-based approach to instruction in a large classroom setting. Instead, the employees described smaller, less formal learning sessions characterized by hands-on activity and conversation. These findings suggest that the formal learning experiences (e.g., classroom training or one-on-one coaching) are helpful especially when (a) smaller in size, (b) scheduled as multiple sessions that build on each other, and (c) focus on content learned in a conversational and experiential manner.

Guided Practice

According to the deliberate practice framework, two types of practice activities enhance skill development: (a) with a coach and (b) alone. The employees in the current study also identified these two types of practice activities as promoting the development of computer skills. The study extended the deliberate practice framework by (a) addressing the development of computer skills in organizations and by (b) identifying the characteristics of effective computer coaches.

Employees (85%, 17) identified the guidance provided by another person knowledgeable about computers as essential to the development of computer skills in both the classroom and daily work setting. For example, employees identified trainers or other class participants as coaches in the classroom setting and identified coworkers as coaches on the job. A representative statement was, "I sat at the computer and watched and then she moved over and I took over. She sat with me and watched me for a while to make sure I understood." Employees identified coworkers as informal coaches more often than designated trainers or supervisors. Coaching took place (a) during, (b) in lieu of, or (c) as a follow-up to structured learning experiences.

The study also provided information on the characteristics of effective computer coaches. Coaches promoted or inhibited learning through their feedback. Employees described effective feedback (86%, 16) as immediate and as more than explaining how to perform a skill (e.g., "Do this, then this, then this..."). The ideal nature of feedback was that which: (a) identified why the learner didn't understand something, (b) explained "why a skill worked" in addition to "how to do it", and (c) provided answers to all questions, especially repetitive ones.

The definition of useful feedback had implications for informal coaches who answered technology-related questions. According to one manager, time pressures led employees to answer questions quickly (e.g., how to "get it done") and there were performance consequences when employees are only taught the specific buttons to press rather than the concept or software structure. One consequence was that employees were ill equipped to handle novel situations. The manager discussed the limitations of merely showing someone how to do something without explaining why, "...they don't have to see connections or opportunities to resolve a problem...for example, people who have automatic cars tend to only use them in drive or park. But when the condition changes (for example, rain, severe grades, and snow), they never use any of the additional tools available to them. No one has ever explained to them what the gears are for (for example, a lower gear gives you more traction in wet conditions). If you took training one-step further, they would have more command of the automobile in all situations."

Employees (75%, 15) also preferred to learn new skills from someone perceived as patient, helpful, and respectful. The person was either a trainer or coworker. People were not viewed as helpful when they acted irritated, frustrated, rushed or used computer jargon. This finding has implications for trainers as well as employees who wish to be effective computer coaches. In this study, the resident computer expert was selected as the designated "computer coach." Also of interest was the tendency for the management in this organization to request the resident computer coach to complete special projects that left her little time to help coworkers.

Independent Practice

Ericsson wrote that there is an inherent conflict between working and learning. The potential conflict becomes apparent in the employee descriptions of independent practice. Employees (95%, n = 19) also perceived frequent opportunities to practice using a new skill independently as helping to facilitate learning; however, all but one employee mentioned that more time to was needed to practice and experiment with new skills. Lack of time for independent practice resulted in employees using less efficient skills to complete work tasks or staying with "the old way of doing things." A representative statement from an employee who attended a word processing class was, "Just recently I was going to use the word-processor to type a fax coversheet rather than hand-write one. I tried to figure out how to do it and I finally gave up. I ran out of time and I decided to just do it by hand. I didn't have time to ask anyone." Independent practice was supported when (a) employees requested and received help, (b) job tasks were designed to reinforce formal training, and (c) and when employees see the direct application of a new skill to the performance of a work task.

The Learner

The initial description of the deliberate practice framework included the learner's motivation level as influencing the learning process. Although motivation was not the focus of this study, interview segments included reasons that the employees gave for learning to use computers. The five reasons mentioned most often were that the employees: (1) needed to learn to solve a problem, (2) wanted to learn because of an immediate benefit (e.g., save time), (3) were forced to learn to maintain employment, (4) enjoyed learning for learning's sake, and (5) were motivated to learn by a possible reward. The reason mentioned most, learned to solve a problem, suggests that coaches identify problems the learner wishes to solve and then present new material in the context of these problems, using exercises that mirror daily work activities as to practice the skill.

In summary, the employees' descriptions validated the deliberate practice framework as a model for describing how adults learn computer skills while at work. The framework places formal training as part of a larger group of learning activities. The data allowed for a more detailed description of how adults learn computer skills at work than provided by the initial deliberate practice framework.

The deliberate practice framework (Ericsson & Lehmann, 1996) was useful for organizing the eight themes and their subthemes. The framework identified how the themes work together to describe a possible model of how employees develop computer skills while at work.

Implications for HRD

Human Resource Development personnel could help employees develop computer skills by incorporating employee perceptions of what does or does not work into the design of learning initiatives. The deliberate practice framework, as described in this study, translated into specific questions that could guide the design of a learning initiative. The first column in Table 2 lists the questions associated with each condition of the deliberate practice framework. The second column lists a specific recommendation suggested by the employees in this study to promote the development of computer skills in their company.

The questions listed in the first column of Table 2 raise two issues. First, are structured learning activities, both formally in the classroom and informally at the learner's desk, designed with the learner's input and offered frequently enough to provide incremental learning? Second, who will serve as computer coaches (e.g., trainers, coworkers, and supervisors) and how do we ensure that they are skillful and effective in their efforts to promote skill development? The second column lists specific strategies for promoting deliberate practice. These include revising job descriptions, performance appraisals, and reward systems to reflect the teaching and learning of technology.

Conclusion

This study places traditional, classroom-based training in the broader framework of deliberate practice, and suggests that formal training be offered in concert with other deliberate practice activities embedded in the daily work setting (e.g., guided practice, independent practice). The theoretical significance of this study was that it extended the framework of deliberate practice to developing computer skills in work settings. The practical significance was that it offered suggestions that HRD personnel could use to improve the development of computer skills in both classroom and daily work settings. Future research could investigate: (a) the validity of the model, (b) the impact of

the process outlined in the model on increasing productivity and the efficient use of technology, and (c) the utility of the model in explaining the development of computer skills across different populations.

Table 2

Designing Classroom and Daily Work Settings to Promote the Development of Computer Skills

Question ✓	Possible Application
Learners	
❑ Are employees in the planning process?	Include employees and managers on committees that determine organizational goals regarding technology and that design/plan educational efforts.
❑ Are learners rewarded for developing computer skills?	Continue to support learning beyond an employee's initial orientation to a job by making learning and teaching part of the employee's daily job responsibilities.
❑ Are employees rewarded for teaching coworkers new skills?	Revise performance evaluations to reward employees for developing new skills that result in more efficient use of technology and for teaching other employees to use those skills.
❑ Do employees see new learning as connected to goals that are personally relevant?	Provide a regular forum for employees to communicate discoveries or suggestions about business applications of PC software that improve productivity.
❑ Do employees have time to learn?	Give employees time to practice new skills (e.g., include learning time when determining production quotas).
Structured Learning Experiences	
❑ Are regular training sessions scheduled both formally in classroom settings and informally at the learner's desk?	Define performance competencies with regard to computer skills. Develop goals and a plan for achieving them that incorporates the principles embedded in the deliberate practice framework.
❑ Are training sessions learner-directed, conversational in nature, and primarily hands-on?	Have trainers, employees, and managers collaborate around the design of regularly scheduled training activities and the design of follow-up practice activities.
❑ Are trainers/coaches skilled in incremental instruction?	Retrain external and internal instructors along with employees in experience-based, developmental teaching techniques.
Guided Practice	
❑ Are coaches skilled in providing informative feedback?	Formalize informal learning networks by updating regularly a list of "who knows what" and who are effective coaches.
❑ Are systems in place so employees have access to immediate feedback?	Provide guidelines and suggestions for effective coaching behaviors and techniques.
	Reward groups as well as individuals (e.g., provide compensation systems that reward performance that includes quality, innovation, and teamwork).
Independent Practice	
❑ Are job tasks assigned so that they (a) build on new skills being learned in structured training sessions and (b) provide opportunities to practice and experiment with new skills?	Reward risk taking and view mistakes as opportunities to learn instead of taking disciplinary actions and marking down job reviews.

Defining Core Problems for on the Job Training: An Example in the Car Repair Trade

Simone J. van Zolingen
University of Twente, the Netherlands

Jan N.Streumer
University of Twente, the Netherlands

The aim of this paper is to highlight the importance of the inclusion of core problems in training courses and the presentation of an instrument to describe core problems systematically. Based upon 30 interviews, the core problems of three occupations: service manager, diagnostic mechanic and receptionist working in garages are systematically described.

Keywords: Core Problems, Training, Car Repair Trade

Changes in technology, organizational renewal, optimization of the quality of production and orientation to changing consumer demands require higher standards of skills and flexibility in the work force (Penn, Rose, & Rubery, 1994). In order to meet these standards, it is necessary to deliver more training to the work force and define training in terms of investment rather than costs (Mirvis, 1993). Training of employees can be regarded as a major challange for human resources development. Because of all the changes in the labour system, many simple routinised tasks are automated and complex tasks, where only adaptive human intelligence can make the evaluations and the decisions needed, remain (Resnick & Wirt, 1996). Employees nowedays need to be able to function in an uncertain environment, to handle symbols, to communicate with difficult clients, to work in groups, to learn, to take decisions on their own and to communicate with collegues from different fields (Zuboff, 1988; Appelbaum, & Batt, 1994; Thompson, & Warhurst, 1998). Therefore the aim of training should be broadly trained employees that react flexibly and effectively to changes in their work, organization or career (Van Zolingen, 1995; Nijhof, & Streumer, 1998). This implies a revision of the content of training. A new outlook upon training of the future is to learn employees to handle the core problems of their occupation (Onstenk, 1997a, b, c). Core problems are problems and dilemmas that are central to the practice of an occupation (Laur-Ernst, 1984; Onstenk et al 1990). A first step in this process is to develop an instrument to define and describe core problems for occupations. This paper describes this process for service managers, receptionists and mechanics working in a garage.

Core Problems

Core problems are problems and dilemmas that are central to the practice of an occupation. These are problems with which an employee regularly comes into contact, which are characteristic of that occupation and for which the employee is expected to have a solution for tackling them. They involve considerations and choices relating to dilemmas, where the application of knowledge and skills and the use of the appropriate register of actions will determine whether someone is a more or a less professional worker. Core problems involve characteristic, central occupational situations in which 1) complex problems have to be solved and 2) the specificity of the situation, as well as 3) its social context, play an important role.

In recent publications Onstenk (1997a, b, c) relates core problems to the context of the work organisation as a whole. He distinguishes core problems that relate to 1) the production process, 2) the organisation and 3) the socio-communicative context:

Production problems relate to the object of the work activity (the material and the product), to the instruments and technology employed, and the extent to which the organisation of the work allows for regulatory problems. These are problems that may occur at the time of preparing, performing, supporting or checking tasks in the primary process.

Control and regulatory problems relate in particular to working in a company as a hierarchical organisation where there is a division of labour. These are problems that result from the way in which the production process is organised (think of regulatory tasks; division of tasks; fitting into the organisation; dependence on others; coordination and harmonisation).

Copyright © 1999 Simone Van Zolingen and Jan Streumer

Socio-cultural problems stem from working in the occupational and industrial sector. These are problems that occur when working together with colleagues, in a particular occupational or corporate culture and theories and opinions existing within the occupational category or company that relate to that occupation.

Onstenk emphasises that these problems areas overlap and are interrelated.

Onstenk defines the relationship between core problems and occupations as follows: 'one or more sets of specific production problems, forms of organisation, and socio-cultural context and problems are characteristic of a particular occupation. These characteristic sets can be designated the core problems of an occupation (1997a). In principle, core problems can be defined for every occupation. The 'core' of the occupation can be summarised and structured on the basis of core problems; this definition is, however, not exhaustive. According to Onstenk, an analysis of specific sets of tasks that have to be performed is also needed. He defines occupational competence as a set of routines (knowledge and skills) with which tasks can be performed, the ability to solve problems, to anticipate unexpected situations and to decide when which route is most appropriate, or must be optimised and changed .

Onstenk places the emphasis on three aspects of core problems: These relate to complex problems that are of primary importance in the practice of an occupation. They must be tackled in concrete occupational situations and they are viewed from the standpoint of the employee who has to act in that situation. Core problems are characterised by uncertainty and the weighing up of conflicting considerations and interests in complex situations. In these complex situations, one cannot resort to routine actions, and choices have to be constantly made anew.

Core problems embody the context of an occupation. What is attractive in core problems is that many qualifications have to be deployed for solving core problems. Or, as Onstenk (1997a) expressed it so well: 'core problems emphasise a holistic approach to the occupation.' Moreover, core problems provide the opportunity to contextualise an occupation. Onstenk says: 'The term core problem is intended to be an integrated concept, where the context in which the employee works forms an essential part of the occupation.... Core problems define characteristic, central occupational situations. They are in that sense interesting to education and training: the core of an occupation is demarcated, the content of the occupation is arranged and selected, the position of the employee as an individual who must take action is of central importance. Core problems should therefore contribute to determining the content of vocational education and training (1997a).

Using these insights as a basis, we want to study if it is possible and useful to formulate core problems, and the qualifications which an employee must possess in order to solve them, in a specific sector and within a number of selected occupations.

Research question

What are the core problems of service managers, receptionists and diagnostic mechanics in garages. And how can they systematically be described.

Method

On the research path to the core problems of the service manager, the diagnostic mechanic and the receptionist, we have gone through five phases: (1) choice of the sector, (2) literature search, (3) guidelines for conducting interviews, (4) conducting the interviews and (5) a validation process (Blokhuis & Van Zolingen, 1997).

Why was the car repair sector choosen? At the beginning of the 1980s developments in the car repair sector gained momentum. Rapid expansion of micro-electrical systems in car technology; modernisation of workshop technology, in particular, the introduction of computer-controlled measuring and testing equipment, the introduction of new forms of logistical and administrative automation, and changes in the sales market for cars, all had a great effect on the supply of work and the organisation of work in garages, and on the job content and qualifications required (Warmerdam, 1993). These developments continue to occur in rapid succession, and it is difficult to predict what qualifications car mechanics will need to have in future (Spöttl, 1995). An approach focussing on core problems would therefore appear very suitable for this sector.

Three occupations were studied: the diagnostic mechanic, the service manager and the receptionist. Apart from these qualifications, the job of receptionist was studied, because this job displays interesting contrasts with the other two jobs. First a literature search was conducted into trends in the repair sector, their consequences for jobs in garages, for the qualifications required, and for training in the car repair sector. Furthermore, a brief study was carried out in the area of core problems. Secondly for this study were a total of thirty interviews conducted in twenty

garages with service managers, receptionists, and car mechanics, among others. This study was actively supervised by INNOVAM (the central training facility in the car sector). General data were collected about the occupations and about these employees' work experience, education and training. The core problems of employees were mapped out by conducting a systematic inquiry into the principal tasks of the employees and, as a part of this, into the situations and moments when choices had to be made and decisions taken, where it was not possible to resort immediately to routine actions. Subsequently, questions were asked about the explicit combinations of knowledge and skills that were necessary to solve these core problems. Thirdly on the basis of these interviews, a number of trends and developments in the car repair sector were described. The principal tasks of the occupations of service manager, receptionist and diagnostic mechanic were described, several core problems of the employees (the dilemmas that play a significant role when carrying out their occupation), and the qualifications that the employees needed to solve these core problems. In the fourth place on the advice of INNOVAM, the core problems formulated were submitted for validation to a panel of two experts employed in the area of training in the car repair sector. The experts were requested to assess the recognisability and relevance of the core problems and the qualifications needed to handle them and, where necessary, to make suggestions for adjustments.

Results

Firstly, definitions are given of all three occupations, followed by the core problems with which the employees are confronted in their everyday work and, finally, the qualifications which they must have to solve these core problems. The core problems were characterised on the basis of two aspects: the area of tension in which they occur and the content of the problem. By 'area of tension' is meant the choice between opposites, such as, the choice between time and quality, or the choice between the interests of the customer and the interests of the garage. The description of the content of a core problem gives a concise reproduction of the concrete problem.

Service Manager : a General Definition The service manager bears final responsibility for the workshop of the garage. He is the contact between workshop, reception and after-sales (qualifications: broad technical know-how and experience, at least a diagnostic mechanic and, possibly, a technical specialist, good social skills and a good judge of character). The service manager is increasingly becoming a manager. A service manager must find it a challenge every day anew to please everyone, both the paying element (customer, employer) and the working element (car mechanics). In the process he will, ideally, try to strike a happy medium. This is a distinctly all-round occupation. The service manager is the kingpin in the garage. He is, for example, the person to speak to if a problem arises in the workshop or threatens to arise, or if something needs to be improved.

Frame 1 Principal Tasks of the Service Manager (a concise reproduction)

-To supervise the car mechanics in the workshop.
-To provide technical support to the car mechanics in the workshop.
-To allocate work to the car mechanics in the workshop and keep them busy, in close cooperation with the reception, the warehouse and the sales department.
-To motivate the car mechanics in the workshop.
-To create a good working atmosphere in the workshop, by ensuring that the car mechanics help or support each other, where necessary.
-To monitor and keep up the level of productivity of the workshop by having an overall picture of what is going on there: the workshop turnover, workshop hours and workshop costs, and by marketing promotion.
-To monitor the quality of the work turned out by the workshop, to convince the car mechanics of the importance of good quality and keep himself informed of customer satisfaction or dissatisfaction. Sales maxim:'The first car is sold by the salesman, but the second and subsequent ones are sold by the workshop.'
-To maintain the technical standard of the workshop.
-To act as instructor and make sufficient time free for this.
-If necessary, to step in as a diagnostic specialist in tracing and repairing complicated technical faults.
-To maintain good relations with customers. To assess customers correctly, to deal with customers openly and honestly: to reward customers when they are right and give the customer the benefit of the doubt, to show understanding for the customer's position, to give the customer a comprehensive explanation, if required, possibly to suggest or make a financial arrangement with a customer who cannot pay immediately; in short, to do as much as possible to retain the customer. A service manager remarked: 'You have to try to follow what a customer means at

this particular moment. His train of thought about a problem can vary from day to day. You have to help people decide whether to do something or not, by explaining and sometimes by offering an alternative. You do your best to help the customer drive the car as well and as cheaply as possible.'
-To maintain a good relationship with the shop manager.
-To maintain a good relationship with the other departments, such as the warehouse, the reception and sales.
-To supervise the workshop on environmental matters, to ensure that harmful substances are removed correctly.
-To formulate a personnel policy (engaging apprentices, job placement trainees and car mechanics).
-To deal with damage himself and/or pass it on to a specialist workshop.
-Possibly, to help with repairs himself (small garage) when it is very busy (medium-large garage).
-To deal with administrative work, to ensure that work orders are dealt with properly, also to supervise implementation and compliance with ISO standards if these are in operation in the garage (a couple of garages had just introduced them).

Frame 2: Core Problems of the Service Manager (a concise reproduction)

I Area(s) of tension: time
Content: A service manager may be faced with several different problems (technical and communicative) at the same time. He must be able to adopt a flexible attitude in this situation.

II Area(s) of tension: interests of the customer versus interests of the garage, time versus quality; money
Content: A service manager may be faced with a complicated fault. He must be able to deal with a complicated fault to the satisfaction of the customer and his garage.

III Area(s) of tension: quality versus money; short-term interests versus long-term interests
Content: A service manager may be faced with the purchase of new equipment and tools for the workshop. He must be able to strike the right balance between economy and quality when making these purchases.

IV Area(s) of tension: quality versus money; short-term interests versus long-term interests
Content: A service manager may be faced with a (imminent) shortage of know-how in the workshop. He must be able to ensure that know-how in the workshop remains up to the mark.

V Area(s) of tension: interests of the employees versus interests of the garage, own interests versus interests of employees; quality versus money; short-term interests versus long-term interests; organisation of work.
Content: A service manager may be faced with poor quality work and/or low productivity from the workshop. He must be able to supervise the car mechanics effectively, so that they work optimally, taking as the basic aims good quality work and high productivity.

VI Area(s) of tension: interests of the customer versus interests of the garage; own interests versus interests of the customer; short-term interests versus long-term interests; being creative in following the garage rules.
Content: A service manager may be faced with customers with complaints. He must be able to gain and retain the confidence of these customers.

Receptionist: a General Definition The receptionist maintains good contacts with customers and with the workshop and is able to make quick diagnoses. He advises the customer about maintenance and all other matters relating to the car. He makes a quick diagnosis of the faults reported by customers and translates these into work orders. In close consultation with the service manager, he sees to the car mechanics' work planning. As far as the content of his job is concerned, he has become a service adviser. He is also responsible for as high a return as possible from after-sales (service and spare parts). He is the representative of the garage to the outside world and sells services. In

addition, he must be able to calculate (cost estimation and subsequent costing, estimate hours and sales), and he is a manager of relationships (retaining, attracting and winning back customers).

Frame 3: Principal Tasks of a Receptionist (a concise reproduction)

-To make a quick diagnosis of a fault reported by a customer. To distinguish vague faults from simple ones. To clarify vague faults by asking further questions, possibly with the aid of a short questionnaire (diagnosis form) and/or by calling in the help of the service manager.
-To sell repairs, services, inspections, accessories.
-To make an estimate for a repair.
-To translate the customer's wishes into an assignment for the workshop.
-To see to substitute transport.
-To plan work, plan the workshop hours available per car mechanic and estimate the workshop hours expected to be needed for an assignment by a car mechanic.
-To allocate the work to the car mechanics (possibly in consultation with the service manager).
-To maintain contacts with the customer about extra costs of a service or a repair.
-To deliver cars to customers. To provide an explanation of the repairs, if requested.
-To register customers' complaints. To report faults which have not been repaired to the service manager.
-To invoice work orders. To do the administration of the work orders.
-To maintain contact with the after-sales team and the workshop manager.

Frame 4: Core Problems of the Receptionist (a concise reproduction)

I Area(s) of Tension: time versus quality; quality
Content: A rapid diagnosis must be made, based on the customer's complaint and this must be clearly worded on a work order.

I Area(s) of tension: interests of the customers versus interests of the garage, own interests versus interests of the customer.
Content: The receptionist also has to deal with difficult, angry and demanding customers. He must be able to deal with these customers in such a way that both the customers and the garage are satisfied.

Diagnostic Mechanic a general definition The diagnostic mechanicis able to apply technical know-how when making diagnoses, repairs and maintenance. In addition to broad technical know-how, he also possesses specialist technical know-how. He is well-informed about the latest developments in the use of electronics in cars. He is the person in the garage par excellence who makes the difficult diagnoses. He supports other car mechanics, possibly with his technical know-how, for example, in repairing faults, or as instructor.

Frame 5: Principal Tasks of a Diagnostic Mechanic (concise reproduction)

-To locate a fault and give a car mechanic the assignment of repairing the fault, possibly with the help of a repair plan.
-To give advice on repairs to other car mechanics.
-To pass on knowledge to other car mechanics. To supervise apprentices.
-To keep up and further extend his own knowledge by following courses,
-To ensure that the workshop equipment is up to standard,
-To help achieve an improvement in the quality of the work in the workshop,
-To behave in a customer-friendly manner when a customer comes to the workshop or when a test drive has to be made, in connection with a complicated fault.
-To carry out repairs,
Possibly help to work on:

-Delivery of new cars
-Delivery of used cars,
-Fitting accessories
-Finishing off services (when it is very busy).

Frame 6 Core Problems of the Diagnostic Mechanic (concise reproduction)

Area(s) of tension: quality; time versus quality
Content: A complicated fault occurs (unknown problem or a recurring problem). The diagnostic mechanic must be able to make a systematic search for the fault, to make a diagnosis and then to repair the fault himself, or to have a car mechanic repair it using a repair assignment.

Table 1
Areas of Tension of the Service Manager, Receptionist and the Diagnostic Mechanic

	Service manager	Receptionist	Diagnostic mechanic
time	x		
quality	x	x	x
time versus quality	x	x	x
money		x	
quality versus money	x		
interests of garage versus interests of customer	x	x	
own interests versus interests of garage	x	x	x
short-term interests versus long-term interests	x		
being creative versus following garage rules	x		

The core problems of the various employees within the car sector differ in degree of difficulty and in nature. As an employee in the car repair sector with a secondary school education develops in his career (from car mechanic, first car mechanic, diagnostic mechanic, receptionist to service manager) the core problems with which he is confronted in the first place become more complicated and he must possess a somewhat broader package of qualifications, which he must be able to apply in more complex situations, in order to be able to continue to perform well. In the second place, an employee who continues to grow will be faced with other core problems. A car mechanic must, for example, know exactly how he can best set to work on a major service. For him, solving core problems relates in particular to the fast and efficient performance of routine actions, repairing complicated faults that have been diagnosed by others, and making simple diagnoses. On the other hand, a diagnostic mechanic has to make diagnoses of faults in cars that are sometimes complicated. This calls particularly on his cognitive abilities for solving (technical) core problems. The receptionist has to deal with core problems of a technical nature, that are less complicated than those of the problems of a social nature. He has a great deal of contact with customers who are demanding and very critical and who all wish to be treated attentively. Furthermore, he sees to the planning of the work for the car mechanics in the workshop, in close cooperation with the service manager. Finally, a workshop manager is responsible for all the problems that occur in the workshop or are related to it. He solves these himself or in consultation with other people. The most charateristic core problem of the service manager is to be able to judge which problem to solve first. Being able to set priorities, and good time-management are, in addition to excellent social skills and technical insight, the essential qualifications which a good service manager must have.

Conclusion

From the study into the car repair sector it emerges that the formulation of core problems is possible and gives an insight into the complexity of the world of work. In addition, the core problems provide an insight into the various

combinations of knowledge and skills which an employee in the car repair sector must have in order to be able to work well in his occupation. Core problems shed light on the areas of tension in which an employee must be able to work in his occupation. Consequently, they provide the opportunity to 'contextualise' an occupation. We are of the opinion that these core problems which mirror the everyday world of work, should also be directional for training of employees in the future. In particular, the breadth and complexity of the employee's everyday reality are portrayed through these core problems more clearly than before. Core problems can serve as the basis for future on the job training by 'coaching and mentoring' employees to handle and reflect upon core problems, insofar as one can 'practise' core problems without jeopardising the production processes, and as long as there is good supervision in handling them. If the production process does not permit this, training courses in which 'artificial' core problems (simulation) are handeled and reflected upon can in the future provide opportunities.

How Can Firms Improve Sales Performance?

Camille M. Busette, Ph.D
AchieveGlobal

Do firms which inhabit different market share positions in their respective industries confront different sales training needs? It is the main argument of this paper that, regardless of the firm, sales training must overcome very similar problems. In other words, the challenges that generally motivate firms to engage in sales training are similar across firm type. This paper is based upon the results of focus groups conducted by AchieveGlobal in 1998.

Keywords: Sales Training, Business Strategy, Performance

Do firms which inhabit different market share positions in their respective industries confront different sales training needs? According to (Gutteridge, Liebowitz, and Shore, 1993 and Mann, 1990), many corporations generally recognize the importance of linking Human Resources Development (HRD) practice to business strategy. However, the distinct texture of the ways in which firms pursue the linkage between HRD practice and business strategy is largely a function of the market share position a firm inhabits in its industry (Raghuram, 1994). Miles and Snow (1978) have identified three general types of firms, according to market share position: defenders, analyzers, and prospectors. According to this classification scheme, defenders enjoy a relatively stable product market while prospectors, continually search for new products and markets. Analyzers, the authors argue, are firms that operate in two markets, those characterized by stability and those which are continually changing.

Because defenders operate in a relatively stable product market domain, these types of firms focus on increasing the efficiency of their production rather than on changing their structure, inputs, or operations. But because prospectors continually search for new markets and product opportunities, these types of firms tend to focus more on innovation in products and markets rather than on efficiency. Analyzers operate in two distinctly different product markets, one that is characterized by change, the other which is relatively stable. As expected, in the stable markets of operations, these firms tend to adopt the same foci as defenders, while in their more fluctuating markets, they adopt similar emphases to that of prospectors (Miles and Snow, 1978). Because the analyzer firms use a synthesis of these two types of HRD practices, I will not discuss them as a separate type from here on in.

These differences in business strategy imply differences in approaches to HRD practice. Raghuram (1994) argues that defenders pursue the following HRD practices: they emphasize functional expertise, place great stock on the development of internal talent and emphasize training that results in very specialized knowledge and process based quality improvements, particularly in the finance and production functions. According to Raghuram, prospectors tend to hire those who are already well trained, and then focus any training efforts on broad skills and on marketing, sales, and R&D functions.

In general then, the literature which links HRD practice to business strategy has tended the emphasize the fact that businesses which occupy different positions vis a vis their markets, will pursue distinctly different HRD practices. Given the logic that underpins this argument, we would expect that defenders, analyzers, and prospectors would confront very distinct challenges in the sales function. One would expect, for example, that defenders would have to defend market share, and thus, their sales challenges would center around how to retain existing clients. One would further expect that prospectors, on the other hand, would continually troll for clients. Their main sales challenge would be enticing new clients to contract with them. However, this distinction in the challenges faced by firms occupying different market share positions is not substantiated. Rather, it is the main argument of this paper that, regardless of the firm, sales training must overcome very similar problems. In other words, the challenges that generally motivate firms to engage in sales training are similar across firm type.

What we want to know therefore, is, what are the main challenges that firms will face in the next five years in their sales functions and furthermore, what are the appropriate training interventions that will help firms overcome these challenges. This paper reports on the results of focus groups that AchieveGlobal conducted at a major conference among human resource professionals to explore issues surrounding challenges for the sales function and for conducting sales training.

Copyright © 1999 Camille M. Busette

Methodology

We conducted 2 focus groups with a total of 23 participants at a human resource conference in May 1998. The participants were selected from the conference list of attendees in such a way as to maximize the variety of industries represented. Focus group participants were either human resource professionals or high level managers who were responsible for developing training programs for some portion of their employee population, from a wide spectrum of industries including banking and finance, insurance, defense, retail, non-profit, pharmaceutical, telecommunications, and hospitals within the United States. The participants represented a variety of firm sizes and market share position. Ten of the 23 participants were employed at firms with more than 200 sales people in the organization. One of the participants represented a firm with less than 10 sales people, while another represented a firm that had between 100 and 200 sales people. A further two participants came from firms with between 10 and 49 sales people and a another two came from firms which employed between 50 and 99 sales people. Please note that because the sample size is small, the results should be viewed more as qualitative than quantitative in nature.

Research Questions

The purpose of conducting the focus groups was to determine what sales function issues organizations are currently facing and if they are different than those issues faced in the last few years. Some of the research questions we posed to focus group participants were the following:

- In the next 3-5 years, which of the listed items do you anticipate as the most important issue facing your sales function?
- What steps or actions does your organization plan to take, to address these challenges?
- In what ways are customers' expectations of sales people different than they were 5 to 10 years ago?
- One recent research study reports that 80% of an organization's sales are generated by 20% of the sales force. What are the skills and characteristics of these people, as compared with others sales folks in your organization?
- Of the above-mentioned skills, which are more critical for the future?

Results and Conclusions

The main finding of the focus groups is that, retaining customers and building their loyalty to a particular firm is largely a function of the degree to which the sales person can meet a customer's increased expectations and build a relationship of trust with that customer. In order for sales associates to retain their client base and to enhance that base over time, they will have to find ways to be efficient with the customer's time while providing the best service and building an enduring positive relationship with the customer. This observation was shared by participants across industries and regardless of the size or market share of the firm. Many participants indicated that their primary customer related challenge was to provide added value to the customer in the context of increased competition and a customer base which is increasingly pressed for time. In general, it was agreed that currently, customers do not have a lot of time to spend with sales people. Thus, in order for sales associates to retain their client base and enhance that base over time, they will have to find ways to be efficient with the customer's time while providing the best service and building an enduring positive relationship with the customer.

When asked to comment on the necessary skills to meet this challenge, many respondents identified a disciplined, efficient approach, success at building positive, long term relationships with customers, and personal motivation as the competencies that characterized highly successful sales people in their organizations. Participants also stated that gaining a customer's trust and achieving in-depth product knowledge were critical skills for the sales function in the future.[1] Again, these observations were shared by participants across a wide variety of industries.

It is the contention of this paper that regardless of product market position, firms across the U.S. face the same set of challenges in the sales function. While the customer of 3 years ago might have been satisfied simply with excellent product knowledge, the customer of the future will now expect the sales person to meet his/her expectations of excellent service product knowledge and efficient use of limited time as well. Responses from our

focus group participants suggest that this challenge is consistent across industry type and market share position. Moreover, managers who participated in the focus groups indicated that the primary strategy for retaining and enticing customers was to build a long term trusting relationship with the customer. Hence, the sales function is now primarily one which will generate revenues by creating a loyal, well-served customer base. The development of strategies that lead to a long-term relationship with the customer is the key thrust of the sales function across the industries represented by these respondents.

It is important to note that, currently, firms pursue different types of sales training initiatives, but that all were searching for sales training that would render their sales staff successful at developing enduring positive relationships with customers. Thus, while firms may differ with respect to how they approach training, the competency content outside of the product specific content is, according to our focus group participants, likely to be quite similar.

As economies slow globally and as competition remains keen for customers, most firms must devise ways to maintain profits at current levels. The most desirable method for doing so is to improve revenue. Often, improving revenue entails improving the sales performance of their field forces. The main challenge of sales training will be to provide sales people with the competencies that allow them to develop trusting long-term relationships wit their clients. Thus, a firm's ability to improve sales performance will rest on the degree to which it is successful in imbuing its sales staff with the necessary competencies identified in this study.

Contribution to HRD

This conclusion is important to HRD in that it isolates the simultaneous stresses that sales people face and suggests that training initiatives in the sales function should target the specific challenges noted, as well as the simultaneity of those challenges. The sales person of the future must be efficient, knowledgeable, and must be skilled at creating a positive relationship with the customer that leaves the customer highly satisfied.

Limitations

As mentioned earlier, this paper is based upon a small sample and the conclusions should therefore be considered qualitative rather than quantitative. The participating organizations, however, tended to have a good deal of experience with sales training and were from a wide variety of industries and organizational sizes. In addition, It is important to note that most respondents were managers and that as noted in endnote 1, mangers views of the necessary competencies for success in sales often diverge from that suggested by objective criteria (Vinchur, et al; 1998).

Performance- and Learning Support With On-line Help Systems: An Effectiveness Study

Theo J. Bastiaens
Open University of the Netherlands

Jan N. Streumer
University of Twente

Yvette Krul
Origin Human Performance Consulting

This study is on employees working in the field of production, planning & engineering and inventory, who depend heavily on a computer for carrying out their tasks. To cut training expenditure the company developed and implemented an on-line help system for all their questions and training needs. The researchers monitored the implementation phase for six months and looked at the usability and effectiveness of the help system in terms of the learning results and the performance improvement of employees.

Keywords: Performance Support, On-Line Help Systems, Effect Evaluation

When equipping the work environment with resources, there is an increasing use of new technologies. A very common way to integrate working and learning with new technology is providing employees on-the-job with programs to process data, for on-line reference, for electronic advice and -training. Some concepts as for example the concept of Electronic Performance Support Systems (EPSS) go further than the provision of stand alone programs and provide a complete integrated electronic environment (Gery, 1989). The goal of all the effort is a better working and learning process. It is based on the assumption that learning this way will create a more active learning process, more concrete forms of learning, an increase in the transfer of what was learned to the job and a reduction in learning time. Another assumption has to do with the expected performance enhancement of individual employees and the organization and refers to higher quality products and processes and productivity growth (Bastiaens, 1997).

Research Questions

In the previous section assumptions on the advantages of working and learning electronically have been mentioned but little has been empirically proven. On the contrary, next to these assumptions also possible disadvantages were found in the literature that could affect the effectiveness. The first disadvantage is related to the learning process. "Just-in time" training at the workplace, providing employees with small task-oriented training granules and employees taking control of their own learning process can create work behavior problems. Clark (1992) argues that employees may fail to build a unified picture of their job when they have to extract information from a help system. Several small information parts will create a fragmented knowledge base. Novices especially need a high level overview of the content to relate details of training. Clark also has her doubts about the learner control and she illustrates this with the research of Milheim and Martin (1991) which indeed proves that learner control is not as effective as instructional control. This means leaving learners to their own devices and let them make their own decisions is not as effective as let the computer environment taking over control and provide a predefined and structured route (for example with CBT).

An other possible disadvantage is related to the performance support and the work that has to be done. Is the support adequate? Will "just-in time" support "de-skill" workers? Will it "demotivate" workers? Or will it automatize the low level tasks and as a result give workers the opportunity to concentrate on high level tasks (Carr, 1992)?

While these issues provide many questions, the study reported here focuses on the following main research question: "What is the effect of on-line help systems on the performance and learning of the employees."

Copyright © 1999 Theo J. Bastiaens, Jan N. Streumer, and Yvette Krul

The Research Setting

The research was done in cooperation with a large Dutch manufacturing firm with 2700 employees. Together with new working procedures and new computer software, they also introduced an on-line help system for the support of 300 employees at the departments Production, Planning & Engineering and Inventory. From this population 4 jobs (planning engineer, planner, coordinator and warehouse employee) were selected to participate in this research project. A planning engineer supports and prepares orders. He determines the sequence of steps and appropriate equipment. A planner coordinates technical activities and takes care of manufacturing orders. A coordinator takes care of the logistics and also supervises the whole project. A warehouse employee is at services of the different departments and projects. After a selection of these 4 jobs, 103 employees participated in this project, 50 planning engineers, 26 planners, 4 coordinators and 23 warehouse employees.

The main purpose of this study is to evaluate the existing computer environment and monitor the implementation of a new help system. The whole study consists of three parts: (1) an effect evaluation of the basic training as well as the on-line help system immediately after implementation, (2) an effect evaluation of a functional refresher training as well as the help system three months later, (3) measuring the reactions and opinions of end and key users concerning the whole training trajectory and on-line help system. This paper will only examine the second part and focus on the effect evaluation of the on-line help system. The competency of employees is evaluated and the following three hypotheses are tested: (A) Employees have a higher score on a case in their own field of expertise than on cases in related fields, (B) Employees with an on-line help system score higher on a case in their own field of expertise than employees without an on-line help system, (C) Employees score higher on the learner test, after three months working with the help system than on a pretest.

Methodology

The second part refers to a summative evaluation three months after implementation of the on-line helpsystem and after a specific refresher training course in the field of their own expertise. Employees (n = 30) from the above mentioned areas in the division Operations are being asked to solve problems in the their own field of expertise (by means of a case study), but also in three other related fields. This is done because the company has the policy to broaden the present tasks of employees. From this group, 11 employees took part in an observation. In Figure 1 the quasi experimental design (a randomized block design) is diagrammed.

O1	X1	O2	O3
O1	X2	O2	O3
O1	X3	O2	O3
O1	X4	O2	O3

O1: Pretest, 8 questions (n = 30)
X1 – X4: Treatment consisting of four cases in every field of profession (n = 30)
O2: Observation (n = 11)
O3: Learning test (n = 30)

Figure 1. Research design of the study.

In the pretest 30 employees are requested to answer 8 open questions (declarative and procedural). They have to respond to the answers without the support of the on-line help system. The pretest is used as a reference measurement for the learning test.

After that, the employees from the earlier mentioned areas in the division Operations have to solve problems in the their own field of expertise (one case), but also in three other related fields (three cases). The cases are developed in collaboration with key-users. These key-users are experts in a specific field. The cases are

exemplary for their daily tasks. The employees have 20 minutes to solve each case. The key-users are reviewers and they will assess all the results on the cases.

It is expected that (1) employees after a specific refresher training course in the field of their own expertise will have the competence to solve a complex case within 20 minutes; (2) employees will score better on a case in the their own field of expertise; and (3) employees using the on-line help system will score higher than employees without a help system. During their work on the cases, 11 employees will be observed by key-users. The key-users analyze in detail how the employees work with the on-line help system and when they need more information.

Finally, the employees have to sit for a learning test. The test exists of exactly the same sort of questions as the pretest (from a database, all the questions were randomly assigned to the pretest or learning test). The results on this learning test are compared with the results on the pretest. It is expected that employees in the learner test with the on-line help, will score higher than before, without the on-line help system.

Results

Before the hypothesis about the competence is tested, the key-users were asked the question "What makes an employee competent?" According to these key-users, it will not be necessary for employees to solve every problem themselves. There is no need to know everything exhaustive. Therefore, the score on the case has a minimum mean score for competence. A coordinator is competent when he has a mean score of 18.6 points on the cases, a planning engineer needs 24 points, a warehouse employee needs a mean of 25.8 points and a planner has to have a mean score of 27 point. The expectation was that employees after a specific refresher training course in the field of their own expertise will have the competence to solve a complex case within 20 minutes. Table 2 shows the results.

Table 2

Mean Score and Standard Deviation on Cases

	n	M1	s.d.	M2	s.d.	M3	s.d.	M4	s.d.
Planning engineer	8	5.4*	6.5	6.1	8.3	1.6	1.6	6.3	5.8
Planner	11	6.5	7.3	4.9*	8.2	2.6	3.6	4.1	5.1
Coordinator	4	7.5	5.3	2.5	5.0	10.3*	1.5	6.4	4.1
Warehouse employee	7	3.0	6.0	7.9	4.5	2.9	3.8	11.0*	7.8

M1 = mean score on case, field planning engineer (maximum point 40)
M2 = mean score on case, field planner (maximum point 45)
M3 = mean score on case, field coordinator (maximum point 31)
M4 = mean score on case, field warehouse employee (maximum point 43)
* = mean score on case in the own field of expertise

The results on the cases are extremely low. Although the employees all had a specific refresher training course, their score three months after implementation of the help-system is far below expectation. No group meets the demands set by the key-users. No group could give a solution to a case within 20 minutes. It is noticeable that a planner and planning engineer has higher results on other fields than their own. This makes the following hypothesis hard to accept.

It was expected that employees have a higher score on their own field of expertise. To test the hypothesis, all scores are standardized first into Z-scores. After a comparison of the Z-score on a case in their own field of expertise (M = .35, s.d. = 1.21) with a Z-score on a different field (M = -.12, s.d. = .66) a significant difference appears (t-test, t = -2.23, n = 30, en p = .02). Contrary to the results of the planners and planning engineers, the hypothesis will not be rejected. Thus, employees score higher on a case in their own field of expertise.

To evaluate the surplus value of the on-line help system, the group of employees was randomly split into two conditions; 15 employees were allowed to use the help system when they were working on the case in their own field of expertise, the other employees were not allowed to use the help system while working on a case in their own field. *The hypothesis was that employees with a help system score significantly higher on a case in their own field of expertise.* The employees with a help system had a mean Z score of .28 (s.d. 1.15), the mean Z score of the group without a help system was .43 (s.d. 1.29). The t-test on these results showed that there is no significant difference between the two groups (t = .33, df = .28, p = .37). The value of the on-line help system was not evident.

To test the learner results, the employees had to answer 8 open questions in a pretest without the on-line help system. The 8 questions were derived at random from a data bank with 16 questions. After the implementation of the on-line help system they had to answer these questions again. Now they had to answer all 16 questions. This time they were allowed to use the help system. The different score between the two test is interpret as learner results. Table 3 shows the data in the pretest and on the learner test.

Table 3

Mean Score and Standard Deviation on the Pretest (M1) and Learner Test (M2)

	n	M1	s.d.	n*	M2	s.d.
Planning engineer	8	4.5	3.1	5	16.6	5.2
Planner	11	6.2	3.5	9	22.3	10.8
Coordinator	4	11.1	7.5	3	22.0	10.7
Warehouse employee	7	10.6	5.3	7	25.5	14.4

M1 = mean score on pretest (maximum point 40)
M2 = mean score on learner test (maximum point 80)
* = the learner test was not completed by 6 employees

To compare the pretest with the learner test first all scores were standardized into Z scores. *The hypothesis was that the employees score higher on the learner test then on the pretest.* The results on T-test ($t = 4.45$, $df = 23$, $p = .001$) are significant. The employees score higher on the learner test after implementation of the help system.

Next to this quantitative measurement 11 employees were observed while using the help system. In spite of a functional refresher training containing a practical component (using the help system) it appears that not all the employees can be qualified as expert. Many of them have problems while working. The learning part comes in the second place. While observing three employees still have problem to start the on-line help system. Although the content is complete some links from the list of reference to a certain topic fail. It appears that the most important and mostly used feature is the "search engine" (44%). "Activity scheme per field" (28%) and "work instructions per job" (25%) are also used often. In general, the employees told us to be content with the on-line help system. They especially like the on-line support. Whenever they have a problem, they can look for information. This is at odds with the sporadic use of the help system. Reasons for the non use vary from "to many mistakes in the help system" to "a preference for books." The information that is looked up, is basically procedural knowledge. Employees do not use the help system to learn more or look for background knowledge. On the question what information is lacking in the help system no univocal answer is given. Most employees do not know what information they really want to see in the help system. They told us that they need up-to-date information in a complete system with different possibilities for search and retrieval.

All employees are in general positive about the impact of the help system. They believe that the on-line help system will stimulate a more effective performance. Although we will not elaborate on the third part of this study (a questionnaire) it is interesting to see the same results in a larger measurement (N=67). Table 4 shows the answers of the employees on the item "Traditional handbooks and materials are more effective then the on-line help system.."

Apparently there is a difference between the perceptual and the measured effects (see results on cases). When the respondents were asked about the critical success factors for the use of on-line help systems it appeared to be the completeness of the information that was seen as most important. Figure 2 shows the frequencies on the seven most important factors.

Table 4

Results of the Respondents on the Item "Traditional Handbooks and Materials Are More Effective Than the On-Line Help System "

	Traditional handbooks and materials are more effective then the on-line help system	
	N	%
Strongly disagree	16	23.9
Disagree	13	19.4
Neutral	15	22.4
Agree	15	22.4
Strongly agree	8	11.9
Totals	76	100.0

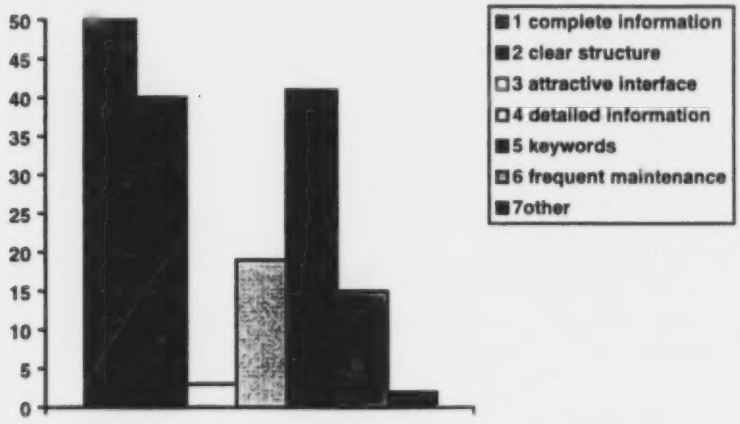

Figure 2. Frequencies in the critical success factors.

The second critical success factor appears to be the possibility to search on key words. Respondents also think that it is important that the on-line help system has to have a clear structure, not to much layers etc. Least important is the graphic design of the interface. They think that a glossy appearance is not critical for the use of the help system.

Regarding a question about a successful implementation and becoming familiar with the on-line help system, Figure 3 shows the results of the respondents. The most important factor for successful implementation is a demonstration of the features of the on-line help system. An information retrieval training making use of the on-line help system makes the help system become more familiar. Another important factor is "the time to practice". Employees need to get familiar with the help system. They want to try and test the help system off the job. Giving them time to learn the help system themselves is also important. The third in row is the integrated use of the help system during functional training. Whenever employees get a functional training, let them use the help system as a tool. The least important is the exhaustive topic list.

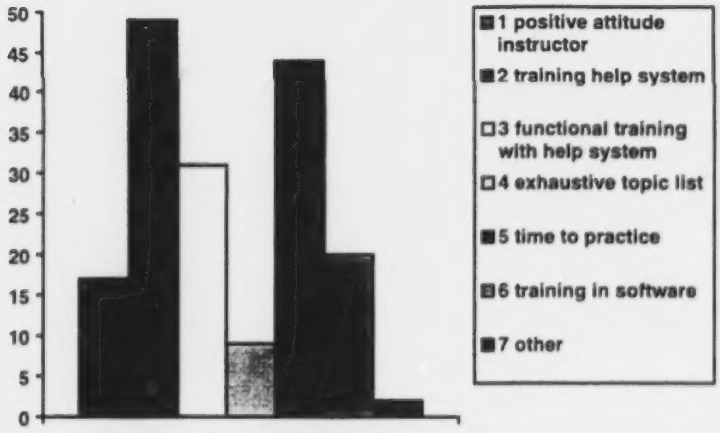

Figure 3. Success factors for the implementation and becoming familiar with the on-line help system.

Conclusions

In general this study shows again the relative impact of electronic sources for the learning process (see also Bastiaens, Nijhof, Streumer & Abma, 1995, 1996, 1997). Main reasons for these results depend often on technical defects as well as on content problems. Often a system is not ready for implementation. Technical problems make the system work with deficiencies, content is often not structured enough (only scanned text) or incomplete. Companies, even nowadays, expect employees to use electronic sources automatically. No attention is paid at the implementation process of electronic sources, at the training of information retrieval skills, or at the human interface. Employees do not use electronic resources inherently. Particularly with help systems it is important to learn more about the features and advantages of help systems. The expectations on electronic sources are often pitched to high. Precisely as in this project the company expected the help system to answer every need for training. The regular training program was cut down and the help system was developed separately from the general training. As the results show three months after implementation the performance of the employees on the cases is still below the required competence level. Even if it is recommendable to develop a on-line help system then a integrated development and use of the help system in the general training is important. Employees need to learn how to use an on-line help system.

Readiness of HRD Instructors to Engage in On-line Instruction

Chanidprapa Suriya
Tim L. Wentling
University of Illinois at Urbana-Champaign

Computer-assisted instruction has played an important role in both corporate and academic learning. The purpose of this study was to investigate the readiness of two groups of HRD professionals to engage in online instruction and use computer-mediated communication. Learner readiness focused on the contextual environment (e.g. computer hardware & software, accessibility to the Internet, and supporting environment to study); computer experiences; and attitudes toward Internet-based instruction and distance education. The results of this study are intended to (1) help designers and managers better understand learner environments and characteristics and (2) identify what should be incorporated as orientation in order to facilitate successful learning in Online instruction and computer-mediated communication.

Keywords: Online Instruction, Learner Readiness, Learner Analysis

The computer and the Internet are playing an ever increasingly important role as a delivery method for corporate training and academic instruction. Because of the interactive, multimedia capabilities of the World Wide Web (Web), Internet-based training is gaining popularity. According to the American Society of Training Development Benchmark Forum (1997), the percentage of companies using Internet/network-based electronic distance learning has increased from 12% in 1994, to 33% in 1995, and 53% in 1996. In addition, current popular and professional literature reveals extensive activity on the part of academic institutions to use the Web in the delivery of undergraduate and graduate instruction.

The Department of Human Resource Education at University of Illinois at Urbana-Champaign initiated two distance education programs in 1998. Both programs use computer-mediated communication (e.g. e-mail, synchronous chat, broadcast audio, digital archives) as a medium to facilitate learning. The programs are: (1) a worldwide program on Improving Training Quality through Post Training Coaching and Peer Mentoring (ITQ); and (2) an online master degree in Education with a Specialization in Human Resource Development. These programs are aimed directly at professionals in the HRD field.

This study attempted to assess the HRD professional readiness for both programs. The findings of the study have implications for the Human Resource Education Department regarding recruiting of students, setting of prerequisites for instruction, designing orientation sessions for new students, and designing of Web based instruction. Additionally, other HRD professionals who are planning online instructional activities can learn from the procedures and results of this study.

Problem Statement

The decline in the cost of personal computers, the increase in computer capability, and the simplification of access to the Internet have contributed to the growth of computer-based instruction. Many educators and trainers who use the Web as an educational tool assume that learners have access to e-mail and the Internet. However, there is a need for research in computer-based distance education to discover the computer and communication skills of students (Bizhan, 1996). The question of online learners' capability to effectively participate in this new type of learning remains.

The purpose of this study was to assess the readiness of students to use the computer applications and computer-assisted technologies used in online instruction of two groups: (1) participants in the Workshop on Improving Training Quality through Post Training Coaching and Peer Mentoring (ITQ) and (2) students of the Master of Education in Human Resource Education (HRE) Online degree program at the University of Illinois at Urbana-Champaign.

Research Questions

This study is guided by three research questions:

1. What is the contextual situation (computer hardware and software, accessibility to a computer and Internet, study facilities, support systems, and learning styles) of learners?
2. How experienced are learners in using computers?
3. What are the learners' attitudes toward Web-based communication and distance education?

Review of Literature

The basic concept of distance education is that instructors and students are separated by distance and that technology is used to deliver the instruction (Moore and Kearsley, 1996; Willis, 1993). Distance education has gained popularity as technology advances, especially in the computer and the Internet. Instruction, whether classroom or web-based, should be planned in a systematic process. Many have argued that Web-based instruction needs to be developed according to instruction design principles. The Internet, particularly the World Wide Web, with its interactive, multimedia capabilities created a new method to disseminate learning , however, teaching and learning through the Internet requires different types of preparation and use by instructors and learners (Porter, 1997).

Distance education can be as effective as the traditional classroom if the background and level of students is considered in selecting the delivery method (Willis, 1993). Students who first start in distance education usually have little or no experience regarding learning from a distance. They have anxiety about taking a distance course. Some might even assume that distance education, when compared to the traditional classroom, is of a lower quality. (Moore & Kearsley, 1996). Learner analysis provides instructors and developers with enough information to design, develop, and implement a distance class. Not only the computer knowledge and skills of students need to be assessed, but also their attitude toward the new type of learning. In a study of factors affecting students' success in distance education by Billing (1989), two of the six factors are attitude toward the distance course (e.g. satisfaction and difficulty with the course) and the students' environment (e.g. employer and family support). Threlkeld and Brzoska (1994) stated that learner characteristics play an important role in the distance student's satisfaction and achievement. Further, they urge that a learner analysis, including learner style, motivation, and background should be conducted before developing a distance course.

From the literature, the three most mentioned attitudes in distance education are (1) students' attitude toward new technology (2) students' perception of their capability to use technology or self-efficacy, and (3) the perceived relative advantages between distance and traditional education. Davis, Bagozzi, and Warshaw (1989) stated that learner attitude toward technology, the perceived usefulness of the technology and distance learning is important in the success of the learner in using computer-mediated communication. In addition, the self-efficacy, the belief that one has the capability to use a technology, plays an important role in users' expectations and satisfaction in using new technology (Webster & Hackley, 1997). The perceived relative advantage between face-to-face instruction and distance education is also important. Even though learners have a positive attitude toward the technology, they may not have the positive attitude toward the distance education. They might also think that the traditional classroom is more effective (Moore & Benbasat, 1991; Webster & Hackley, 1997).

Learner analysis is helpful to decide whether an orientation session should be included. It is desirable for distance students to have an orientation session where they can find out how the delivery system works and what is expected (Moore & Kearsley ,1996; Threlkeld & Brzoska, 1994). Bizhan (1996) also urged that a practical training program based on needs assessment is essential for the success of a computer-based distance education program. Once distant learners are comfortable with the technology, they will engage in learning and communication (Keegan, 1985).

Methodology

In order to reach all of the geographically dispersed subjects, a survey research method was employed.

Subjects

The subjects of this study were: (1) 31 ITQ workshop participants from 18 countries around the world; and, (2) 19 HRE Online students, all are US citizens and live around the Chicago metropolitan area and were enrolled in the HRE OnLine program during the summer of 1998.

Instrumentation

Three different instruments were used to collect readiness information from subjects. An application form and an online questionnaire were used for the international group of ITQ participants. A second online questionnaire was used with the masters students. The instruments are described as follows.

ITQ Application Form. In addition to general information about applicants (e.g. name, address, and experience), this form consisted of (1) 9 dichotomous response (yes/no) questions regarding computer operating system, e-mail and attachment capability, Internet connection, Web browser and software applications, and (2) six Likert scale items related to computer software application competencies.

ITQ questionnaire. This online instrument contained 34 questions as follows:

- 10 dichotomous response (yes/no) questions regarding Internet access, CD-ROM, sound capability, employer support, technical support, and past experience with Web-based communication.
- 1 checklist related to Web browser skill competency
- 20 Likert scale items regarding: computer competency (e.g. general use of computers, use of multimedia, group discussions, and World Wide Web); English skills in typing, speaking, listening, and reading; learner motivation; self-efficacy; and attitude toward Web-based training and distance education.
- 3 open-ended questions regarding e-mail, Internet, and technology problems that learners have faced.

HRE OnLine Masters Student Questionnaire. For the HRE online students, an online questionnaire was employed to address the research questions. The questionnaire consisted of 42 questions. The details of questions are as follows.

- 17 dichotomous response (yes/no) questions regarding the computer hardware qualifications, operating systems, e-mail and attachment capabilities, Internet connections, Web browsers, software applications, accessibility to computer and Internet, employer support, technical support, and past experience of Web-based communication.
- 5 checklist items related to the availability of various computer software programs and computer competency in using Web browsers, word processors, e-mail, and Microsoft PowerPoint.
- 19 Likert scale items regarding computer competency (e.g. general use of computer, use of multimedia, group discussion, World Wide Web, word processors, and Microsoft PowerPoint), learner motivation, self-efficacy, attitude toward Web-based training and distance education.
- 1 Open-ended question regarding technology-related problems that learners have faced.

Data Collection

The questionnaires were posted on the Web sites of both programs (ITQ workshop and HRE OnLine program Web site), and subjects filled out the questionnaires and submitted them electronically. In addition, the e-mail and paper versions of questionnaires also were made available. For the HRE online group, during the first class, which was a face-to-face class, the instructor informed students about the questionnaire and that the questionnaire was part of a voluntary assignment. After one week, the instructor followed up by sending an e-mail to HRE Online students and mentioned it during a synchronized chat hour of the class.

For ITQ subjects, the participants' application form was collected in the spring of 1998. Data were compiled, then the questionnaire was designed to gather the additional information. The ITQ Coordinator informed participants regarding the questionnaire via e-mail with a brief description of the Web site and the purpose of the questionnaire. Two weeks after the first e-mail, a follow-up e-mail was sent by the ITQ Coordinator.

Data Analysis

Collected data were analyzed using both quantitative and qualitative methods. The mean and percentages of the quantitative responses were calculated. A content analysis and categorization was used to analyze the answers from the open-ended questions.

Results

The average response rate was 88% (the response rates of the ITQ and HRD groups were 87% and 89% respectively). The major findings of this study were organized by research questions and are presented as follows.
Research Question 1: What is the contextual environment (computer hardware and software, accessibility, study facilities and support systems) of the learners?

All respondents indicated that they had an IBM compatible computer with a Windows operating system. The majority of respondents' computers are well equipped with sound and CD-ROM. All of them reported having Internet access. In terms of the learners' computer applications, all of them have a Web Browser. Only one respondent reported not having e-mail with attachment capabilities. The majority of respondents have word processor programs and database programs. However, only 48% of the respondents have a presentation program (see Figure 1).

Figure 1: Computer Equipment, software, and Internet

Computer Equipment, Software, and Internet	**% of respondents**
Window Operating software	100%
Sound	84%
CD-ROM	88%
Internet Access	100%
Web Browser	100%
E-mail with attachment	98%
Word Processor	87%
Presentation Program	48%
Database Program	75%

Most of respondents have an environment that supports the use of online programs (see Figure 2). Though 81% of the respondents are primary users of their computers, all reported having convenient access to computers, and 96% have convenient access to the Internet. Both programs reported the same result except the employer support, 96% of ITQ respondents received employer support, where only 65% of the HRE OnLine students had that support. In addition, the majority of the ITQ subjects (85%) had technical assistance available but only 24% of HRD students had that.

Figure 2: Participants' Contextual Elements

Contextual Elements	**% of respondents**
Primary user of computer	81%
Convenient access to computer	100%
Convenient access to Internet	96%
Own place to work for extended period of time	98%
Employer support	96%
Technical assistant available	65%

Regarding the problem of technical problems that participants have faced, ITQ respondents reported problems regarding the Internet such as limited access, limited Web browser skills, and technical problems with network and equipment.

Research Question 2: How experienced are learners in using computers?

On a competency scale of 1 to 4 (1 = poor and 4 = good), the respondents reported that their skills are high in terms of general use of the computer, search for information in World Wide Web, use of e-mail, and use of word processors (see Figure 3). However, their skills are less strong for use of CD-ROM and multimedia. Respondents

stated that they are least familiar with the use of the group discussion application such as electronic bulletin boards and chat rooms.

As for Web browser competency, most respondents are able to view and navigate the World Wide Web, and print web pages (see figure 4). Though the average of respondents who are able to use search tools is 60% , the difference between two group is apparent. About 71% of HRD respondents are able to use search tools versus only 50% of ITQ respondents. Both groups are less familiar with the advanced skill of Web browsers such as bookmarks, downloading programs from the Internet, and using plug-ins such as RealPlayer.

Figure 3: Participants' computer application skills

Computer Application Skills	Average Rating
General use of computer	3.36
Use of CD-ROM	2.86
Use of multimedia	2.57
Use of e-mail	3.25
Search for information (World Wide Web)	2.94
Group Discussion (E-Bulletin Board, Chat)	2.16
Use of Word Processor	3.53

Note: 1 = Poor, 2 = Below average, 3 = Average, and 4 = good

Figure 4: Participants' Web Browser Skills

Web Browser Skills	% of respondents
View and navigate the Internet	87%
Use search tool	60%
Bookmark sites and organize bookmark files	42%
Print Internet page	76%
Download program from Internet	48%
Use Plug-in such as Real Player to listen audio files	35%
Use Plug-in such as Real Player to view video files	29%
Use acrobat reader to open and read document .pdf files	25%

Research Question 3: What are learners' attitudes toward computer-mediated communication and distance education?

Learners seem to have a positive attitude regarding their use of computers and new technologies (see Figure 5). The respondents reported that they enjoy using their computer and the Internet. In terms of their motivation and learning characteristics, the respondents seem to agree that they are motivated to use new technologies and they are self-motivated and independent learners. One source of motivation is that learning about distance learning technology will support their career goal. As for the learners' self-efficacy, respondents reported that they are confident in their ability to do well with network-based communications and they will try new technologies even if they feel a little bit apprehensive.

In term of their attitudes toward computer-mediated communication and distance education, although the respondents appear to agree that it is not necessary to be in a traditional classroom environment to learn, they are not certain about the effectiveness of computer-based training when compare to a traditional classroom.

Basically, the results of this study focus on obtaining learner characteristics which help the design, development , and implementation of an online program. The strengths of responding groups is that they have computer hardware, software, and Internet access that enable the implementation of online programs and they are motivated and confident that they will do well with the technology. The weak point is their computer application skills especially with multimedia and Web Browsers. In addition, They have not been exposed to the use of the Internet as a learning method and they are not certain in the effectiveness and efficiency of web-based training. One implication is that an orientation should be designed to show participants how the new technology works. Also, Web Browser skills training should be provided in the orientation to help participants to be more efficient with the online instruction and reduce the frustration with new technology. The orientation will prepare to participate in the virtual environment and reduce their anxiety in taking online classes, thus, increasing their satisfaction with learning. Another implication for the implementation of online programs is that of technical support. With only 25% of HRD online

students having technical assistance available, the HRD Online program needs to provide sufficient technical support to the students.

Figure 5: Participant's attitude toward computer-mediated communication and distance education

	Rank
I enjoy using computer in general	4.48
Overall,, I enjoy using Internet	4.34
I am motivated to use new technology	4.54
I am confident that I will do well with network-based communication	4.48
When I am asked to use new technology, I will try them even if I feel a little bit apprehensive	4.58
I believe computer-based training via the web is as effective as traditional training	3.90
It is very important that the trainees and trainers are in the same room	3.10
If the class were to use a traditional format, it would be better	2.57
It is not necessary to be in a traditional classroom environment to learn	4.19
I am a self-motivated, independent learner	4.60
Learning about distance learning technology will support my career goals	4.55

Note: 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly Agree

Discussion

Learner analysis is very important to the design, development, and implementation of the online program. The analysis should not only look at the equipment, but also consider the skills and attitude toward the new technology. The more understanding of the learners, the better the online program can respond to the participants or customers needs. Thus, readiness of the learners is the stepping stone to the success of an online program.

Motivating Community College Instructors to Teach On-line: An Exploration of Selected Motivators

James J. Kirk
Western Carolina University

Harold Shoemaker
Indiana State University

This investigation explored differences in motivators for teaching courses on-line as reported by 405 instructors at 38 community colleges. Differences in reported motivators were examined with respect to age, gender, subject matter taught, knowledge of computers, knowledge of the web, prior experience with on-line courses, size of employing institution, and geographical location. The findings hold implications for organizations seeking ways to influence instructors to teach their courses over the World-Wide-Web.

Keywords: Web-Board Instruction, Community College, Motivation

The creation and rapid growth of the Internet, especially the graphical portion known as the World-Wide-Web, is changing how people learn (Green, 1996). For example, it is estimated that in the near future 25% of all community college students will acquire part of their education via the Internet and that community colleges will compete nationally/internationally for students via distance learning technologies (Morrison, 1995). Many community colleges already offer a wide array of courses, certificates and degree programs through various on-line delivery modes. Examples include Bellevue Community College, Brevard Community College, Clackamas Community College, Colorado Community College Online, Edmonds Community College, Greenville Technical College, Hawkeye Community College, Laramie County Community College, NorthWest Arkansas Community College, Pikes Peak Community College, and Vance-Granville Community College.

Some educators believe that community colleges of the twenty-first century will need to employ a variety of instructional delivery modes (Weiner, McVeigh, Clever, Brasington, & King, 1997). They hold that many students will be able to continue the traditional pattern which is to meet at regularly designated class times at a particular location. For many others, accessibility to educational offerings will be a major concern. Distance learning over the World-Wide-Web will be one way of addressing the access issue. However, many community college faculty have concerns about distance education and are reluctant to embrace its technologies. They are concerned about the impact of technology on their roles as faculty members (Monaghan, 1995). Resistance centers on several fears expressed by faculty--"fear of change, fear of time commitment, fear of appearing incompetent, fear of techno failure, fear of reprisals (Rutherford, 1997). Expressions of doubts by faculty should be viewed by planners as valuable input for developing successful strategies to motivate faculty to adopt technology in their teaching (Aiken, 1997).

Related Literature

If it is assumed that most community college instructors have a choice to teach or not to teach on-line and that Internet-Based-Instruction is a technological innovation, there are three bodies of literature particularly relevant to the subject of this investigation. They include individual decision-making, innovation diffusion, and motivation theory. With respect to individual decision making, Carney (1991) believes that people exhibit one of four decision making styles (i.e., confusion, dependent, intuitive, planful). According to Carney, persons exhibiting the confusion style make decisions out of "utter confusion." Dependent decision makers simply defer decisions to others. Intuitive decision makers base their decisions on "gut-level" feelings, where as, planful decision makers systematically make decisions based on relevant facts/options.

Decision making can also be viewed in terms of rational decision making, technological determinism, and praxis. The rationalistic view to decision making sees individuals undertaking extensive analysis of problems and

Copyright © 1999 James Kirk & Harold Shoemaker

opportunities prior to making a decision on a specific course of action (Forester, 1989). Technological determinism may be defined as the belief that one's future is being shaped by technology (Forester, 1989). Determinists see the decisions of people being influenced more by technology than individual free choice. The praxis view of decision making emphasizes the role everyday cultural practices play in individual decisions. It holds that individuals are socially emerged in culturally defined patterns of behavior and these patterns of activity shape the way people make decisions (Coyen, (1997).

According to innovation diffusion theory (Burns & Stalker, 1961; Harris, 1994: Marchwick, 1997; Rogers, 1995; and Surry, 1997), there are characteristics of any new technology that affect the likelihood of its adoption. They include relative advantage (e.g., is it better than the technology currently in use?), compatibility (i.e., does it fit into existing practices and beliefs?), complexity (i.e., can people understand it?), trialability (i.e., can people try it out before it is permanently adopted?), observability (i.e., can people see the operations and results?), and re-invention (i.e., can people modify it?). Research results suggest that the first three characteristics (i.e., relative advantage, compatibility, and complexity) have the most significant influence on the adoption and implementation of technological innovations (Klopfenstein, 1997).

One of the best known innovation diffusion theorists, Everett Rogers, (Sapp, 1998) believes the adoption of new innovations is affected by both the nature of the innovation itself as well as those considering its adoption. Rogers holds that adopters of innovation can be grouped into five groups; innovators, early adopters, early majority, late majority, and laggards. Innovators adopt new innovations right away, are risk takers, and make up 2.5% of the population. Laggards make up 16% of the population and are the last to adopt an innovation. They adopt new innovations only under duress. Approximately 13.5% of the population are early adopters. Once its usefulness has been shown, they quickly adopt the new innovation. Around 34% of the population are early majority adopters and another 34% are late majority adopters.

In addition to individual decision making and innovation diffusion theories, motivation theorists also provide insights into individual decision making. The classical "scientific" management theory viewed employees as rational economic decision makers driven by a desire to earn the most money possible (Taylor, 1947). This view suggests that extrinsic rewards might cause an employee to adopt a new technology. Maslow and Herzberg offer additional factors which might influence individuals to adopt new technologies and/or to take on extra work. In 1954 Maslow offered his human "needs hierarchy." He held that human beings have universal needs (i.e., physical, security, social, self-esteem, and self-actualization) arranged in a hierarchy. Herzberg (1959) theorized that human beings needed their "hygiene" needs (i.e., company policy and administration, interpersonal relations, supervision, salary, and working conditions) adequately met before they would work at all. He argued that employees were only motivated to work productively by "motivator factors" (i.e., achievement, recognition, work itself, responsibility, advancement).

McGregor and McClelland also emphasized the part need satisfaction plays in worker behavior. In 1960 McGregor offered Theory Y which stressed people's need for achievement and satisfaction from a job done well. McClelland (1967, 1975) accentuated the importance of achievement, power and affiliation needs as motivators. Other authors have emphasized how felt needs vary with respect to career stage and the availability of need satisfiers. For example, White (1973) found the managers most likely to be motivated by security and social needs to be those who had reached a peak in their careers, and for whom some of the other motivators were no longer available. Job interest was a motivator for people who had interesting jobs, variety and challenge were motivators for those with challenging jobs. In 1986, Thorpe looked at 63 organizations in depth and found support for the "Reactance Theory." Reactance Theory holds that people need to feel they have some control and freedom in their work. They are not passive receivers of motivational stimuli, but act in ways to secure control, freedom, and improved chances of obtaining rewards (Bowey, 1997).

In 1964, Vroom offered his Expectancy Theory. He stressed the importance of employees believing that they can improve their effort, that this increased effort will lead to improved performance, and that improved performance will be recognized and lead to a desired reward. However, Wannus, Keon and Latack (1983) showed that workers do not usually go through an elaborate process of information processing and rational decision-making. Rather they base their actions on habit, on expectations derived from previous experience and on advice from respected co-workers.

Research Questions

For the purpose of this study, three research questions were posed. They included:

1. To what degree do selected motivator variables influence instructors to teach courses on-line?
2. Is there a significant difference in the degree to which selected motivator variables motivate instructors to teach courses on-line?
3. Is there a significant difference in selected motivator variables with respect to age, gender, subject matter taught, knowledge of computers, knowledge of the World-Wide-Web, prior experience with on-line courses, size of organization, and geographical location?

Methodology:

A web search was undertaken to locate the universal resource locators of on-line faculty and staff e-mail directories for colleges listed in Peterson's 1997 Guide to Two Year Colleges. Thirty-eight colleges were randomly selected to serve as the sample group. A combined cover letter and 31-item questionnaire was electronically mailed to faculty in the selected colleges. Respondents were also given instructions on how to return the questionnaire. Options included e-mail, fax, or the U.S. postal service. Fax and U.S. mail return options were offered to respondents desiring complete anonymity. Items on the questionnaire related to personal/occupational information, perceived knowledge of computers and the Internet, past experience with on-line courses, and motivators for teaching courses on-line.

Data from the questionnaires was entered into a statistical database from which descriptive and comparative statistics were generated. Descriptive statistics included frequency counts, percentages, and means scores for the various variables. Comparative statistics included the results of Chi square, Anova, and follow-up t. tests A series of Chi square tests were performed to test for significant differences in motivators with respect to gender, subject matter taught, geographical location, and prior experience with on-line courses. Anova tests were used to test for significant differences in motivators with respect to age, knowledge of computers, knowledge of the Internet/World-Wide-Web, and size of employing organization. The probability level for determining statistical significance was $p = .05$.

Results

Of the 609 surveys electronically delivered to instructors at 38 community colleges, 405 were returned (66.67% return rate). Three hundred fifty-nine surveys (88.64%) were returned by e-mail, 33 (8.15%) by U.S. postal service, and 13 (3.20%) by fax. Respondents had a mean age of 45.53 years. One hundred ninety-seven (48.76%) were female and 207 (51.24%) were male. Thirty-one (7.65%) of the respondents had taken a course on-line and 14 (3.55%) had prior experience teaching courses over the Internet.

With respect to question one (i.e., To what degree do selected motivator variables influence instructors to teach courses on-line?), several factors were found to have a motivating influence on instructors. The strongest motivators were make courses more accessible to students, being extrinsically rewarded with more money, equipment, released time etc., and challenge (see Table 1). The variable with the least motivating influence was ordered to teach a course on-line.

As to question two (i.e., Is there a significant difference in the degree to which selected motivator variables motivate instructors to teach courses on-line?), a one factor anova test revealed significant differences among the variables in terms of their motivating influence (DF = 405, Sum Squares = 1517.796, F Score = 1.794, P = .0001). Follow-up t tests showed that making courses more accessible to students, receiving extrinsic rewards such as more money, equipment, released time etc., the challenge of teaching a course on-line, interest in computers, and being ordered to teach a course on-line significantly differed from one another as well as the other five motivators (See Table 2).

Regarding question three (i.e., Is there a significant difference in selected motivator variables with respect to age, gender, subject matter taught, knowledge of computers, knowledge of the World-Wide-Web, prior experience with on-line courses, size of organization, and geographical location?), a series of One factor Chi square tests revealed significant differences in the selected motivators with respect to computer knowledge and knowledge of the Internet/World-Wide-Web (see Table 3 and Table 4). Follow-up t test revealed differences with respect to making courses more accessible to students, the challenge of teaching a course on line, interest in computers, chance of being promoted, chance of being recognized, in order to keep job, to go along with the crowd, and if ordered (see Table 5 and Table 6).

Table 1. Mean Rating For Motivators For Teaching A Course On-line N=405

Variables	Mean	SD
Make courses more accessible to students	3.978	1.133
Extrinsic rewarded with more money, equipment, released time etc.	3.681	1.361
Challenge	3.36	1.367
Personal interest in computers and technology	3.188	1.386
Increase chances of being promoted/tenured	2.365	1.411
Public recognition from superiors	2.272	1.233
Necessary to keep job	2.156	1.457
Expanded formal job responsibilities	2.084	1.208
If everyone else was doing it	2.042	1.221
Ordered to teach a course on line	1.884	1.336

*Interest computers	4	125.259	19.27	.0001
*Promoted	4	21.727	2.756	.0277
*Recognition	4	21.275	3.584	.0069
*Keep job	4	22.98	2.762	.0275
Expand job	4	6.948	1.177	.3206
*Go along everyone	4	23.268	3.961	.0037
*Ordered	4	40.243	5.793	.0002

*Significant difference at .95%

Differences among the motivators were also found with respect to age (DF = 4, Sum Squares = 19.497 F = 2.677, P = .0316). Instructors under 30 years of age rated extrinsic rewards a significantly greater motivator than did instructors in their 40s', 50's, and 60's. The same was true for instructors in their 30's compared to individuals in their 60's. Chi square tests showed significant differences in the motivators challenge, interest in computers, making courses more accessible to students and having taken a course on-line (DF = 4, Total Chi Square = 10.252, P = .0364; DF = 4, Total Chi Square = 13.054 P = .011; DF = 4, Total Chi Square = 11.794, P = .0189 respectively). Chi square tests also showed significant differences in the influencing power of selected motivators with respect to having previously taught courses on-line and challenge, interest in computers, and making courses more accessible to students (DF = 4, Total Chi Square = 20.211, P = .0005: DF = 4, Total Chi Square = 20.78, P = .0004: DF = 4, Total Chi Square = 12.341, P = .015 respectively). Instructors with prior experience with taking and teaching courses on-line tended to be more highly motivated by the challenge of teaching courses on-line, their interest in computers, and making courses more accessible to students than instructors with no prior experience with on-line courses.

Conclusions

Several conclusions may be drawn from the results of the study. It appears that some of the selected motivators (i.e., making courses more accessible to students, receiving extrinsic rewards, the challenge of teaching a course on-line, and personal interest in computers) may have potential to influence some instructors to teach courses over the Internet. On a 5-point scale each of the motivators had a mean score of 3.188 or above. One might also conclude that ordering an instructor to teach a course on-line would have limited motivating value. On a 5-point scale being ordered to teach a course on-line had a mean motivating rating of 1.884.

Another conclusion derived from the study is that particular motivators (i.e., making courses more accessible to students, receiving extrinsic rewards, the challenge of teaching a course on-line, interest in computers, and being ordered to teach a course on-line) differ significantly from one another and other motivators in their ability to influence instructors to teach courses over the Web. Conversely, certain motivators were very similar in their ability to motivate instructors. Such was the case with improve chance for being promoted and public recognition from supervisor; expanding job and going along with the crowd; and keeping job and public recognition, expanding job, and joining the crowd.

Finally, it can be concluded that the influencing strength of selected motivators varied with respect to particular personal/occupational circumstances. For example, the strength of selected motivators varied with respect to the age of the instructor, their knowledge of computers and the World-Wide-Web, and their prior experience with on-line courses. The motivating strength of challenge of teaching a course on-line, chances of being promoted, public recognition by supervisor, interest in computers, and making courses more accessible to students, tended to increase with instructors' knowledge of computers. Likewise, the challenge of teaching a course on-line, increased chances for promotion, public recognition by supervisor, interest in computers, making courses more accessible to students tended to be stronger for instructors with more Internet knowledge than their colleagues. The motivating value of join the crowd was the greatest for instructors perceiving their computer knowledge to be similar to their colleagues. Ordered to teach a course on-line and to keep job had the greatest motivating value for instructors with computer and Internet knowledge "less" than their colleagues. Extrinsic rewards tended to be a greater motivator for younger versus older instructors. The challenge of teaching a course on-line, interest in computers, and making courses more accessible to students tended be stronger motivators for instructors who had taken or taught courses on-line.

Discussion

The findings of this investigation hold implications for community college administrators attempting to influence their instructors to offer courses on-line. Demonstrating to some instructors how offering their course(s) on-line will make the course(s) more accessible to learners, or telling how it will result in tangible rewards for themselves (e.g., extra money, equipment, or released time), or showing them how it will mentally stimulate them may help to persuade them to offer courses on-line. Such efforts are likely to be most effective with individuals who already have an interest in computers, are knowledge about the Internet/World-Wide-Web, are 30 years of age or younger, and have some prior experience with on-line courses.

It is possible that many instructors see increasing the accessibility of community college courses as a legitimate use of the World-Wide-Web. Some instructors may recognize the extra time and work involved in teaching a course on-line (Kirk and Shoemaker, 1997) and thus expect to be either extrinsically (e.g., pay, equipment, released time) and intrinsically rewarded (e.g.,, mentally challenged). It is suspected that the mix and nature of the expected benefits may differ with respect of an instructor's age and work situation.

Because many of the motivators had significantly greater motivating value for instructors who were interested in technology and saw themselves as being more knowledgeable about technology than their colleagues, community colleges may wish to consider a number of actions. They may first want to identify and get instructors with the greatest interest and knowledge of web-based-instruction to offer their initial on-line courses. They may also want to consider providing instructors more technology training. Part of such training could include having instructors themselves take a course on-line.

This research generally supports other research findings showing motivation varies between individuals and groups (Legge & Millward (1968); White (1973); and Blackburn and Mann (1979). Individuals significantly differed in the degree to which they claimed to be influenced by selected motivators with respect to age and other personal/occupational differences. The results are also consistent with Reactance Theory (i.e., the belief that people need to feel they have some control and freedom in their work situation). Of the 10 motivators studied, being ordered to teach a course on-line had the smallest motivating value.

Additional research studies seeking to determine the degree various motivators actually influence instructors to offer their courses on-line are needed. While instructors in the study indicated the extent to which selected motivators would influence them to teach a course on-line, it did not measure the actual degree instructors were influenced by the selected variables. Future studies might also look at the influencing strength of potential motivator variables not examined in this investigation. Other potential motivators mentioned by respondents included being able to work at home, more flexible hours, reduction in work load, being able to team teach, assistance in learning technology, technical support, and improved audio/video capabilities.

Towards a Meaningful HRD Function in the Post-Command Economies of Central and Eastern Europe

Devi Jankowicz
University of Teesside, U.K.

Development of the HRD function in the post-command economies of central Europe may benefit the western agents involved in this cross-cultural collaboration as much as the client companies who utilise western expertise. An examination of the existing knowledge-base among managers whom we seek to train as HRD practitioners suggests that our efforts may be constrained by concepts of knowledge transfer, and resistance to change, which are flawed. I suggest some alternative perspectives.

Keywords: Central & Eastern Europe, Resistance to Change, Knowledge Transfer

Human Resource Development is one of several functions which is regarded as underdeveloped, if not absent, among the organizations of central and eastern Europe, as noted by a variety of commentators both before the changes which took place in 1989 (see e.g. Lane 1985; Obloj 1986) and after (Eberwein & Tholen 1997; Jankowicz 1991; Kozminski 1996). Accordingly, the extensive efforts of the last ten years to transfer knowledge and expertise into the post-command economies have generally included material on the purpose, rationale, procedures and techniques associated with the development of human resources, whether conceptualised as "training" or as "HRD", and attempts to aid and/or inform efforts to reshape individual organisations have included a consideration of the content and structural implications at both individual (Lee 1996), organisational (Strzyzewska Kaminska & Wawrzyniak 1996), and institutional (Aguilar 1996), level.

This is a complicated endeavour. There are obvious constraints on outcomes; to take just one example, as when western joint venture partners retain control over human resourcing policy so that the indigenous partner's involvement is limited to simple personnel administration and training provision (Kozminski 1993). In such circumstances, indigenous staff in the joint venture company have little opportunity to contribute to either function at the strategic level, and little exposure to contemporary ideas about organisational and staff development in the wider sense- no HRM or HRD is possible– so that the knowledge that is transferred from the market economy to the post-command economy, may be partial and limited after even the best designed programme.

However, my intention in examining the constraints involved is to focus less on outcomes, and more on the process of transfer itself. My objective is to examine our definitions of knowledge transfer, and the way we construe success in that endeavour, with particular reference to the concept of 'resistance to change'. I believe that a number of untenable assumptions are typically involved, and that there is little point in worrying about difficulties at the outcome level until we have developed more appropriate understandings of the process itself.

The Process of Knowledge Transfer: Two Models

There are two alternative ways of thinking about the process involved.

Export Sales

The simplest approach to knowledge transfer is to view it as *technology* transfer; as a process in which the donor and the recipient share the same conceptual background and assumptions, so that the goods or services to be transferred can be put to use by the recipient after appropriate instructions have been clearly conveyed. Knowledge is seen as a *commodity*: something which comes in discrete units, something to be transported, plugged in and utilised. If the transfer occurs across linguistic boundaries, then the instructions have to be translated with professional competence, as if we were selling a piece of machinery and had to stick foreign-language labels on the controls while remembering to include a well-translated instruction manual as part of the package being despatched.

The metaphor is one of 'export sales': the recipient stands in the role of consumer and is persuaded that s/he needs the product, the donor in the role of producer or salesperson; and both parties are seen as sharing common assumptions about the nature and form of the transaction involved.

New Product Development

A rather less crude approach is to see knowledge transfer as a process of *information* transfer, a process by which the donor removes uncertainty in the recipient. Knowledge is seen as an *abstraction*: concepts, ideas, principles, guidelines, theories, and other immaterial entities. If the transfer occurs across linguistic boundaries, then, again, the material has to be translated, and this is seen as unproblematic: it is assumed that each of the two languages encode phenomena in the same way, so that the abstractions expressed in the language used by the transmitter can be reproduced identically by the receiver. Misunderstandings by the receiver are regarded as a form of noise during transmission: "inaccurate translations", or simple misunderstandings between the transmitter and the receiver, resolvable by a repetition of the information "in other words" within the same encoding system.

However, this sort of account is tendentiously over-simplified. A more complex version of the information transfer process is required, in which it is recognised that different natural languages encode phenomena differently: they are in themselves distinct coding systems. Every language teacher is aware of the importance of idiom in conveying meaning- in fact, such linguistic differences in the way in which phenomena are represented run very deep. The professionalism of the interpreter stems from his or her ability to resolve inconsistencies in mapping the meaning encoded in one language onto the meanings that it is possible to encode in another: Millman & Randlesome (1993); Gilbert (in press); Limaye & Victor (1995). Because they determine the very boundaries of the events which different observers perceive in the phenomenal flow, the different grammars, metaphors, idioms and etymologies of different natural languages slice up reality differently (Jankowicz, 1996)– two perceivers using different languages actually experience different events– and, as Czarniawska (1997: 480) puts it in presenting Latour's account of the kind of translation which this mapping requires (Latour 1986), 'the dictionary itself becomes translated': i.e., the meanings differ, depending on the code-book being used to represent a particular encoding.

Even the basic vocabularies of two languages encodes meanings differently. For example, the word 'manager' is capable of expressing a great variety of meanings in English, while the nearest Slavonic terms convey only the more directive and controlling shades of meaning, for a variety of cultural and historical reasons (Jankowicz, 1994; Vlachoutsicos, 1990; Vlachoutsicos & Lawrence, 1990); Significantly, the Polish word for 'training' includes vocational and instructional phenomena in its encoding, but does not readily encode the management and organisational development shades of meaning. Events during the period of the Polish command economy made the notion of 'personal career development', a neutral enough phrase in the English language, extremely problematic, the concept being tainted by a history of self-promotion within the Communist Party career structure at the expense of one's co-workers and the translation of this phrase into Polish encodes an entirely different reality to the one encoded by the original English phrase.

It follows that, in understanding the same experienced phenomenon by means of two different languages, the meaning encoded by one party may be subtly different to the reality encoded by the other. When they interact in transferring knowledge about that phenomenon, the transfer will necessarily involve the collaborative creation of a new, mutually comprehensible meaning, rather than a simple directional "movement of information" between a transmitter and a receiver, as the simple form of the information transfer model suggests.

The metaphor involved is one of 'new product development', rather than 'export sales': the status of the two parties is no longer that of donor and recipient, but of potentially co-equal collaborators; and they interact in developing something new from the material which each contributes. The result might indeed be that the indigenous party gains information, in the sense of having uncertainty reduced; but, equally, the knowledge of the change agent is similarly open to amendment as a result of the dialectic in which both have engaged. As a business practitioner, (McNeill, 1991) has emphasised, misunderstandings by the indigenous party are not a simple matter of unsuccessful transmission, but of unsuccessful knowledge creation. He advocates the use of two interpreters, the task of the second (who must necessarily be informed of the purposes of both parties, not simply of their utterances) being to comment on the success, or otherwise, of the language translation, and the overall dialogue, of all of the parties involved in the attempt at knowledge transfer.

Resistance to Change

If we are to acknowledge cultural differences appropriately and take cross-cultural collaboration seriously, it follows that we need to use the second metaphor rather than the first. The effectiveness of our attempts to transfer knowledge about HRD hinges on our understanding of the process involved, on the sophistication with which we address the difficulties in mutual knowledge creation which we encounter and, in particular, on the way in which we use the concept of 'resistance to change'. If we accept that cross-cultural knowledge transfer is indeed a dialectic in which meanings must be collaboratively created, then the terms of the dialogue are worth examining.

There is clearly an issue of power to be considered. In the 'export sales' metaphor, though the issue of power differentials is, in principle, an open one, in practice the relationship between donor and consumer is frequently resolved to the consumer's disadvantage, as Bourdieu has pointed out:

> 'Misunderstandings, borrowings removed from their context and reinterpreted, admiring initiation and disdainful aloofness– these are all signs familiar to specialists on the situations that arise when cultures meetÉ any action for the handing on of a culture necessarily implies an affirmation of the value of the culture imparted (and, correlatively, an implicit or explicit depreciation of other possible cultures).' Bourdieu (1971: 198).

In the 'new product development' metaphor, however, the potential equality of both parties is frequently prejudged: the change agent is legitimised as the party which has the 'correct' or 'appropriate' knowledge, and the indigenous party as the one whose uncertainty is to be resolved by the information involved. Thus, for example, Holden & Cooper (1994: 516) quote Aslund & Layard (1993) as accusing Russian managers of an extraordinary contempt for trade and business, coupled with a hubristic belief in their own business expertise, and a palpable ignorance of other countries; while perpetuating the problem themselves, by seeing it as one of language *deficiency* with respect to western experience, (Holden and Cooper 1994: 515), rather than as a matter of differences in what the two languages, English and Russian, are each capable of encoding in a form that would make for unproblematic translation.

Bourdieu is clear that he means 'depreciation', and not *'deprecation'*: his suggestion is that there is a mechanism operating, irrespective of the goodwill or intentions of the individual change agent, which has the effect of devaluing the currency of discourse between the two parties concerned. We can gain a better understanding of this mechanism involved when we examine the concept of 'resistance to change'.

Any basic text will provide an example; here, the popular undergraduate O.B. text, Hellriegel et al. (1995), instances the kind of presentation on which the western manager involved in a joint venture with a central European partner is likely to base his or her thinking about how knowledge can be transferred. The model expresses 'resistance to change' in terms of factors which are, in certain respects, biased. To take just three examples from the list shown in Table 1.

It is assumed that it is the change agent's perceptions that are necessarily accurate, and these are contrasted with the 'defensive' perceptions of the indigenous party: yet, when we examine the notion of perceptual defence outside of the psychology-laboratory context in which the defence mechanism has been researched, we find that the notion of a 'defensive' reaction is a construct which the change agent uses, not the indigenous party: an attribution of behavioural causes which may be professionally made, but which is in principle dependent on the perspective, motives, and intentions of the change agent as much as on the motivational state of the indigenous party. To speak of 'error' in the absence of independent data to that effect is an absurd oversimplification.

The personality factors implicated in 'resistance' are described in terms of the negative poles of the traits involved-- 'dogmatism', rather than 'dogmatism / liberalism'; 'dependency' rather than 'dependency / self-sufficiency'; 'low self-esteem' rather than 'low self-esteem / high self-esteem'-- in the absence of any empirical evidence that the client's behaviour is, indeed, predicated on the negative rather than the positive poles of the traits under consideration. The habits which contribute to 'resistance' are presented in terms of inadequate coping, or of an inappropriate attachment to comfort and security, rather than in terms of the deployment of available coping skills and the wish, present in every manager, to be able to forecast outcomes in conditions of uncertainty. Threats to power and influence are, similarly, discussed in terms which place the indigenous party at an automatic disadvantage: one could as easily justify 'resistance' by examining the extent to which the indigenous party feels the changes being advocated would leave him/her with insufficient authority to cope with increased responsibility. And so on, for all but the last three, 'organisational' factors which Hellriegel instances.

At one level, these factors are clearly important in understanding the variables and issues which must be understood if change interventions are to be appropriately designed, and they form an important part of any organisational diagnosis which a putative change agent would wish to conduct. At another, however, they are deeply value-laden and, although in some instances, (as for example in discussing the 'Perceptions' factor), Hellriegel cautions the reader against over-emphasising the importance of the factor (Hellriegel, et al. 1995: 662-663), by and large the examples quoted do not examine the reasons for 'resistance' from the point of view of the indigenous party.

Construing Differences for Effective Knowledge Transfer

It is indeed difficult to give the sheer difference of a different language its due, steeped as one is in one's own mother tongue! However, the constructivist authors such as Kelly (1991) and Rorty (1982), who acknowledge the existence of a 'real' phenomenal flow but insist that its reality is socially negotiated, provide us with the conceptual resources to handle such differences, so that we can move from a simple understanding of knowledge transfer as information transfer, to the more complex version which draws on what I have characterised by the 'new product development' metaphor. Kelly's notion of the personal construct, by which an individual ascribes meanings to phenomena, and his conceptualisation of the *Sociality process*, by which the individual can engage in role relationships with another only to the extent that s/he is successful in understanding and using the *other* person's constructs, while monitoring and understanding the differences in encoding which this reveals with respect to his or her own constructs, are particularly helpful in this regard.

Personal constructs are bipolar; in other words, they encode meaning in terms of an assertion-in-contrast-to an

Table 1 : The Terminology of 'Resistance to Change'

Factor	Examples	Alternative Examples
Perceptions	the perceptual error called perceptual defence	cognitive mechanisms
Personality	dogmatism dependency low self-esteem	liberalism - dogmatism self-sufficiency - dependency low self-esteem - high self-esteem
Habit	coping security	coping skills predictability
Threat to Power & Influence	disempowerment loss of control	unbalanced authority/responsibility levels degree of autonomy
Fear of the Unknown	anxiety/insecurity/fear	anticipated challenges to fundamental values
Economic Reasons	threat to economic security	feelings of justice and equity
Organisational Design	rigidity, hierarchy of authority	organisational structure
Organisational Culture	lack of flexibility; rigid socialisation	functionality of 'old' norms and behaviour given continuation of prior reward structures
Resource Limitations	lack of time, capital, skills	-
Fixed Investments	fixed assets, unmotivated or entrenched senior employees	-
Inter-organisational Agreements	contractual obligations	-

opposite. Kelly was not the first to make this crucial statement. (de Saussure 1983) makes it one of his central assumptions in his seminal analysis of language and meaning. The value of a word is:

> not determined merely by that concept or meaning for which it is a token. It must also be assessed against comparable values, by contrast with other words... not by what it contains but by what exists outside of it. de Saussure (1983:114).

And so, for example, one might express the particular meaning which 'HRD' has for one person in terms of 'HRD, in-contrast-to The Training Function'; for another, 'HRD, in-contrast-to OD'. One might examine the meaning which 'HRM' has for one person by speaking of 'HRM, in-contrast-to personnel administration', and for another person, 'HRM, in-contrast-to 'conventional line management responsibilities'. To talk simply of 'HRD' or 'HRM' is to be nonspecific about the exact meaning intended, and if they need to build shared meanings effectively, each party involved had better establish which contrast the other has in mind.

Much can be taken for granted within a single culture (though even here, the importance of 'understanding the other's position' in any situation of negotiation has always been recognised). Cross-culturally, though, the negotiation between two parties which results in knowledge transfer requires special care, to ensure that for every asserted term, the full construct (term-plus-contrast) is explored and identified– simply because different languages,

in encoding experience within different cultures, often use constructs which involve entirely different contrasts (according to Kelly; or different associations in general, according to de Saussure).

Two Perspectives on the Transfer of Knowledge about HRD to the Post-Command Economies

When we engage in teaching market-economic principles to managers of the post-com and economies, our power in the knowledge transfer relationship would appear to stem from our experience i what is arguably a more successful economic system than the one under which the managers whom we seek to influence gained their experience. A wide variety of authors, both western and indigenous, have indicated the reasons for the relative failure of the command economy: an absence of involvement in marketing, distribution, HRM/HRD, financial and strategic management activities at the level of the individual enterprise, together with an underdeveloped knowledge about these practices at any level, corporate or state-institutional (see, for example, Auerbach & Stone, 1991; Kozminski, 1992; 1993; Krysakowska-Budny & Jankowicz 1991; Ullman & Lewis 1996).

In the HRM/HRD field, human resourcing involved the annual negotiation of production targets, together with the maintenance of excess labour capacity to ensure that targets were over-fulfilled when parts and raw materials became available in what was a collapsing supply chain. Production planning systems based on statistically proficient models ignored the social and behavioural aspects of the production process. Since sales, distribution and marketing were not the responsibility of the individual organisation, only the production targets mattered, regardless of the escalating real costs involved; in the absence of competitive pressures, frequent upwards reporting was the only control mechanism available. In consequence, training was largely confined to technical, reporting, and safety procedures. Kozminski (1992) is one of many authors who have described the behavioural consequences observable in the command, and early post-command, organisations.

These are the kinds of behaviour which our efforts at knowledge transfer are designed to influence, and my main point is that our attempts to alter such behaviour, even when they restrict their scope to the knowledge and skills elements and disregard the motivational and values components, are likely to be a failure unless our efforts to negotiate new meanings with indigenous managers give full value to their constructs: to the explicit, and implicit or contrasting, poles involved. Table 2 summarises some of this behaviour and suggests that, coupled with the counter-productive and negative aspects which are obvious to the western observer, there are a number of contrasting positive aspects which western observers frequently ignore when making training interventions, precisely because they do not give the full constructs– the meanings as conveyed by the terms-and-their-opposites– their full value.

Rather than addressing the financial inefficiencies and motivational dysfunction of labour hoarding, for example, we might recognise the level of sophistication and coping skills developed as a result of such practices within the command economy. The kind of concealment which allows an enterprise to report targets comfortably achieved at 100%, or even "norms overfulfilled" at 120% level, using a previously hoarded 20% to 40% excess of labour resource, demands a high degree of negotiating and planning skill– to organise and amass the excess 20% - 40% of labour in the first place, and to mobilise it when the need arises. Not to mention the well-developed communication skills required to massage the figures when the output was, in reality and commonly so according to Kozminski (1992: 153), appreciably short of the figures reported. The clear evidence that such practices led to a lowering of standards and a habituated tolerance of mediocre results (see Kozminski, 1993 with respect to Poland; Buravoy & Lukacs, 1985 in the case of Hungary; and Artemyev & Turner, 1994 in the case of Russia), and the distaste which one might feel for the venality involved, should not detract us from recognising the level of skilled performance required.

While recognising the inadequacies of a purely Taylorist approach to production planning and control, and the motivational consequences with respect to the human resource, it is important to acknowledge the value of technical rationality and the skills involved. In valuing the development of supervisory and management practices which adopt a rational/calculative approach in situations of uncertainty (e.g. Copetas, 1993, Aslund and Layard, 1993, Eberwein and Tholen, 1997), it is also important to recognise the centrality of intuition and subjective judgement, especially in the more strategic management activities at Board level (see, for example, Garratt, 1987; Hisrich & Jankowicz, 1990; Isenberg, 1984; Kelly & Gennard, 1996), and acknowledge the likelihood that these particular intuitive skills were well developed among the managers during the command economy.

Equivalent comments can be made with respect of each item in Table 2; the point being that we are likely to be more effective in the ways in which we negotiate meanings with indigenous managers if we recognise what they are able to do well, as well as what they did badly, and this becomes easier when we predicate such recognition on an underlying skill. Handling the knowledge transfer activity means recognising the ways they construe their own behaviour- as Kelly's Sociality process suggests- collaborative management development then becomes a matter of

working with the skill, which can be positively or negatively, effectively or ineffectively deployed, rather than a matter of eliminating dysfunctional behaviour.

Perhaps the most valuable skill learnt by the manager in the command economy was a very high degree of conceptual sophistication: the realisation that there are many ways to handle an absurd system, coupled with a recognition that personal advancement depends on being able to communicate with colleagues in a network what is really required when their help is sought, even when the official system of the command economy makes it unwise to spell the details out explicitly. Writing during the early, Stalinist period, Milosz (1981) challenges simple-minded, western interpretations of behaviour in the command economy as follows:

> 'Writers of the peoples' democracies make use of an accepted style, terminology, and linguistic ritual. What is important is not what someone said but what he wanted to say, disguising his thought by removing a comma, inserting an 'and'... Unless one has lived there one cannot know how many titanic battles are being fought... a Pole, Czech, or Hungarian practised in the art of dissimulation smiles when he learns that someone in the emigration has called him a traitor... at the very moment when this traitor... is

Table 2 : The Behaviour of the Manager in the Command Economy, together with some Necessary Skills

Explicit Pole : Negative Aspect	Contrasting Pole :Positive Aspect	General Skill
concealing labour and material resources "massaging" production and financial reports	sophistication in annual budget negotiations where virement between headings is tolerated *probably none*	Focused coping skills
flight into inappropriate level of technical detail; neglect of social factors; irrelevant, expensive consultancy reports	decisions informed by technical rationality; efficient standard operating procedures	(Taylorist) Rationality
inaccuracy in situations of uncertainty avoidance of systematic monitoring & evaluation	sensitivity to situational factors drawing on extensive prior expertise and experience ability to justify "the big picture"	Intuitive skills
venality, corruption and bribery: "you scratch my back, I'll scratch yours"	ability to access helpful power-holders, in the knowledge that the relationship is mutually obligatory	Networking skills
illness, esp. psychosomatic inaction due to excess role ambiguity	tolerance, stamina and endurance tolerance of ambiguity	Stress-handling
sophistry and dissimulation, cynical "spin-doctoring"	openness to nuance in verbal and written expression; openness and willingness to reconstrue	Conceptual sophistication

> engaged in a match of philosophical chess on whose outcome the fate of fifteen laboratories or twenty ateliers depends.' Milosz (1981: 78-79).

When communication must be conducted at several levels, *disguising* a thought in order to communicate it more effectively represents a highly sophisticated level of skill: a skill practised very widely indeed, if one accepts the assertions outlined in Czarniawska (1986). The 'struggle for meaning', during which the Solidarity opposition and the state authorities vied to publicise their disparate interpretations of phrases which summarised differing values pertaining to common referent concepts was not simply a characteristic of the organisational culture of the 1980s, when the extent of the systemic change was being negotiated, but typified general culture during the command economy. This skill is likely to remain available, at least among the middle-aged and older management practitioners, in the post-command period. To teach a person like this negotiation skills, for example, by running the 'Prisoner's Dilemma' exercise, (and I have seen it done!), is to invite challenges, based on substantial mathematical/technical knowledge, to the over-simplicity of the payoff matrix on which this exercise depends, while ignoring the availability of substantial expertise in effective negotiation among the participants themselves.

In Conclusion: Bringing some Inferences Home

It should be pointed out that this argument ignores the importance of social norms and personal values in knowledge transfer, and focuses on the admittedly simpler issues which arise when knowledge and skills are being 'transferred'. As Arbnor & Bjerke (1997) have remarked, the problems which arise when we seek to reconcile different viewpoints stem primarily from incompatibilities in personal epistemologies- beliefs about what constitutes worthwhile knowledge and how to recognise when this has been mutually created, rather from contending subject-matter content (knowledge) or how such knowledge is deployed (skills). Nevertheless, if we confine discussion to these simpler matters, perhaps the lessons for our own debates over knowledge transfer and resistance to change, here in the US and UK and across the rather more permeable boundaries which separate us, may be more clearly discerned.

Firstly, the idea that 'transfer' is a misnomer, and 'mutual creation' based on the negotiation of new understandings is a more accurate description, suggests the importance of involving the trainees, with their existing personal conceptual systems, in designing teaching strategies. If teaching strategy differs from learning strategy in incorporating a model of the transfer process as well as a description of what each party, change agent and learner, must do for learning to occur, then that model should be open to negotiation and mutual development. I am not sure to what extent our existing prescriptions for collaborative learning, in which we seek to develop 'a learning community in the classroom' (Novak 1990), allow for such involvement: at best, the approach and subject-matter to be taught are negotiated, with client involvement, at the initial contracting stage when the course in question is first mooted, but the participants themselves are rarely included in such discussions, nor are the discussions seen as an integral part of the learning process itself. Revan's Action Learning (Revans 1982; 1983), with its role of set facilitator as a co-equal with the members of the learning set, comes nearest to the collaborative involvement I have in mind.

Secondly, the idea that the learner can have very good reasons for engaging in behaviour one might otherwise call 'resistance to change' suggests that what change agents must do is *understand*, rather than 'overcome' it. This understanding can only occur when change agents work from the learner's perspective rather than their own and, to do so, the learner needs opportunities to define his or her own terms in negotiation with the change agent, since the constructs a person typically uses (the assertions-and-contrasts in which his or her meanings are expressed) are rarely self-evident.

It could be argued that much of our western work in organisational training (especially in O.D. in the Beckhard (1967) and Harrison (1970) experiential tradition), does just this. However, interventions of these kinds are characteristic of activities in which a measure of personal development is concerned: in which changes of attitude and values are involved. I am arguing that any learning situation, even when the objectives are confined to relatively simple changes in knowledge, skills and procedures, requires just this sort of analysis if enduring behavioural changes are intended. An alternative way of saying this could be that any intervention in which behavioural changes are to be enduring involves inseparable attitudinal and value components, and that we tend to ignore these: the rich literature on job analysis for training purposes, and on intervention design, rarely addresses the construing of the intended participants themselves, though there are a few exceptions, e.g. Jankowicz (1990); Smith (1980); Stewart & Stewart (1982), to be found.

The Impact of Human Resource Development on the Winter War Between Finland and the Soviet Union, 1939-1940

John A. Niemi
Ville Nurmi
Northern Illinois University

This study examines human resource development (HRD) activities that impacted the performance of the Finnish army in the 1939-40 Winter War with the Soviet Union. The analysis of those activities is based on a model that accounts for the various HRD elements, as well as for outside forces that affected the conduct of the war.

Keywords: Finland, Soviet Union

The Winter War between Finland and the Soviet Union took place nearly a half century ago, yet the valor and ingenuity of the Finns continue to amaze the world. This war had its genesis in the non-aggression pact between Stalin and Hitler in August, 1939, that allocated Estonia, Latvia, Lithuania, and Finland to the Soviet sphere of influence. Many attempts were made by the Soviet Union to negotiate the exchange of underdeveloped land in Soviet Karelia for Finnish land that lay a mere 32 kilometres from Leningrad. Unlike the Baltic states, Finland resisted these territorial demands. In frustration, Soviet Foreign Minister Molotov said, "We civilians can't seem to do any more. Now it seems up to the military. It is their turn to speak" (Engle and Paananen, 1973, p. 12). At that time, the German blitzkrieg that had quickly shattered Polish resistance was foremost in the minds of Soviet commissars, who envisaged mounting a similar offensive against Finland. Soviet Commissar Kulik stated sternly to Marshal Voroniv, "You are ordered to base all your estimates on the assumption that the operation will last twelve days" (Voronov, 1963, pp. 136-37). Actually, the Winter War lasted 105 days and featured some of the toughest military campaigns ever waged between a small nation, Finland with a population of less than four million, and the Soviet Union, with a population of 168 million. Similarly, Finland's regular army of almost 30,000, supplemented by trained reserves of nearly 281,000, was vastly outnumbered by a Soviet army of 3 million, supplemented by trained reserves of 16.5 million. When a peace treaty was finally signed on March 13, 1940, the astonishing fact emerged that Finnish losses totalled 25,000 dead and 55,000 wounded, compared with Soviet losses estimated by Finns at "175,000-200,000 dead and 300,000 wounded" (Chew, 1971, p. 212). The reason underlying this discrepancy will become evident later in this paper.

Although the valiant efforts of the undermanned Finnish army has been studied extensively, little attention has been paid to the human resource development (HRD) and organizational ideology efforts that laid the groundwork for Finland's performance in the Winter War. The factors that impacted these efforts are set forth in a model that appears as Figure 1. An important political issue was the Soviet desire, mentioned earlier, for a buffer zone, to be appropriated from Finnish territory, for the defense of Leningrad. Another political issue was the Finnish desire to remain an independent nation, instead of becoming a Soviet state. As for financial issues, the Finns had not allocated sufficient resources for weaponry, because they had not anticipated this challenge to their frontier. The size of the country was an important factor, because it made possible the rapid mobilization and deployment of defense forces.

Figure 1: Factors effecting on the results of the war.

[1]the definition of HRD is by Gilley & al. 1989
[2]the definition of Organizational Ideology is by King, 1994

The second part of the model shows the elements within the military forces that included HRD, organizational ideology, and resources. Other factors, such as weather conditions and geography, played an important role in planning tactics, strategies, and battles, and therefore the results of the war. The HRD aspect of the Finnish army focused primarily on the pre-service training of enlisted men, non-commissioned officers, and officers. The training of these military forces began in 1919 with Finland's independence from Russia. From 1919 to 1939, every healthy male served in the army. Enlisted men served twelve months, and officers served eighteen months. In addition, reservists in various communities, under the leadership of non-commissioned and reserve officers, could attend 40-60 day refresher courses. In many cases, these officers were better leaders than the regular permanent officers because of their field experience with their local reserve units (Halsti, 1955; Laine, 1987). The strength of the Finnish army reserve units was greatly enhanced by the presence of 2,000 officers who had received their initial, rigorous training at Fieldmeister School near Hamburg, Germany, in their youth. As former members of the 27th Royal Prussian Battalion, they served under General Mannerheim in the 1918 Finnish civil war. In 1939, Field Marshal Mannerheim, appreciating their leadership potential, selected appropriate officers from this group for specific roles. These men became experts at waging guerrilla warfare. Special training to surmount the problems of fighting on difficult terrain became an important on-the-job learning experience. Engle and Paananen (1973) gave this account of the Finnish soldier:

> The Finns had been on skis from the time they had been small children. They had lived with and loved their wild country all their lives. Few had travelled more than a few miles from their birthplaces. As youngsters, they had played the game of "suunnistaminen," or orientation in the forest. School children were given a list of checkpoints within the woods where they were to make contact at a stated time. Hidden behind trees, instructors made sure that the young Finns reached their designated checkpoints. These northerners were experts at finding their way in the vast wilderness; their war tactics were based on the simple question, "Why go into an open field and get shot at, when you can have the protection of the forest?" (p. 84).

The Home guard, a voluntary organization comparable to our state National Guard units, sponsored such peacetime activities as rifle and ski competitions. Chen (1971) reported that "an average of 80,000 to 100,000 members participated in its training programs" (p. 27). However, the overall training of the Finnish army in the 1930s concentrated more on service and maintenance of such border defenses as the Mannerheim Line -- the Finnish equivalent of the French Maginot Line – than on weaponry. Fortunately, individual soldiers were well-prepared to live, fight, and survive under severe winter forest conditions, as their civilian work had been closely related to nature on the farms and in the forests. Often their leisure-time pursuits included hunting and skiing, two activities that taught them skills that served them well in the Winter War. The Finnish troops on the northern front were capable of skiing 20 to 30 miles prior to an engagement with Soviet troops and could withstand temperatures as low as 50 below (Halsti, 1955; Lane, 1987). In analyzing the situation prior to that war, Field Marshal Mannerheim noted:

> To a large extent, our defensive struggle commenced under more favorable conditions than we had dared to expect. The nightmare of the General Staff during the past 20 years had been the problem of how weak our covering troops would be to hold the gate to the Karelian Isthmus until the main forces of the field army had occupied the position....During the period of four to six weeks, we had been enabled to complete the training and equipment of troops to make them familiar with the country, to continue to build fortifications, to prepare work destruction, and to lay mines and mine-fields. The homogeneity of units thus become very different from what is usually the case with hastily mobilized troops immediately thrown into battle. These circumstances were calculated to produce confidence before the trials in front of us (Chen, 1971, p. 26).

The remainder of the training was two-fold. Soldiers were encouraged to use their expertise learned as skiers to make wide circles through the wilderness, attacking the Soviets from the sides and the rear, usually under the cover of darkness, storms, or fog. Their expertise gave to those operations the flexibility so necessary to the conduct of guerrilla warfare.

The other aspect of training was on-the-job expertise designed to teach soldiers how to disable Soviet tank columns. This expertise involved crawling to Soviet tanks with TNT charges or climbing the tanks and using Molotov cocktails. These were bottles filled with kerosene, tar, and gasoline. The Finns hurtled these blazing bottles into the open hatches of the first Soviet tank in a column. The disabled tank brought the Soviet convoy to a halt, enabling the Finns to carry out the second strategy called "motti." Motti involved killing enemy crews as they fled from the disabled tank and also the killing infantry troops following this tank. The Finns then attacked the stalled second tank and continued chopping off segments of the column.

As for career development shown in the model, obviously little such development could occur in a short, 105-day war. However, certain leadership qualities emerged during this defensive guerrilla war, and Finnish soldiers who displayed those qualities were rewarded by promotions.

Concerning organizational development, the Finnish army was blessed by the leadership of Field Marshal Mannerheim, who had had wide experience with the Czar's army. He understood the Soviet mind, and he knew the weakness of the Soviet army following Stalin's purge in 1938 of leading professional officers. As a result, Soviet troops came under the command of Soviet commissars, instead of military men, at the beginning of the war. The weakness of the Soviet army not only emboldened the Finns but had a dramatic effect on their performance in battling the Soviet army. Largely because of weak Soviet leadership, the Finns easily destroyed Soviet forces and equipment and amassed a large amount of Soviet weaponry to supplement their own scanty supply.

Organization ideology was defined by King (1994) as commitment, value congruence, and loyalty. The Finnish soldiers' commitment to battle could be summed up by the word "sisu," meaning tenacity of purpose, intestinal fortitude, or simply "guts." The great Finnish Olympic runner, Paavo Nurmi, said, "Sisu makes men do the impossible...it comes miraculously in times of stress (Strode, 1952, p. 410). Value congruence grew out of Finland's fierce desire to remain independent, not to surrender as had the three Baltic states under the pressure of the Soviet advance. The quality of loyalty was greatly strengthened by Stalin's avowed intention to organize a puppet Finnish state after the presumed Soviet victory. This plan infuriated the Finns and caused the Red Finns and White Finns, who had been foes in the civil war, to unite against the common enemy.

The third element within the military forces was resources. The outbreak of the war found Finnish troops out numbered three to one by Soviets troops, 80 to one by tanks, five to one by guns and mortars, and 50 to one by aircraft. The Finns had expected military assistance from Britain, France, Sweden, and the United States, but it was not forthcoming. However, the Finns salvaged quantities of guns, ammunition, and food from defeated Soviet forces. One Finnish army officer commented that the best equipment and ammunition that the Finns had came from the Soviets. As for human resources, the Finns had an enormous advantage in that the enlisted men and officers

knew each other well, because they had lived, worked, and bonded in the same geographic areas in their civilian days. This experience created an esprit de corps that proved invaluable in battle and a talent for small unit tactics so vital to guerrilla warfare.

Other resources included clothing and food. The Finns, accustomed to frigid temperatures, were sensibly clad in layers of clothing under a white covering that provided an effective camouflage amid the snow. The Soviets, anticipating a brief war, wore lightweight olive brown tunics. For the same reason, the Soviets were poorly supplied with food, a situation exacerbated by fierce Finnish tactics that destroyed Soviet field kitchens and further weakened a demoralized enemy.

Other related factors, as shown in the model, were weather conditions. The winter of 1939-40 was the second coldest in history. As a result, a large amount of Soviet motorized equipment froze, making the stalled vehicles excellent targets for the Finnish ski troops. Geographic conditions, such as dense forests, lack of roads, rugged terrain, and innumerable lakes, combined with weather conditions, enabled the Finns to wipe out two major Soviet units.

Despite the valiant efforts of the Finns and, in particular, their single-battle victories, they had to sue for peace when Stalin, embarrassed by Soviet defeats, appointed a regular general to command hundreds of thousands of Soviet troops against the exhausted Finns. Thus ended a noble period in Finnish history.

Designing Effective Training Program for International Transfer

Doo H. Lim
Indiana State University

In an effort to examine the effect of training design on the transfer of HRD training for a global company, a training project for a Korean organization was studied. Applying a conceptual model of international transfer of training, ten case studies were conducted. Data analysis results revealed several reasons of high or low learning and transfer of training. Training design issues for effective transfer were discussed.

Keywords: Training Design, International, Training Transfer

In the age of turbulence and pressures of continuing change, today's organizations are facing severe competition from around the world. In this global environment, organizations are encountering globalization of its employees as well as the business itself. This trend impacts employee training and development to cope with the global needs of employee performance. The change toward a more global orientation for employee training necessitates the need to understand the nature of learning and training transfer between organizations and countries. Despite the critical influence of transfer on the success of a business, many training initiatives of multinational organizations fail to meet the cultural and organizational needs of recipient organizations in multicultural settings (Lim & Wentling, 1998). Designing a global training program that accommodates the cultural and organizational needs becomes a critical task for HRD professionals in today's organizations.

Several theoretical and practical reasons initiated the need for the study. First, numerous empirical transfer of training studies have been conducted in recent years (Baldwin & Ford, 1988; Ford & Weissbein, 1997), but seldom in cross-cultural settings. Moreover, current theories and models of transfer of training were also considered inappropriate to study the nature of learning and transfer of training in cross-cultural environment (Lim & Wentling, 1998). Considering the impact of globalization on training, the need to set up a model for the cross-cultural transfer of training is growing more than ever. Through the model, the factors in training design, organization, and cultural differences affecting the transfer of training can be examined and verified in cross-cultural environment. From a practical point of view, HRD practitioners in multinational companies need guidelines to better understand the transfer of training within a global context. The findings of this kind of study will help program designers within multinational companies develop overseas training programs that better meet organizational and individual needs and are culturally appropriate.

Questions for Investigation

The purpose of this study was to examine the degree of learning and training transfer made by HRD professionals of SK Group in Korea and to identify what factors in training design affect the learning and transfer of training. Following research questions were developed to investigate the purpose of the study:

1. To what extent do trainees perceive their learning has resulted from training?
2. To what extent do trainees perceive their learning has transferred to their jobs?
3. What are the reasons of high or low perceived learning and training transfer?
4. What factors in training design affect trainee's learning and transfer of training to the job?

Theoretical Framework

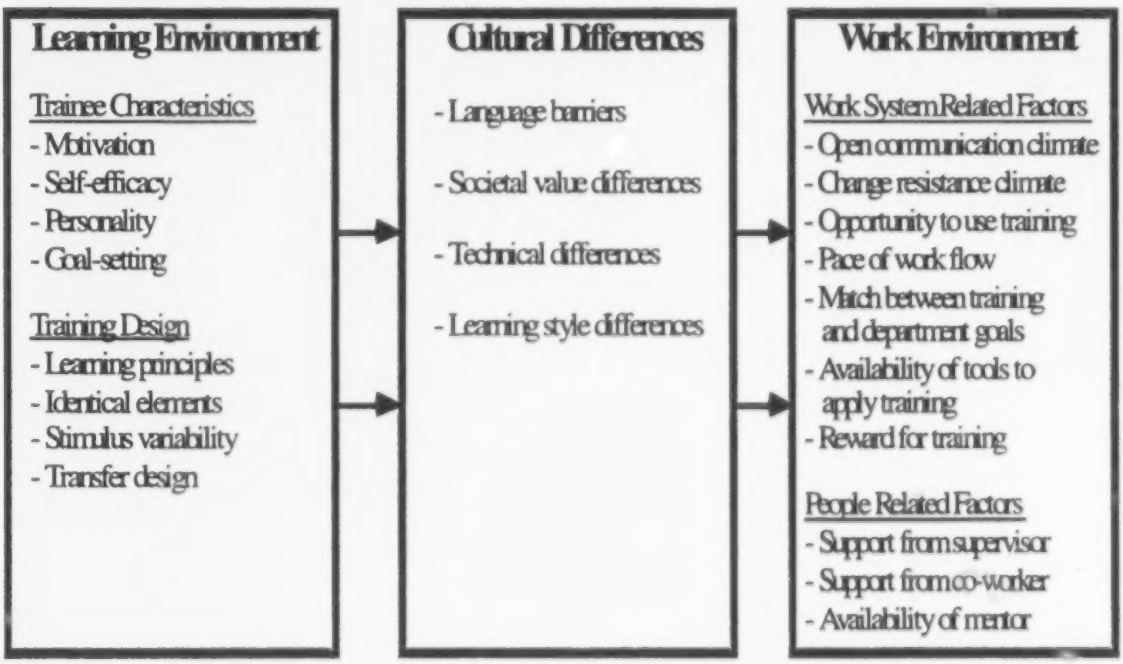
In order to investigate the transfer of training across international settings, a theoretical framework for training transfer was developed. This framework was derived from an extensive literature review on training transfer, which resulted in a model of international training transfer and the identification of critical training design variables that may influence transfer.

Copyright ©1999 Doo H. Lim

A Model of International Transfer of Training

Several researchers have developed theoretical frameworks to investigate the transfer of training domestically and internationally. Based on a careful review of several models of training transfer and international training transfer (Baldwin & Ford, 1988; Geilen, 1996; Huczynski & Lewis, 1980; Lim & Wentling, 1998), common characteristics for a model of international transfer were identified (see Figure 1). First, a model of international training transfer must encompass three primary domains: learning environment, cultural environment, and work environment. Second, the three domains of the model include several sub-elements or variables that can affect transfer of training. Third, the three domains and sub-elements interact with each other by shaping a specific pattern of influence on the transfer process. Fourth, the model of training transfer describes a systematic process that has direct or indirect relationships between the elements of each domain.

Figure 1. A model of international transfer of training.



Among the three domains of the Model of International Transfer of Training, the effect of training design on transfer of training has been studied by numerous researchers because it is believed to be one of the most important constructs impacting training transfer (Brinkerhoff & Gill, 1992). The training design variables can be categorized into two domains: instructional design and instructional method.

For instructional design, Baldwin and Ford (1988) describe three instructional design issues that impact training transfer: identical elements, stimulus variability, and teaching of general principles. According to them, transfer of training is maximized; 1) when there are identical stimulus and response elements in the training and transfer settings; 2) when a variety of relevant training stimuli are employed in the training content; and 3) when trainees are taught the general rules and theoretical principles that underlie the training content.

Many researchers have studied the effect of various types of instructional methods on training transfer. Overlearning, a process of learning far beyond the required level of performance, supports retention of training (Hagman & Rose, 1983). Post-training interventions such as goal setting (Wexley & Nemeroff, 1975) has been shown to increase the motivation of trainees to transfer learned skills to the job. Garavalia (1993) suggests several instructional methods for effective training transfer: (a) use of many different examples in various contexts, (b) use of analogies, (c) use of computer simulation, and (d) use of advance organizers. As an effective way to increase transfer of training, Foxon (1997) advocates the action planning method for training. Finally, tutoring and coaching

are considered powerful tools to polish new behaviors and skills acquired in the training (Huczynski, 1989).

In this study, the researcher applied the framework of the Model of International Transfer of Training to verify the degree of learning, transfer, and reasons of high or low transfer in global context. Among the three domains, this study examined the construct in training design.

Methodology

To explore the transfer of training, a recent training project for a Korean organization, SK Group, was studied. SK Group is one of the largest conglomerates in Korea; ranked as the fifth largest in Korea in terms of sale revenue in 1997. Fifteen companies in various product lines comprise the conglomerate.

In the study, ten individual case studies were planned and conducted. Case study design for data collection and analysis was used because each trainee was expected to have a different pattern of training transfer. The subjects for the study included ten HRD practitioners of SK Group in Korea who attended an HRD training program offered by the Department of Human Resource Education at the University of Illinois at Urbana-Champaign. The ten trainees came from four companies of SK Group and their job titles included HRD specialists, assistant manager, and manager.

A questionnaire was developed to obtain the trainees' perceived degree of learning and training transfer. The questionnaire included question items composed of the seventy training objectives extracted from the instructors' lesson plans that were used during the instruction. The question items used a four point Likert-type scale to measure the degree of the learning and transfer. A structured interview guide was developed to investigate the reasons for high or low learning and transfer and to collect examples of successful transfer. To evaluate the content and construct validity of the instruments, a pilot test was conducted.

Interviews, questionnaires, observations, and document review were utilized to obtain data for this study. Each trainee was asked to participate in two interviews for data collection. The reason for using the two-tiered interview process was because the trainees were expected to refresh their learning from the first interviews and provide more in depth information during the second interviews. The questionnaire was used during the first interview to determine each trainee's degree of learning and training transfer for each of the 70 training objectives. Responses from the questionnaire were used during the second interview to guide questions asking for reasons to explain the high or low learning and training transfer for each training objective. Data collection began six months after the training program ended. The researcher conducted all individual interviews with each subject in Korea.

Two methods were used for data analysis: basic descriptive statistics and qualitative analysis. The units of analysis for the descriptive case studies were: (1) the trainees' perceived degree of learning, (2) their perceived degree of training transfer, and (3) the reasons why learning and the later transfer of their learning to their jobs did or did not occur. The degree of learning and training transfer was first analyzed using basic descriptive statistics. The reasons for high or low perceived learning and training transfer for each training objective were explored and categorized. Document review and observations were conducted to collect data regarding incidents and examples made by the trainees on the job.

The Training Program

SK Training Center, the centralized training center for all employees of SK Group, implemented various overseas training programs to develop the HRD professionals from each company within SK Group. The Performance Improvement Technology Training Program was designed by the University of Illinois to provide SK HRD practitioners with knowledge and skills in the area of computer technologies for training. The training program was conducted for three weeks in August, 1997. The general objectives of the training program were to identify and describe technologies that enhance learning, develop quality instructional materials and evaluate them, and effectively use a variety of technologies for instruction and administrative purposes.

Instructional emphasis in the course was placed on recent developments that involve the use of the Internet and its application in education and training. Instructional technologies such as computer-based instruction, computer-based testing, distance learning, and intelligent instructional technologies were included in the curriculum. Instructional methods used for the training program were lecture, reading, discussion, projects, benchmarking field trips, and computer skill practice. A total of 70 specific learning objectives were developed for the course.

Findings

Degree of Learning

In order to identify what was learned or not learned during the course, the trainees were asked to rate their degree of learning for each of the 70 learning objectives in the course. As a group, the ten trainees indicated a fairly high perceived degree of learning. The population mean score for the perceived degree of learning was 2.0 on a 4 point scale (scale range was 0 to 3), which indicates "mostly understood" in the rating scale of the questionnaire. Further analysis was conducted to examine the degree of perceived learning within different goals of the course. The course learning objectives were categorized into four domains: learning principles and theories (18 objectives), conceptual understanding of performance improvement technologies (30 objectives), specific knowledge to master skills for distance learning technologies (11 objectives), and skills for using distance learning technologies (11 objectives). Table 1 shows the average perceived degree of learning for each category. As shown in Table 1, the trainees perceived greater learning for objectives that addressed skill development and conceptual understanding. Slightly lower learning was perceived for objectives that addressed theories and skill oriented knowledge.

Table 1
Average Perceived Learning Based on Training Objectives

Learning Objective Domains	Number of Objectives	Mean	SD
Learning principles and theories	18	1.90	.66
Conceptual understanding of performance improvement technologies	30	2.06	.70
Specific knowledge to master skills for distance learning technologies	11	1.86	.82
Skills for distance learning technologies	11	2.14	.71
Total	70	2.00	.72

Analysis was also conducted to examine the extent to which the trainees felt that certain objectives promoted either a high or low degree of learning. Sixty-three of the 70 objectives were rated above the midpoint on the 4 point scale (>1.5) while 7 of the objectives were rated below the scale midpoint. On the 4 point scale, 0 indicates "didn't learn" while 4 indicates "completely learn." During the second interviews the trainees were asked to provide reasons why certain objectives had resulted in either a high or low degree of learning. Table 2 contains a list of the factors that contributed to their learning.

Transfer of Learning

An analysis of the degree of transfer was conducted through interviews with the trainees and by reviewing documented evidence of transfer. The trainees seemed to have many chances to transfer what they had learned through the training to their jobs and tasks. The average of the ten trainees' perceived degree of training transfer for the 70 learning objectives was 1.61, which indicates a moderate degree of perceived transfer. The group's perceived degree of transfer was somewhat lower than their perceived degree of learning. Table 3 shows the average perceived degree of transfer for the four categories of learning objectives. It is interesting to note that the trainees felt that they had the greatest transfer of objectives that addressed learning theories and conceptual understanding of performance improvement technologies. This seems counter to the general notion that specific skills are most likely to transfer.

Table 2
Most Common Reasons for High or Low Perceived Learning

Reasons for High Degree of Learning	*f* [a]	% [b]
• Highly related to their job	143	21.9
• Previous understanding or knowledge	141	21.6
• Quality of examples and demonstrations	77	11.8
• Opportunity to apply on the job	65	9.9
Reasons for Low Degree of Learning	***f*** [a]	**%** [b]
• Forgetting due to the time lapse	76	44.4
• Lack of interest in the topic	54	31.6
• Lack of understanding during the training	30	17.6

Note. [a] indicates the number of times this reason was provided for each of the objectives that the trainee indicated had resulted in either a high or low degree of learning. [b] percentage of responses based on 63 high learning objectives and 7 low learning objectives.

Table 3
Average Perceived Transfer Based on Training Objectives

Learning Objective Domains	Number of Objectives	Mean	SD
Learning principles and theories	18	1.71	.89
Conceptual understanding of performance improvement technologies	30	1.67	.95
Specific knowledge to master skills for distance learning technologies	11	1.37	1.01
Skills for distance learning technologies	11	1.52	1.08
Total	70	1.61	.97

Evidence of the transfer of training was found during the first interviews. Five trainees said that began using some of the performance improvement technologies presented during the training when they returned to their jobs. Seven trainees indicated that they intended to apply what they learned from the training to their future jobs and tasks.

Although the trainees felt that transfer of learning had occurred, it was not always an easy transfer. Five trainees said that some of the conceptual objectives from the training were difficult for them to transfer while six

trainees said that some of the skills they had learned during the training were hard to transfer. During the second interviews, the trainees were asked to provide reasons why some of the objectives transferred while others did not. Table 4 provides a summary of the most common reasons why transfer did or did not occur. The primary reasons for high perceived degree of transfer was (1) the opportunity to use their learning on their job (77%), (2) needed for personal use (14%), and (3) used what was learned to persuade others (5%). The trainees provided numerous examples to explain the opportunities they had to use what was learned on their jobs. These examples included (1) for planning and discussion purposes (28%), for program development (14%), for information system design (13%), and for instruction (11%). The most common reasons for low transfer included (1) the lack of opportunity to apply the learning on the job (64%), (2) no direct relationship of the learning with their job (15%), and (3) lack of understanding of the content (9%).

Table 4
Reasons for High or Low Perceived Transfer

Reasons for High Transfer	*f* [a]	% [b]
• Opportunity to use on the job	325	77.4
• Used for personal use	60	14.29
• Used to persuade others	20	4.76
Reasons Low Transfer	***f*** [a]	**%** [b]
• Lack of opportunity to apply on the job	270	64.3
• Not directly related to my job	63	15.0
• Lack of understanding of the content	39	9.3

Note. [a] indicates the number of times this reason was provided for each of the objectives that the trainee indicated had resulted in either a high or low degree of transfer. [b] percentage of responses based on 39 high learning objectives and 31 low learning objectives.

Training Design

In this research study several characteristics of the design of the training program affected the trainees' learning and transfer of training directly or indirectly. From the trainees' comments about the training design, the inhibiting and promoting factors of training design on the learning and training transfer were identified. The number in parenthesis is frequency of response from the trainees. The inhibiting training design factors identified were: inappropriate benchmarking field trips (4), lack of sufficient time to preview the training content (2), lack of thorough needs assessment for each trainee (1), insufficient practice and exercise session (1), mismatch between the practice session and the learning content (1), inappropriate grouping of trainees for workshop activities (1), lack of clarification of technical terminology (1), and insufficient lab hours for computer use (1). The promoting training design factors identified were: instructor's mental and emotional involvement in the instruction (3), instructor's demonstration of teaching principles through the instruction (2), demonstration of specific examples (2), self directed daily wrap up meeting (2), instructor's sensitiveness to cultural differences of the trainees (1), step by step instruction moving from basic to advanced learning content (1), skill practice session (1), teaming up of work group with mixed specialties (1), pre-distribution of reading materials (1), participatory learning method (1), and use of audio and visual material during instruction (1)

Even though it was not specifically indicated at the above list of training design factors, the role of training coordinator was indicated as an important factor for the success of the training. Coordination was especially required, not only for translating the instruction during class, but for guiding the trainees with appropriate suggestions during the daily wrap up meeting regarding the application of their learning to jobs and tasks. To do

this, the coordinator needed to understand the trainees' jobs and work environment.

The self-directed wrap up meeting seemed to help the trainees in several ways. First, it provided the trainees an opportunity to reflect daily learning and relate the learning to jobs and tasks. Second, several trainees mentioned that the daily wrap up meetings helped them clarify some of the confusing concepts of performance improvement technology. Third, the wrap up meetings also helped novice trainees in computer technology understand basic technical concepts and network terminology. Whenever a trainee raised a technical question to the whole group during the meeting, one of the computer specialists answered the question.

Discussion

Several themes emerged from the data analysis of perceived learning and transfer and the examination of actual examples of transfer. These themes and their resultant implications are organized around degree of learning, training transfer, and training design.

Degree of Learning

The ten trainees who participated in the performance improvement technologies training program showed different perceived degrees of learning and training transfer from the data analysis. In general, all ten trainees showed a high perceived degree of learning. From the responses of all ten trainees, one pattern of learning were found. Even though the perceived degree of learning for all trainees was satisfactory, the training objectives in the conceptual domain seemed to be relatively more difficult to learn than skill-related training objectives. Among the seven training objectives that showed low perceived degree of learning, only one was related to skill-related objectives while the other six objectives were conceptual.

There were numerous reasons for low or high perceived learning, but one distinct category was found to influence the learning to a great degree. It was the category of reasons related to job application of the training that accounted for most of the reasons for low perceived learning (i.e., forgetting due to lack of opportunity to use on the job) and for high perceived learning (i.e., highly related to my job and opportunity to apply on the job). From this finding, it seems that job related reasons had the strongest influence on learning. Other major reasons for low or high perceived learning were also found to influence the trainees' learning. Those reasons could be classified into two categories. The first category included the personal reasons for using what was learned such as lack of interest or previous understanding of the training content. The second category included training design aspects that account for high perceived learning such as examples and demonstration, practice opportunities, class projects, and daily wrap up meetings.

Transfer of Learning

The trainees seemed to have many chances to transfer the training objectives to their jobs and tasks, but they showed different perceived degrees of transfer among them. In general, transfer of training showed a relatively lower perceived degree than that of learning. It is indicated, however, that job related reasons had the greatest influence on training transfer. Of the reasons for low perceived transfer, job related reasons such as lack of opportunity to apply on the job or information that is not directly related to their job had the most influence on transfer. Of the reasons for high perceived transfer, job related reasons such as opportunity use on the job has the most influence.

In contrast to learning, conceptual related training objectives were perceived to be more highly transferred by the trainees than specific knowledge or skill related objectives. The training objectives covering "learning principles and theories" and "conceptual understanding of performance improvement technologies" were perceived as highly transferred objectives. Training objectives covering "specific knowledge to master skills for distance learning technologies" and "skills for distance learning technologies" were perceived to be less well transferred. The reasons for this could be based on the job characteristics of the trainees. As indicated from the reasons for high perceived transfer of training, the trainees were more engaged in tasks that required mental or conceptual activities than did in skill related tasks.

Training Design

From previous research studies, several training design variables were found to influence the transfer of

training such as identical elements between the learning and job setting, stimulus variability in instruction, teaching of general principles (Baldwin & Ford, 1988), and overlearning (Hagman & Rose, 1983). The findings of this study also showed similar evidence with these research studies. First, the training content was said to be mostly identical with the trainees job requirements except one technical difference in language conversion for a software program. Second, use of various instructional methods, such as examples and demonstration, practice session, and project completion, seemed to promote better learning during the training. Third, overlearning seemed to promote the retention of trainees' learning after the training. Many trainees seemed to remember the learning principles, which were emphasized several times by one instructor, six months after the training.

From the data analysis, 9 out of 10 trainees indicated that they had a project to complete after the training. One of the trainees even mentioned that the training program was successful because most of the trainees were assigned some types of projects to complete after the training. From this, the transfer variables such as motivation and goal-setting might be drawn not only from personal characteristics but also affect learning and training transfer as the training design factors.

Conclusion

Not all learning from any training program can be expected to be transferred or applied to jobs and tasks for the trainees. This is especially true for the case of international transfer of training. To assure the maximum transfer of a training program several considerations must be made prior to and during the training program. First, to make a good training design that accommodates the cross cultural training needs, thorough training needs assessment at the individual participant level seems important to ensure the success of training transfer as well as the quality of training. Good training needs assessment always improves the quality of a training design as well as delivery of the training. Second, the use of diverse instructional methods is considered an important strategy for training design that leads to successful training transfer. By providing learning experiences in different ways, the trainees can master the training content conceptually and experientially. Diverse learning stimuli also helps retention of the learning to a great degree. Third, in the case of delivering training programs for foreign students, the instructor's sensitivity to the cultural differences that students may experience during the instruction is an important factor for successful training. The course coordinator also plays a critical role in guiding the students' learning and application of the learning back to the jobs and tasks.

Several research implications surface from this study. First, it appeared that trainee personality variables influenced the learning and training transfer, but were not explored in this study. Including the variables of trainee characteristics in future research designs will enhance breadth of future studies. Second, this study focused on the transfer of training in international settings. Comparing the differences found in the transfer of training between domestic and international settings is an interesting topic in need of study. Third, studying the transfer of training in different training delivery environments, such as using distance education technologies, will be another way to study the transfer of training between countries.

Cross Cultural Effectiveness: A Case Study of Cultural Conflict Incidents

Carey C. Coghill
Coghill & Beery International

Rapid expansion of global business has challenged HRD to meet the needs of transnational leaders and global knowledge workers. The broad problem addressed by this study concerns the cross-cultural effectiveness of American expatriates living in the United Kingdom. It was concluded that the differences in cultural assumptions between the US and UK are greater than expected, and that provision of skill training in cross-cultural conflict resolution, cross-cultural communications, and coping resources for stress could address deficits identified by this study.

Keywords: Cross Cultural Effectiveness, Cross Cultural Conflict Resolution, Global Leadership Development

After they surveyed existing literature and current practice, Black, Mendenhall, & Oddou, (1991) referred to the literature on cross-cultural training for business purposes as "pre-paradigm" and recommended use of ethnographic research to expand the knowledge base. The research strategy for this study was case study. The purpose was to describe cross-cultural conflict incidents and to illuminate factors that may be affecting cross-cultural effectiveness.

Research Problem

International experience is fast becoming a career development prerequisite for executive management positions (Brewster, 1991). The need for effective use of knowledge and experience across borders accompanies the expansion of global business. Recent trends include the changing characteristics of potential expatriates. For example, the percentage of dual-career couples, who may be negatively impacted by an international assignment, is increasing steadily. It is estimated that dual career families will account for 63% of married couples in the US by 2000 (Employee Relocation Council, 1987). Expatriate female employees constitute a relatively small segment, estimated to range from 3-7% percent, at present. However, this group is viewed as the beginning of a new trend (Adler, 1994). Expatriates from third countries, who are neither host nationals or headquarters employees, are being used in a small but growing number of companies with a strategic approach to global managerial and organizational development. Additional trends in relation to expatriate turnover and attrition are emerging. A typical expatriate in the 1990s is expected to fulfill one or two international assignments (Brewster, 1991). This reality contrasts with the previous practice of using a cadre of career expatriates who were moved from country to country over a lifetime of employment. Attrition rates after an international assignment range as high as 40% within the first 2 years of reentry. Consequently, global HRD expertise is needed to retain employees who have gained valuable experience on international assignments. Clearly, the organizational benefits of global leadership development systems and international networks are becoming more apparent.

Research Questions.

The broad questions, which guided this study, included the following: How can HRD assist expatriates and accompanying family members in developing intercultural effectiveness? What can be learned about how to lessen culture shock and cross-cultural adjustment? How do skill and knowledge deficits influence cross-cultural conflict incidents and intercultural effectiveness? The multiple factors contributing to successful cross-cultural transition and effectiveness have not been clearly identified in previous literature. The focus questions that guided this study were as follows:

1. How do violated expectations play a role in culture conflict incidents between American expatriates and UK host nationals? (Burgoon, 1983)
2. How do expatriates exhibit cross-cultural skills, or lack thereof, in the resolution of cross-cultural conflict incidents? (Ferraro, 1990)

Copyright 1999 by Carey C. Coghill

3. What can be learned about the implications for social skills training from US-UK conflict incidents? (Furnham & Bochner, 1986)
4. What can be learned about the implications of cross-cultural stress and coping resources for stress in relation to resolving cultural conflict incidents? (Matheny, Curlette, Aycock, Pugh, & Taylor, 1987).

Research Design

The research strategy was case study. Descriptive data about their experiences were collected from 16 American expatriates in London, using structured interviews that encouraged story telling. Triangulation interviews were conducted with 10 British host nationals. Each semi-structured interview consisted of questions regarding cross-cultural conflict situations and how they were resolved. The subjects constituted a group purposefully selected as the unit of analysis. The present study represents a single case (a single unit of analysis) but the interviewing proceeded to saturation, that is, until conflict patterns were often repeated in the interviews. The unit of analysis provided a unique research opportunity. As the researcher, I was a US expatriate who lived and worked in the UK for six years. This provided an unusual mode of entry to interviews with expatriates (US citizens living in the UK) and with host nationals (British citizens working with Americans). The criteria for inclusion resulted in a group of new expatriates who were able to provide data rich with fresh impressions. In addition, I was able to include participants who are representative of future trends in expatriation: dual career expatriate couples, female expatriates, and male accompanying partners.

Preliminary Study

The researcher designed, developed, and presented a 3-day program entitled In-Country Cross-Cultural Transition Skills Training. The design phase included: 50 needs assessment interviews in the US, Belgium, England, and Germany; a review of cross-cultural training programs and of models useful for designing cross-cultural training; a review of the literature on cross-cultural training content and effectiveness; and a review of assessment instruments useful for cross-cultural training. The training was designed to meet the needs of expatriates and spouses during an international assignment. It was conducted on a pilot project basis in the United Kingdom in 1993. Because of the success of the pilot program, the researcher subsequently conducted the program on 12 other occasions in 3 other countries (Brussels, Belgium; Frankfurt, Germany; and Washington, DC) between 1993 and 1996. Since 1994, the In-Country Skills Program has been conducted in shorter versions (one-half to two days) in a number of different organizations. The 3-day skills program includes the following: Module 1: Culture, cultural assumptions, culture shock & adjustment; Module 2: Cross-cultural adaptability, managing transitions; Module 3: Cross-cultural clash, cross-cultural problem solving skills; Module 4: Cross-cultural communication skills and negotiating skills; Module 5: Cross-cultural stress and coping resources for stress.

Procedure. Qualitative analysis of the interviews employed pattern matching strategies to identify differences in cultural assumptions and their influence on cross-cultural conflict incidents and to identify how coping resources for stress may influence coping responses in US-UK conflict situations. Reviews by peers and British host nationals were used to validate and modify interpretations that emerged from the pattern analysis of the interview data. The following expected patterns were identified:

Expected Pattern 1. Cross-cultural conflict incidents between US expatriates and UK host nationals will include expectancy-violations. Expectancy-violation theory (Burgoon, 1983) focused on how violations of expectations about another person's behavior lead to positive or negative evaluations of that person. Expectancy violation theory is particularly applicable to cross-cultural conflict interactions.

Expected Pattern 2. Cultural distance will be a factor in the US-UK cross-cultural conflict incidents. Cultural distance is a theoretical perspective which posits that the more dissimilar a new culture is from one's home culture, the more difficult the adjustment will be during expatriation (Mendenhall & Oddou, 1985). This perspective is based on the assumption that if an expatriate is unable to identify or perform appropriate behaviors, adjustment will be more difficult. This pattern expectation was not intended to imply that the degree of cultural distance would be as great in American-British interactions as it would be, for example, in American-Chinese interactions. Instead, the cultural distance theory was expected to serve as a distraction from accurate expectations and anticipatory preparation, which is similar to the reentry transition expatriates experience upon return to their home culture (Black et al., 1991; Weaver, 1993)

Expected Pattern 3. The use of cross-cultural skills will have a positive impact on the resolution of cross-cultural conflict incidents. The pattern analysis will use Ferraro's (1990) taxonomy of cross-cultural skills, which includes: tolerating ambiguity, being flexible, having patience, displaying empathy, being resourceful, personalizing observations, showing respect, being non-judgmental, and having a sense of humor.

Expected Pattern 4. The use of coping resources for stress, as defined by the Coping Resources Inventory for Stress (Matheny, et al., 1987), will have a positive impact on the resolution of cross-cultural conflict incidents. The management of cross-cultural stress has been identified as a dimension of cross-cultural adaptation. Development of cross-cultural coping resources for stress may provide valuable tools for expatriates in cross-cultural conflict situations.

Analysis. Merriam (1988) stated, "qualitative researchers are interested in how people make sense of their lives, what they experience, how they interpret these experiences, how they structure their social world" (p. 19). Following the recommendation of Goetz and LeCompte (1984) the researcher organized the case data base and read all of the data several times. During multiple readings, the investigator made notes, comments and questions in the margins of the transcripts. This stage is vital because the initial notations allow the investigator to note the most striking information. This begins the process of organizing, abstracting, integrating and synthesizing that will lead to the researcher being able to communicate what has been observed.

The notes were then developed into an outline or system of classification into which the data was sorted. This outline aided the investigator in finding regularities and patterns. The patterns were then made into categories into which the subsequent items were sorted. The patterns or categories emerged from the data. Lincoln and Guba (1985) recommend using, "*units of information* that will, sooner or later, serve as the basis for defining categories" (p. 344). *Culture Clash Incident*, the unit of information chosen by the researcher, met the criteria for selection delineated by Lincoln and Guba (1985). A *Culture Clash Incident* was defined as an incident or scenario that is an example of cross-cultural differences or cross-cultural conflict between persons from different cultures. A culture clash incident often occurs as a result of perceived unmet expectations that are a result of differing cultural assumptions.

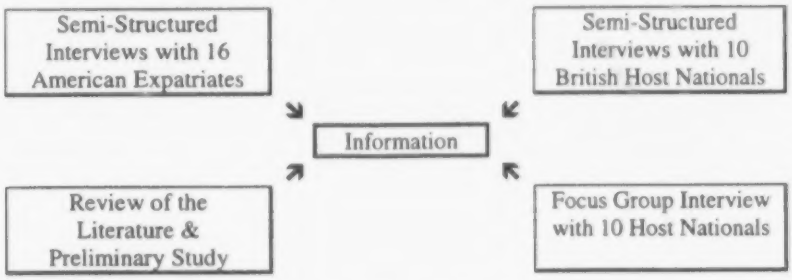
After the unit of information was identified, each interview transcript was read an additional six to eight times and a running log of culture clash incidents was created. The resulting Culture Clash Log that includes a total of 78 clash incidents was developed. Each conflict incident was then categorized in relation to broad cultural assumption continua. On the first pattern sorting, the researcher used classic anthropological continua from the seminal work, in 1961, of Florence Kluckhohn & Fred Strodtbeck: (1) *Man-nature orientation*, (2) *Time orientation*, (3) *Activity orientation*, (4) *Relational orientation*, and (5) *Nature of man orientation*.

In the first sorting, a number of culture clash incidents did not match the broad categories used by Kluckhohn & Strodbeck. This led to consideration of other possible explanations for the emerging patterns. Two more continua from research by an American anthropologist, E. T. Hall, matched the data from the pattern analysis and were added. These were *Sense of Space*, or *Proxemics*, and *High and Low context* in communication styles (Hall, 1976). Cultural Theory by a British social anthropologist, Mary Douglas, provided the frame of reference for two additional categories which emerged from the data: *Power and empowerment*, and *Social Relationships* (as cited in Kim & Ofori-Dankwa, 1995). Research by Noesjirwan (as cited in Furnham & Bockner, 1986) provided the structure for the category of *Social Interaction Values and Behaviors*. A final category that is unique to this study was defined as a continuum for *Trust and Safety Concerns*.

Validity and Reliability. Yin (1994) recommended three principles of data collection to maximize the benefits of using case study as a research strategy. Each of these principles has been incorporated into the design and implementation of this case study. The first, multiple sources of evidence, is presented in Figure 1. According to Yin (1994):

> [T]he most important advantage presented by using multiple sources of evidence is the development of converging lines of inquiry, a process of triangulation .... [A]ny finding or conclusion in a case study is likely to be much more convincing and accurate if it is based on several different sources of information, following a corroboratory mode. (p. 92)

Figure 1. Convergence of Multiple Sources of Evidence in a Single Case Study



Semi-Structured Interviews with 16 American Expatriates
Semi-Structured Interviews with 10 British Host Nationals
Information
Review of the Literature & Preliminary Study
Focus Group Interview with 10 Host Nationals

Since multiple sources of evidence essentially provide multiple measures of the same phenomenon, triangulation results and with it the potential problems of construct validity can be addressed. This study has employed: (a) multiple data sources (data triangulation); (b) multiple evaluators (investigator triangulation); and (c) application of multiple theories to the same data set (theory triangulation). The second quality principle recommended by Yin (1994) is to create a case study data base. This allows the data base to be the subject of a separate secondary and independent analysis of the case report by the original investigator. The data base for this study includes the following: (1) American expatriate interviews: Sixteen audio tapes (averaging one hour in length), hard-copy transcriptions of the interviews, and computer disk files of the transcriptions. (2) British national interviews: Written summaries of 10 British interviews compiled immediately after the interviews from field notes taken during the interviews. (3) British national focus group: (a) a summary of the written responses from 10 London university students to questions regarding the Coping Resources Inventory for Stress (CRIS); (b) a typed transcript of a focus group discussion held to solicit feedback regarding the cross-cultural interpretation of individualized reports on coping resources for stress. The third quality principle is to maintain a chain of evidence that allows an external observer to follow the derivation of any evidence from the initial research questions to the case study conclusions for increased reliability. This was accomplished by making use of citations to the relevant portions of the case study database, by ensuring that the database included actual evidence, and by ensuring a clear link between the content of the protocol and the initial study question (Yin, 1994).

Results and Findings

Qualitative analysis of the expatriate interviews employed pattern matching strategies to identify 78 cross-cultural conflict incidents which were grouped into 10 primary categories and 25 subcategories of US - UK cultural assumption differences. The validity of these categories was then subjected to peer analysis, US and UK participant review. The same strategy was used to match 30 British triangulation cultural conflict incidents to the ten primary categories. Methods used to accomplish interpersonal conflict resolution were then compared to a taxonomy of cross-cultural skills (Ferraro, 1990) and coping resources for stress (Matheny, et al., 1987). Table 1 (see Table 1) presents a model of the US and UK cultural assumptions evident in this case study. The culture conflict incidents were matched with accepted cultural orientation continua from the literature review. The values, beliefs and behaviors that emerged from the pattern analysis matched positions on the continua presented.

Conclusion 1.

Expectancy-violations played a major role in the cultural conflict incidents described by the participants. The quantity and quality of information gathered regarding US and UK cultural assumption differences exceeded expectations. When asked to describe a situation involving cross-cultural differences or cross-cultural conflict, the 16 participants provided descriptions of 78 cross-cultural conflict incidents. The vast majority had expectancy-violations as a central feature. The majority of expectancy-violations occurred during conflict incidents that took place between American expatriates and British providers of customer services or goods. The following pattern sequence was seen repeatedly. When an American expatriate described a problem situation to a British service provider, he or she expected to engage the service provider in a problem-solving effort until the issue was resolved. However, in most cases the British service provider was either not prepared or not empowered to participate in problem resolution with the customer. When the expatriate complaint was met with indifference, or inflexibility, or

referred to a higher level, the conflict between the sender and receiver either escalated or was left unresolved in the majority of culture clash incidents.

Conclusion 2.

The Cultural Distance theoretical perspective, in its entirety, was not supported by this study. US expatriates in the UK repeatedly experienced difficulties in identifying and performing culturally appropriate behaviors. Adjustment was therefore more difficult than expected. In addition, because difficulties were not anticipated (and culture distance was assumed to be minimal) the negative impact on the expatriate's adjustment was greater than anticipated. Recent work by Brewster (1994) on British and Swedish managers provides a foundation for what may develop into a rival theory to the Cultural Distance theory. Brewster (1994) summarized a 1971 study by Franko that empirically challenged cultural distance by showing that the US had the most failures in joint ventures with Canada and Ireland. In addition, Brewster reviewed studies of United States and Swedish interactions that have experienced problems despite having similarly developed cultures.

Table 1. US-UK Cultural Orientation Continua

US-UK Cultural Orientation Continua			
Orientation	**Basic Values, Beliefs & Behaviors**		
1. Social Interaction	Formal & Reserved	^ v	Informal & Extroverted
2. Sense of Time	Past Oriented	^ v	Future Oriented
3. Work Roles & Empowerment	Hierarchy Authoritarian	^ v	Flat Structures Democratic
4. Social Relationships	Ascribed Status	^ v	Achieved Status
5. Context	High Context	^ v	Low Context
6. Action Orientation	Being	^ v	Doing
7. Sense of Space	Internal Space	^ v	External Space
8. Relationship between Society & Individual	Group Oriented	^ v	Individualistic
9. Safety Needs Met; Trust Relationships	High Comfort Level and Trust	^ v	Low Comfort Level & Distrust
10. Control Over Nature & Ability to Change	Life is Unchangeable	^ v	Life is Changeable

Language difficulty is usually listed as the most significant barrier to cross-cultural communications during an international assignment. For example, it is easy to understand why a successful corporate executive expatriate might tend to isolate within the American or English speaking sub-culture. One of the strengths of this study was the common language of English. The researcher was able to analyze the cultural assumptions underlying the US and UK conflicts and to explore the subtle differences in cultural codes, rules, and context.

Conclusion 3. In the majority of cultural conflict incidents, cross-cultural skills were noticeably absent. In particular, lack of culture-specific knowledge about UK cultural assumptions was evident. In addition, there was a lack of self-awareness, on the part of the American expatriates, of their own cultural assumptions and personal value systems. The pattern analysis began with the use of Ferraro's (1990) taxonomy of cross-cultural skills. Although

concepts such as "having patience" are readily understood, these proved too broad for the analysis (i.e., these descriptions were not operationally defined to the extent needed to distinguish between the more effective resolution of conflicts and the less effective attempts.) A description of more specific or observable cross-cultural skills was needed to analyze the detail contained in the interview transcripts. Therefore, the Culture-Learning Social Skills Model was used and the expected pattern was restated to include specific cross-cultural skill or knowledge deficits and the resulting impact on cross-cultural conflict incidents.

The Social Skills Model considers learning the "salient characteristics of the new culture" to be the major task of the expatriate. In this approach, learning the behaviors of a new culture is not conceptualized as an adjustment process with ethnocentric overtones. Instead, it is an expedient process in which the expatriate adopts new behaviors on a temporary basis (Furnham & Bochner, 1986, p. 235). For example, a Briton living in Tokyo would quickly learn to abandon his or her habit of queuing for a subway or train. Specific, operational definitions of skill deficits are possible with this model. In the majority of the conflict incidents analyzed there was a lack of knowledge or a lack of cross-cultural skills on the part of the expatriate or the host national, or both. When a cross-cultural conflict was resolved or later understood, the acquisition of additional culture specific information, culture general knowledge, or cross-cultural skills was apparent in each of the explanations given by the expatriate.

Conclusion 4. The concepts underlying the Coping Resources Inventory for Stress (CRIS) scales provide a structure for the expatriate to evaluate cross-cultural clash situations from a different perspective and to make alterations or accommodations. In several conflict resolution descriptions the participants described the use of *cognitive restructuring*, in that they attempted to place a problem in a different perspective or to view a situation from the perspective of host national. This process is referred to in the cross-cultural literature as using empathy, isomorphic attribution, or an ethno-relative perspective (Bennett, 1993; Lewis, 1996; & Triandis, 1990). *Confidence*, another concept addressed by the CRIS, is described as "faith in one's ability to cope successfully with stressful life situations" (Curlette, Aycock, Matheny, Pugh, & Taylor, 1987). Persons, who score high on the confidence scale, believe in their ability and usually expect to succeed. Mendenhall and Oddou (1985) found that one of the primary individual factors relating to in-country adjustment was a *self-oriented skill* which was defined as the ability to believe in oneself and one's ability to deal effectively with the foreign surroundings, even in the face of great uncertainty. This *self-oriented skill* was found to be quite similar to what Bandura (1982) referred to as *self-efficacy*. In an international assignment, self-efficacy, or confidence, drives the person to persist in trying new behaviors which, in turn, facilitates adjustment. When asked, "Who was the hero, heroine, or positive force in the story?", a number of participants answered, "I was, because I persevered."

Limitations of the study. This study has focused on cross-cultural conflicts between two relatively similar cultures, the US and the UK. It has used a purposefully selected unit of analysis to examine critical theoretical propositions. While insights have emerged that may be helpful in other cross-cultural situations, no statistical generalization of the findings to other situations is implied.

The aim of this research design has been toward analytic generalization or Level Two Inferences. According to Yin (1994), this level of generalization is appropriate for a quality case study. Yin argued that researchers should use tactics throughout the design and implementation of a case study to apply the four tests commonly used to establish the quality of empirical social research: construct validity, internal validity, external validity, and reliability. These tactics were employed.

Implications for HRD and Summary

Because cultural distance is assumed to be minimal, expectancy violations are not anticipated and cross-cultural skill and knowledge deficits seem unlikely, cross-cultural skill training for US-UK interactions is rarely provided. Most of the interview participants were surprised by the degree of cultural difference experienced and few demonstrated the knowledge or the cross-cultural skill repertoire needed to manage cross-cultural conflict situations effectively. Several implications emerged from this study which warrant further research. They are presented as myths for the purpose of encouraging new questions about the pre-paradigm state, which currently exists in the area of cross-cultural preparation and effectiveness for business related expatriates.

Myth 1. When moving from one culture to another, it is less likely that an expatriate will experience culture shock or a period of cross-cultural adjustment if the two cultures are similar. This study suggests that it is more useful to examine cross-cultural adjustment in relation to expectancy violation rather than the degree of cultural distance or culture novelty . These findings match those of re-entry studies in which repatriates describe unexpected culture shock upon re-entry to their home culture. The pattern analysis revealed skill and knowledge deficits in 10 specific cultural assumption categories and 25 sub-categories. Perhaps subtle cultural differences that

are slowly discovered over time have as great an impact as obvious cultural differences that are quickly recognized. One of the interview participants used the phrase "it was as if we were speaking different languages;" another said, "I'm always standing on one foot -- never able to get my balance," to describe the impact of cultural differences between the US and the UK, two seemingly similar cultures. Adherence to the construct of cultural distance could be limiting research on the subtle interpersonal learning, which is a component of cross-cultural effectiveness.

Myth 2. Provision of pre-departure training is adequate preparation and support for the development of cross-cultural transition and cross-cultural effectiveness skills. This study challenges the belief that a pre-departure program is adequate for cross-cultural skill development and skill transfer. Pre-departure training is usually composed of (a) an introduction to culture-general information, and (b) country-specific briefing information. Provision of accurate pre-departure information is critical. However, if the information is inaccurate, or incomplete, it may encourage stereotyping and a false sense of cross-cultural expertise. In this study a number of conflicts centered on subtle cultural differences such as social class and regional variations within the United Kingdom. The timing for a deeper understanding of cross-cultural negotiation or conflict resolution skills, for example, is after the expatriate has had enough time in-country to discover and appreciate the impact of culture.

Myth 3. A taxonomy of Cross-cultural skills (Ferraro, 1990) provides a description of the skills needed for effective cross-cultural interactions. Ferraro's taxonomy provides a foundation description of desirable behaviors, skills and attitudes for a discussion of intercultural effectiveness. However, it does not reach the level of specific skill analysis that takes interpersonal and situational factors into account Models using Culture Learning and Social Skills theory have attempted to reach the level of analysis required to determine cross-cultural skill-knowledge deficits in specific interactions. To propose taxonomies, which include broad culture-general skills and personal attributes, confuses the issues involved in training for cross-cultural effectiveness. The HRD focus is more appropriately placed on analysis of skill and knowledge deficits within cross-cultural interactions.

Myth 4. If expatriates have adequate skills in problem solving and conflict resolution in their native culture, those skills will be appropriate and transferable to other cultures. It is probable that a number of problem solving skills are transferable from the US to the UK cultures. However, this study revealed that some conflict resolution skills, which had been used successfully in the US, proved to be less appropriate for use in the UK. In the conflict incidents described, the skills that proved to be less successful in resolving conflict situations, included assertiveness skills, (or *self-directedness* on the CRIS scales), mutual problem-solving based on power equity, and *self-disclosure*. The 10 Britons at the University of London who took the CRIS and participated in a feedback session provided information on a number of subtle differences between the US and UK cultures. For example, when an American Expatriate uses *self-disclosure* as a coping resource for stress, the intention may be to build a relationship capable of providing social support. Such an action, however, may be interpreted by a British host national as an invasion of privacy and might be met by a negative response. In addition, Britons may be less likely to use "American assertiveness," which may be viewed as aggressive.

The data in the cross-cultural conflict incidents in this study also raised questions in relation to span of control for the expatriate and the host national. When external stress demands, such as the distribution of resources, are central to a conflict, the demands may be beyond the span of control of the participants in the cross-cultural conflict interaction. When a mutually agreed upon resolution was attempted after a cross-cultural conflict incident, the following were evident: (a) an awareness of external and internal stress demands, (b) an awareness of power equity issues, (c) cross-cultural skills in problem solving and conflict resolution, and (d) skills in coping resources for stress.

Summary

The purpose of this study was to describe cross-cultural conflict situations and to illuminate factors that may be affecting cross-cultural transition and cross-cultural effectiveness. This descriptive case study has added to the body of knowledge regarding intercultural effectiveness with the ultimate aim of improving Human Resource Development services for individuals and organizations in the expanding global arena.

Re-conceptualizing Marsick and Watkins' Model of Informal and Incidental Learning in the Workplace

Maria Cseh
Oakland University

Karen E. Watkins
The University of Georgia

Victoria J. Marsick
Teachers College, Columbia University

This paper presents an empirically grounded re-conceptualization of Marsick and Watkins' (1990, 1997) models of informal and incidental learning in the workplace. The re-conceptualized model encompasses the learning perspectives of small business owner-managers who work in the volatile political and economic environment of the transition to a free market economy in Romania, a group that has not been represented in previous research based on these models.

Keywords: Informal and Incidental Learning, Theoretical Model Building

The seeds of informal and incidental learning concepts were planted long before scholars and practitioners began to use these terms. In the 1920s and 1930s, Lindemann (1926) and Dewey's (1938) vision of learning emphasized the role of reflective thought in education and the importance of learning from experience and lifelong learning. Although Knowles (1950) introduced the term informal learning in his pioneer work entitled *Informal Adult Education*, only in the last two decades did researchers embark on defining and studying this type of learning (Bell, 1977; Mocker & Spear, 1982; Marsick & Watkins, 1990, 1997; Watkins & Marsick, 1992; Center for Workforce Development & Education Development Center, 1998; Garrick, 1998; Lohman & Woolf, 1998). A search of Dissertation Abstracts International alone revealed 143 dissertations between 1980 and 1998 that discussed issues surrounding informal learning. The studies cover a wide variety of settings such as health care (La Paro, 1991; Larson, 1991; Menard, 1993; Murray, 1993; Carter, 1995; Rossi, 1995); education (Selke-Kern, 1986; Mealman, 1991; Dowrick, 1992; Ahmad, 1994; Mott, 1994; Lewis, 1995); and business (Carrigan, 1989; Dechant, 1989; Howe, 1991; Macmahon, 1992; Volpe, 1992; Diaz-Alemany, 1993; Morton, 1993; Stevens, 1993; Bierema, 1994; Shapiro, 1994; Ellinger, 1997; Cseh, 1998). These studies attest to the importance and prevalence of informal and incidental learning in the workplace.

About a decade ago, Marsick and Watkins (1990), based on their research and inquiry into the learning process, set out to describe and define informal and incidental learning. Their journey in the realm of informal and incidental learning is still continuing while more than twenty of their students have used their models (1990, 1997) to explore the informal and/or incidental learning of different professionals or groups of people. The need to re-conceptualize Marsick and Watkins' (1990, 1997) models came from the theoretical implications of Cseh's (1998) study of the learning of owner-managers of small, successful Romanian companies working in a volatile environment so different from the relatively stable context of studies conducted in the United States and Western Europe. This study was not designed to empirically test these models, but to elaborate on the triggers, learning strategies, and lessons learned. Although this study added thick description to these three components of the models, the question of what is not captured in the models seemed worthwhile to explore and an empirically grounded re-conceptualization of the models into a model that incorporates that learning was a result of our exploration. In the following sections we define informal and incidental learning, present Marsick and Watkins' (1990, 1997) models, Cseh's (1998) contributions, and our re-conceptualized model.

Defining Informal and Incidental Learning

As the concepts of informal and incidental learning, natural learning, experiential learning, everyday learning, intentional learning, nonformal learning, self-directed learning, self-planned learning are used interchangeably in the literature and they are in contrast with formal learning; we consider it important to define these concepts. Formal

Copyright © 1999 Maria Cseh, Karen E. Watkins, & Victoria J. Marsick

learning is typically formally structured, institutionally sponsored, classroom-based learning where an educational agent -- educator or trainer -- is responsible for planning, implementing and evaluating the learning that takes place (Brookfield, 1983; Marsick & Watkins, 1990; Merriam & Caffarella, 1991; Watkins & Marsick, 1992).

We define *self-learning* as the learning initiated by the learner that can happen either in formal or informal settings. In contrast with formal learning, *informal and incidental learning* refers to the learning that results from the natural opportunities for learning that occur everyday in a person's working life when the person controls his/her learning. Some types of informal and incidental learning include self-directed learning, social learning, mentoring, coaching, networking, learning from mistakes, trial-and-error. According to Marsick & Watkins (1990, 1997), Watkins & Marsick (1992) informal learning can be planned or unplanned and involves some degree of conscious awareness that learning is taking place. Incidental learning, "a subcategory of informal learning, is defined by Watkins as a byproduct of some other activity, such as task accomplishment, interpersonal interaction, sensing the organization, trial-and-error experimentation, or even formal learning" (Marsick & Watkins, 1990, p.12). Incidental learning is unintentional/unexpected and almost always takes place although people are not always conscious of it. When it remains unexamined, it may lead to reinforcement of misconceptions and prejudices, thus to learning of error or no learning at all, becoming 'miseducative' (Jarvis, 1987). This type of learning is tacit, taken-for-granted, and implicit in assumptions and actions. Examples of incidental learning are learning from mistakes, assumptions, beliefs, attributions, internalized meaning constructions about the actions of others, and in hidden curriculum in formal learning. This learning is of particular interest since it so often is recognized through post hoc reflection. As a result, the role of the learning facilitator is wholly transformed.

Marsick and Watkins' (1990, 1997) Models of Informal and Incidental Learning

Marsick and Watkins (1990, 1997), Watkins and Marsick (1992) developed a theoretical framework and a model for understanding informal and incidental learning in the workplace. As they described, "we based our model on the action science model of Argyris and Schön (1978) that, in turn has roots in John Dewey's (1938) theories of learning from experience and in Kurt Lewin's understanding of the interaction of individuals and their environment" (Marsick & Watkins, 1997, pp. 295-296). This model was developed and refined over the years. In their book *Informal and incidental learning in the workplace*, Marsick and Watkins (1990) present an incidental problem-solving model (Figure 1).

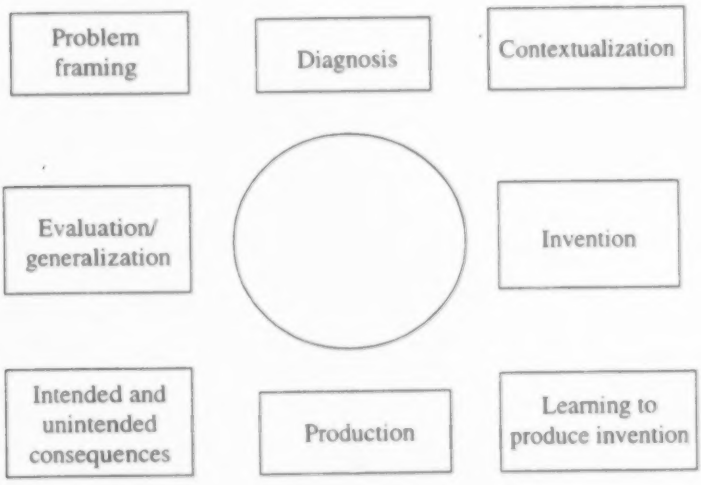

Figure 1. Incidental learning as part of problem-solving model From: Marsick, V. J., & Watkins, K. E. (1990). Informal and incidental learning in the workplace. London, England: Routledge. Reprinted by permission.

In this model, when learning takes place from experience, under non-routine conditions, people frame the situation they encounter (Diagnosis) by using their judgement based on their previous experiences and knowledge (Problem Framing). In order to develop a strategy to deal with the situation, they view solutions through the lens of the context, assessing the constraints and limitations of that context against the feasibility of each solution (Contextualization). Thus, in this model the context is used to test possible solutions. Once a strategy or invention is formulated (Invention), people may need to learn how to produce that strategy (Learning to Produce Invention). The implementation of the strategy (Production) leads to consequences which may be the intended ones or sometimes unintended ones (Intended and Unintended Consequences). People then embed into their consciousness assumptions or generalizations about whether or not the strategy worked. Thus, out of the consequences, meaning is made of the experience and what is learned from the experience is retained (Evaluation/ Generalization).

Marsick and Watkins note that individuals may make errors at any point in this cycle and errors made in an earlier stage almost guarantee errors in later stages. They contend that "Because this problem-solving so often occurs as an automatic process and because so much of the process is tacit or unexamined, the potential for error is great" (p. 225). In order to avoid some of these errors, thus to be more effective in solving problems, the authors underline the need for surfacing this learning. Marsick and Watkins' research showed that critical reflection enabled people to challenge norms and examine the assumptions behind their reasoning and actions. They noticed that "People learned best when they were able to ask questions about why they saw the world as they did, whether their thinking was true, or how they came to believe a perceived truth that they held sacred" (p. 220). They also noticed that this process was mostly enabled through the assistance of facilitators, mentors, colleagues, family, or friends whose feedback opened the learners up to other points of view.

Marsick and Watkins (1990) also developed a model of informal learning that is essentially a problem solving model: formulate a problem, design and implement a solution, and assess results. Formulating a problem is preceded by intelligence activity; designing a solution is preceded by design activity and followed by choice activity; and implementing a solution is followed by experimenting activity. These stages were merged in the 1997 model. In 1997, Marsick and Watkins present a revised model of informal and incidental learning (Figure 2).

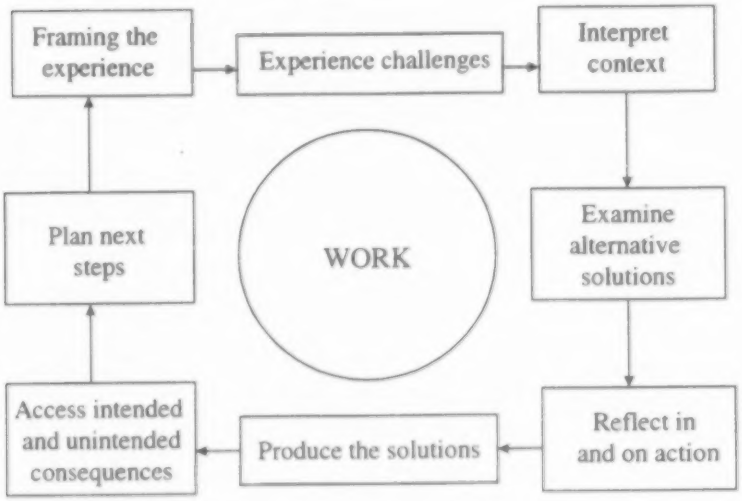

Figure 2. Informal and incidental learning model
From: Marsick, V. J., & Watkins, K. E. (1997). Lessons from informal and incidental learning. In J. Burgoyne & M. Reynolds (Eds.), Management learning: Integrating perspectives in theory and practice (pp. 295-311). London: SAGE Publications. Reprinted by permission.

Based on insights gained from action science and theories of learning from experience, Marsick and Watkins reinforce the idea that problem solving is not linear and thus, their model is neither linear nor prescriptive. As they describe it, "steps such as observation and reflection are interwoven throughout various phases of the model, and the learning process varies because of the situation in which people find themselves. The problem-solving cycle is

embedded within a sub-surface cycle comprising the beliefs, values and assumptions that guide action at each stage" (p. 297). Marsick and Watkins remind again that because informal and incidental learning is seldom consciously and critically examined, it is subject to a high degree of misinterpretation. Thus, they emphasize the need to identify and acknowledge the tacit beliefs, values, assumptions, contextual factors and unintended outcomes.

A Re-conceptualized Model of Informal and Incidental Learning

The need to address the re-conceptualization of Marsick and Watkins' (1990, 1997) models came from the findings of Cseh's (1998) study. This study emerged from the researcher's interest in helping managers in Central and Eastern Europe cope with the unprecedented changes they were facing. As Child and Czegledy (1996) noted, "Since 1989 the area has been experiencing economic and political reforms of immense proportions. It has become a 'living laboratory' in organizational transformation within a context of profound institutional change" (p.167). The purpose of Cseh's (1998) study was to examine the critical learning experiences which enabled owner-managers of small private companies in Romania to lead successfully in the transition to a free market economy, in order to determine what triggered their learning, what strategies they used, and what lessons they learned. In-depth, face-to-face interviews using the critical incident technique were conducted with 18 managers. Fifteen managers, between 28 and 62 years of age and representing both genders and the nationalities (Hungarian and Romanian) specific to the two Romanian regions selected, were included in this study. Seventy two critical incidents were generated. Content analysis was used to initially code the data in three major categories: Triggers, Learning Strategies, and Lessons Learned. These categories were predetermined based on Marsick & Watkins' theoretical framework. During this process, a new category clearly emerged. This category, "Framing the Business Context," was defined as the constraints and opportunities perceived by the managers in the context in which they operated. A total of 511 data strips were categorized in this way. The third step in analyzing the data was the open coding of the data inside each of the categories to obtain specific themes. For an elaboration of Cseh's specific findings, see Cseh (1999) in these proceedings.

All of the managers participating in this study gave detailed accounts of their perception of the economic, political and social context in which they worked and their learning experiences were all embedded in this context. The fact that 111 data strips represented by sentences or phrases emerged from the data as related to the managers' business context strengthens the argument that learning is embedded in the context of the learner and that triggers for learning are selected based on this framing of the business context.

Based on this study, it is clear that the context permeates every phase of the learning process - from how the learner will understand the situation, to what is learned, what solutions are available and how the existing resources will be used in the learning process. The following examples of critical incidents illustrate the influence of this turbulent context on the learning of the owner-managers.

The changing legal system and its lack of clear rules and ever changing regulations was mentioned by several managers as triggers of their critical incidents and thus of their learning. Although the manager of a company manufacturing leather clothes was assured by authorities that he could take apprentices and certify them, when the time for certification arrived, it turned out that he had no right to certify. He recounted how "until this day the law didn't come out, so private companies can't train, actually they can train but not certify apprentices." This put the manager in a very difficult situation as he promised the parents of his apprentices that in two years they will be certified. And he kept his promise by talking to the director of a Co-op school which had the right to certify. With his help, he organized classes, brought together professionals to teach these classes, and talked to the parents to decide how to divide the instructional fees. All of this involved a tremendous effort, but he managed to solve the situation and learned a lot in the process.

Similarly, government red tape often thwarted these entrepreneurs efforts. No help and support from the government and the problems in dealing with state-owned companies were mentioned by the managers on twenty five (25) occasions as hindrances in their work. When talking about the incident when his company's license was revoked, one owner-manager described how

> The Romanian Transportation Ministry didn't help us at all. To the contrary, they told us to go and solve our problems elsewhere, and that they don't want to get involved in anything. So far, the ministry - and I suppose the government as well, although I didn't work with it directly - didn't support our activities. They don't want to get involved in problem solving, but these small companies which are just forming these days need their help and they should act like a hen for the chicks. Especially since these small and medium size companies, being so many, contribute to the

> country's economy a considerable amount of money in comparison to the big mammoths [state-owned companies] which have enormous losses.

As the re-authorization of the company's license had to be approved both by the Romanian and Hungarian transportation ministers, this unwillingness to help on the part of the Romanian ministry caused the transportation sectors executive director a whole month of commuting between Bucharest and Budapest while he tried to learn how to solve this problem. Although it was never found out who the drivers were who caused this incident, the license was re-authorized after suitcases of files with all of the driving records, stamped with the hours and dates of departures/arrivals, proved the good standing of the company. While telling his story, the manager also remembered how in general:

> It's hard to solve any problem in government institutions. The public office worker here is like [he] always was: he keeps you at the door, and when you enter after three hours waiting he will tell you, 'I don't have time now. Come back tomorrow,' or 'next week,' and when you go back the next week he'll tell you, 'I don't know what I did with your papers.' These things happened to me, like I sent somebody there, and my paperwork was lost and my representative was told, 'I don't have time now, I have to go somewhere. Come back next Monday,' etc. ...This is a phenomenon we all know and it gets us angry, but there is nothing to do about it; so we must go on and hope that things will change in time.

Obtaining a loan from a bank is described by many of the managers as a very cumbersome and difficult process. Rigidity and poor service offered by the banks triggered the learning of several managers in this study. One manager offers an illustrative story. The Romanian market did not provide a domestic-made bus that would meet the international tourism/human transportation requirements, so the manager had to buy buses from Hungary. As these buses are not imported to Romania, an invoice from the vendor had to be presented to the bank which in a few days announced its decision for the amount of foreign currency. And then came the problem as he described it in the following passage:

> Well, if I had found a bus for sale in Hungary, the vendor will not wait for the money transfer, which can take from a week up to a month. He doesn't know me and he will not wait for a month to get his money, especially being in a different country. He is saying: 'Bring me the cash and I'll give you the merchandise, or send me the money and when I get it I will send you the bus.'.

Almost all of the managers talked about their problems in working with state-owned companies which still have the monopoly in a lot of fields and especially as suppliers of raw materials. These companies also prefer to work with other state-owned companies, leaving the private companies on the fringe. Describing the preference of state-owned businesses to deal with their own, and his major problem in getting contracts with the stores which were mostly state-owned, the manager of a sporting goods manufacturing company, said:

> They [state-owned stores] know that my products are good, but some of them just couldn't care less, and they say, 'why should I buy from him when the state-owned company's products are good enough?' There is a state-owned company which in the old times and even now is manufacturing backpacks, catastrophic ones, and better not to talk about their tents. So, they all knew each other these old state-owned businesses. The store managers had friends there, knew the director, the director knew I don't know who and they used to eat and drink together during the so called contract entering times. These old ways of deal makings are still in place. They are organized at the seaside or in other resorts. The only purpose of these gatherings was for the people to spend a good time on company money for two, three days or a week; to eat, drink and enjoy themselves. Thus, this was the essence of these contracting gatherings. In fact they didn't sign contracts, but displayed their products and left them under the surveillance of one or two unlucky young engineers while they were gone eating, having fun, taking a swim, etc. with the directors. So, there were situations like this that they [store managers] knew the director of the state-owned company and although I had products of much better quality, they didn't know me. 'We will go to the state-owned company and buy from them,' they said. If I told them to compare the two products, they told me, 'No, last year we bought our products from them, too.' This is exactly like the story with the street curve. Yesterday I drove in the other lane to cut the curve and

> nothing happened, so I can do it again today. They also bought the same products last year from that company, so this is the mentality.

The old regime mentality and poor work ethic of the employees was another source of major problems according to the managers. The managers interviewed also talked about the mentality of some managers in Romania. One person said:

> And talking about managers, I think that they should try to gather good people in their companies, but this is again a contradiction of the previous mentality when the boss tried to get rid of all the good employees in order to eliminate potential competitors. You see, there are things like these which bring extraordinary contradictions and create problems because a lot of people have still the old mentality. They cannot realize that if you have a good company and you gather around you only incompetent people you are doomed to failure together with your company.

As these examples show, these managers viewed their context as being the whole economic, political and social environment of Romania as part of Central and Eastern Europe. The lenses through which they saw their world framed their critical incidents and learning experiences. The context was sometimes interpreted as a macro level trigger of critical incidents, as a barrier in finding solutions to their problem, or sometimes as offering potential opportunities. Although the context of learning, which is used to test possible solutions, is mentioned in Marsick and Watkins' (1990, 1997) models, its pervasive influence on each phase of the learning process documented here is not depicted in their model.

Analyzing the managers' learning experiences, it also became apparent that the language used in Marsick and Watkins' models (1990, 1997) did not fit the language used by the participants, so further modification of the models seemed appropriate. We therefore have re-labeled the components of Marsick and Watkins' models and embedded the entire model in the context. We created the following new labels: "Frame the context" instead of "Problem framing" or "Frame the experience"; "Triggers" instead of "Diagnosis" or "Experience challenges"; "Choose learning strategies" instead of "Learning to produce invention" or "Reflect in and on action"; and "Evaluate lessons learned" instead of "Evaluation/generalization" or "Plan next steps." An empirically grounded re-conceptualization of the original model into a model (Figure 3) that incorporates the learning processes both in terms of the sequences in which people engaged in them and the language they used to describe them is the result of this exploration.

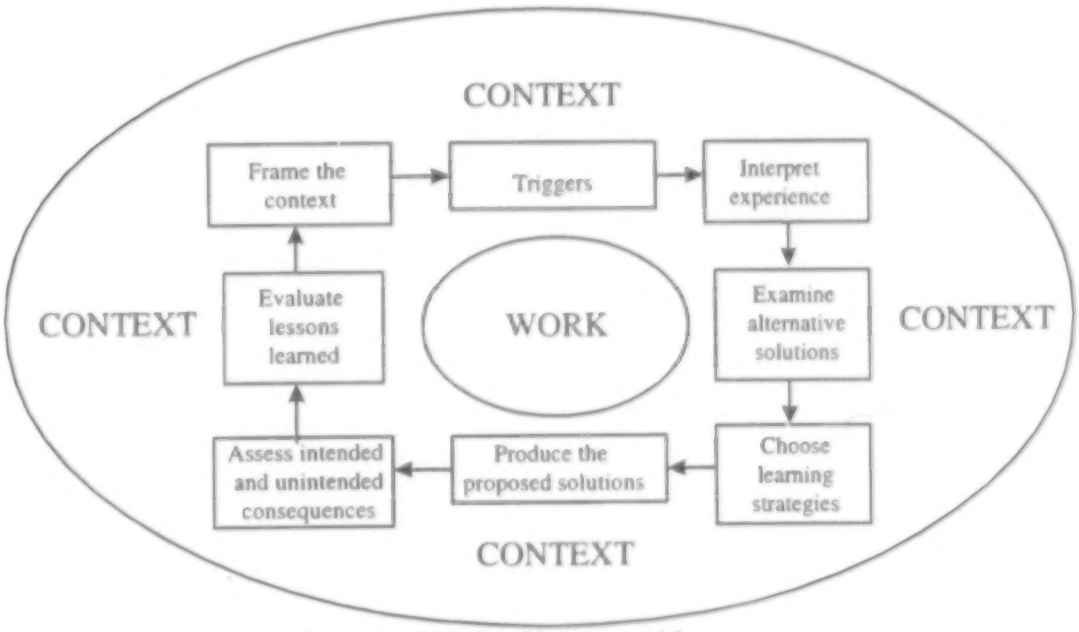

Figure 3. A re-conceptualized informal and incidental learning model

Conclusions and Implications

Reading these critical incidents, it might be reasonable to wonder whether or not this context is too unique to warrant re-conceptualizing this model. Our view is that the extremity of these examples actually made more visible the changes we needed to make in the model. This re-conceptualized model presented in Figure 3 extends Marsick and Watkins' (1990, 1997) and Watkins and Marsick's (1992) theoretical framework and models of informal and incidental learning in the workplace. This model encompasses the learning perspectives of small business owner-managers who work in a volatile political and economic environment, a group that has not been represented in previous research based on these models. Future research may be guided by a stronger, more empirically derived model of learning in the workplace.

Creativity and Design

Sharon J. Korth
Brenda S. Gardner
Xavier University

The creative processes and attributes of ten HRD practitioners were examined in this study, using both qualitative and quantitative methods. Results include a comparison of creativity styles/preferences using the Myers-Briggs Type Indicator and the Kirton Adaption Innovation Inventory as well as a model derived from the data, which describes the creative design process used by the subjects.

Keywords: Creativity, Design, Personality Preferences

This research explored the creative processes involved in the design of human resource development (HRD) interventions. These interventions include systems, processes, and programs to help people gain knowledge and skills so that they can improve their individual, group and organizational performance. Common HRD interventions include training programs, team building consultation, and strategic planning facilitation. While there are models and guidelines for developing these interventions, there is little research on the creative processes involved in their design. For example, how does one generate a novel idea, select an effective strategy, or determine a successful mix of learning activities?

Problem Statement and Theoretical Framework

There is substantial literature and research on designing HRD interventions, both in the areas of training and consultation. Many of these instructional and consulting models offer a step-by-step process to the overall intervention (Block, 1981; Dick & Carey, 1990; Kemp, Morrison & Ross, 1994). Recently, there have been discussions about the iterative, holistic, and chaotic nature of the process as actually practiced, which has resulted in instructional design models with flexible and fluid boundaries, with choices and options, or with numerous recycling loops (Korth, 1997; Seels, 1995; Tessmer & Wedman, 1995).

"To design is to create some new thing of practical utility. The basic act of design is to leap out from what exists to something previously unimagined" (Rowland, 1994, p. 3). Whereas research has been conducted on what designers do in practice (Perez & Emery, 1995; Rowland, 1992), little research has focused on how designers actually make that leap, how they come up with ideas that were previously unimagined.

What is the creative element in this design process? Creativity is commonly defined as the production of ideas that are novel and useful (Puccio, Treffinger & Talbot, 1995). There has been an increased interest in corporate creativity, with studies exploring how innovation and improvement "actually happen" in organizations and identifying elements that enhance employee creativity (Oldham & Cummings, 1996; Robinson & Stern, 1997). But how does this creative process work for training and organization development professionals who are designing HRD interventions? Several writers have been exploring the element of creativity in instructional design. Nelson (1994) discusses being undisciplined and out of control as enhancing creativity. Rowland & Wilson (1994) offer possibilities as to how designers can balance seemingly paradoxical issues to make decisions regarding the design.

Outside of the design discipline, much has been written on the creative process in general. While the various processes involved in creation are complex and interfused, researchers have been documenting generic stages of the process since the 1920's (Wallas, 1926). Wallas' stages, which have served as a framework for understanding the creative process, include: (1) preparation, where the person does both formal and informal work by studying, thinking, searching for answers; (2) incubation, when the process rests and the unconscious mind takes over in order to organize, synthesize and transform ideas; (3) inspiration, which brings the process to a climax when everything falls into place with a Eureka; and (4) verification, measuring the product to both internal and external criteria.

How are the design and creative processes interrelated? Where is creativity used during the process of designing HRD interventions? Can the lessons from one discipline (creativity) inform and enhance the other (design)? The purpose of this research is to explore the creativity styles/preferences of HRD practitioners and to examine the creative elements of the design process.

Research Questions

Do HRD practitioners engage in creative processes? What are the creative parts of the HRD intervention design process? What are similarities and differences in the creative practices of HRD practitioners? What are the relationships, if any, between types or levels of creativity, personality preferences, and HRD practitioners' descriptions of their design processes? How could this information be of use to HRD professionals, faculty, and researchers?

Methodology

A qualitative approach was used in this study due to the nature of the research questions. The researchers wanted to capture data on the perceptions and practices from the insider's perspective. Specifically, the collective case study approach was used, which involves multiple cases in order to shed light on a complex phenomenon or population (Stake, 1994), in this case the creative processes employed by HRD professionals while designing interventions.

Data Collection

The primary means of data collection was individual interviews. The first interview was comprised of a series of questions related to the creative processes involved in intervention design. The tone of the interview was informal because the researchers wanted the subjects to feel comfortable talking about their experiences. The second round of interviews included some specific questions, but also some activities, including a drawing task, a word association activity, and reaction to a specific situation in a case scenario.

In addition to the interviews, two instruments were administered to the subjects, the Myers-Briggs Type Indicator (MBTI) (Form G) and the Kirton Adaption Innovation Inventory (KAI)*. The MBTI is based on the work of Swiss psychotherapist Carl Jung (Myers, 1993) and reflects individual preferences for energy (Extraversion and Introversion), information gathering (Sensing and Intuition), decision making (Thinking and Feeling), and lifestyle (Judging and Perceiving). Each of these four dimensions is measured on a scale; sixteen unique personality types result from the combination of the four MBTI preference scales.

The KAI (Kirton, 1987) is a 33-item self-report inventory to measure cognitive style in creativity, problem solving, and decision making. Kirton (1976) theorized that there are two different styles of creativity, adaption and innovation, and developed the KAI, which locates the respondent on a continuum ranging between high adaption and high innovation, corresponding with low-high scores. Adaptors tend to use available procedures and approaches to problems, whereas innovators try to restructure problems and use less conventional approaches. Possible scores on the KAI range from 32 to 160, with a standard deviation of 16. Scores above 96 characterize innovators and scores below 96 characterize adaptors.

Subjects

The ten subjects in this study were selected by the researchers, from a pool of known local HRD professionals, because of their considerable experience in designing a variety of HRD interventions. The researchers did not attempt to categorize subjects as to perceived types or levels of creativity as part of the selection process. The subjects include four males and six females, and their years of HRD professional experience range from 7 to 19 with the average of 12.9. The subjects' prior and current work experience includes private, public, and non-profit across the following areas: health care, retail, pharmaceutical, service, manufacturing, banking, telecommunication, social services, and volunteer organizations/boards. Types of interventions with which the subjects have experience include: teambuilding, executive coaching, career development, training (technical and non-technical), management and leadership development, group facilitation, train the trainer, strategic planning, OD interventions, quality improvement, and conflict resolution.

Data Analysis

The twenty interviews were audiotaped and transcribed. The qualitative data analysis software, Non-numeric Unstructured Data Indexing Searching and Theorizing (NUD*IST 4) (Qualitative Solutions & research Pty. Ltd., 1997), was used to aid in the coding, indexing, and sorting process as themes, commonalities, and differences emerged from the data. Data analysis occurred simultaneously and sequentially using the constant comparative method (Lincoln & Guba, 1985). The researchers continuously reflected on the meaning of what was heard and the direction in which the research should go next, constantly comparing the data against themes and looking for data that both confirmed and disconfirmed interpretations. Several tactics for generating meaning were employed throughout the research, including: noting patterns, seeing plausibility, clustering, splitting variables, subsuming particulars into the general, noting relations between variables, and making conceptual/theoretical coherence (Miles & Huberman, 1994). In addition, in order to increase the validity and reliability of the data, the researchers checked for representativeness and researcher effects, triangulated the data by utilizing a variety of collection techniques, used extreme examples, and solicited feedback from informants.

Results

The results of the KAI and MBTI are displayed on Table 1.

Table 1. Relationship Between MBTI & KAI Scores

Subject	Myers-Briggs Type Indicator (MBTI) Personality Type	MBTI Creativity Dimensions	Kirton Adaption-Innovation Inventory (KAI)	
G	ESTJ	SJ	84	Adaptor
J	ESFJ	SJ	86	Adaptor
B	ISTJ	SJ	105	Innovator
F	ESFJ	SJ	105	Innovator
H	ENFJ	NJ	112	Innovator
A	ENFJ	NJ	115	Innovator
I	ENFJ	NJ	124	Innovator
E	INTP	NP	130	Innovator
C	ENTP	NP	134	Innovator
D	ENFP	NP	138	Innovator

The scores on the KAI ranged from 84 to 138, identifying two subjects as adaptors and eight as innovators. MBTI scores showed that the ten subjects represented seven different types. Creativity research using the MBTI has determined that two of the four dimensions are related to creativity -- the information-gathering preference (S-N) and the lifestyles preference (J-P). Intuition (N) and Perception (P) are shown to be related to higher levels of creativity (Myers & McCaulley, 1985). Pairing the information-gathering preference (S-N) and lifestyles preference (J-P) shows that four subjects have the SJ combination, three have the NJ combination, three have the NP combination, and none have the SP combination. Interestingly, the MBTI combinations correspond to the KAI results. Those with the SJ preferences have the lowest KAI scores (indicating adaption), those with the NJ preference have the middle KAI scores, and those with the NP preferences have the highest KAI scores (indicating innovation). This is consistent with other research involving the KAI and MBTI (Carne & Kirton, 1982; Gryskiewicz & Tullar, 1995) which found that preferences for N and P were associated with an innovative style.

The results of the qualitative data analysis reveal similarities and differences among the subject related to their creative processes. The similarities will be described in a model that the researchers derived from their data, while key differences will be subsequently discussed in relation to that model. The phases in the creative-design process that emerged from the data are: (1) Diagnosis, (2) Immersion, (3) Percolation, (4) Aha, and (5) Checking (DIPAC).

Phase 1: Diagnosis

What is the problem? What is the cause of the problem? What is the desired result? What are potential solutions? Who needs to be involved in gathering and analyzing this information? This phase involves understanding the problem/situation and expected outcome, as well as determining the cause and a potential intervention strategy or solution(s). All ten subjects described this phase as rational, logical, and collaborative, where they worked jointly with stakeholders to identify the business need and the expected outcome. One subject mentioned that this was basically an analytical phase of the process, but creativity was needed to figure out how to involve the right people in the data collection and decision-making. Much of the discussions across the subjects focused on digging below the surface of the original problem to find the root cause of the issue.

Subject D: "Instead of providing them with solutions, what I'm doing is asking a series of questions to really uncover what they think the problem is and to find out if that is actually the problem. I want to know what they think is the problem and what they see as the essential obstacles or perhaps what they've tried, what's worked, what hasn't. And through this questioning process I start formulating what might be done as an intervention and ideas about the depth of the intervention"

Subject I: "One thing I do right up front is identify very clearly the business needs that we are addressing with this and what the behavioral or the desired performance is going to look like afterwards, so we have some sort of measurement. Here's where we are today, we know that, here's what we want to achieve, here's why, and this is what this behavior should look like when we're done."

Phase 2: Immersion

How do I think about the design options in ways that help me make decisions? How do I explore all reasonable options? How do I tap into my own reserve of knowledge and experience? Who, what, and where are my resources for ideas? How do I gather information and conduct research? This phase involves generating ideas for the intervention and was commonly characterized by the subjects as creative, in contrast to the prior more rational diagnostic process. It involves gathering information, conducting research, and consciously playing with that information in ways that will lead to making decisions about "how" the intervention will take place. The subjects utilized many techniques to help them in this phase of the process, which included: reading; talking to others; researching on the Internet; going to personal files; recalling related past experiences; using display tools such as sticky notes and the computer; thinking about the intervention from the perspective of the learner; and looking around at everyday life events to look for resources and ideas. Many of the subjects mentioned visualization and mental imagery as an important part of the process.

Subject E: "If you don't immerse yourself in the topic and just kind of think about all of the things that you know, you miss out on so much. I make a mess. I clean off my desk, I'll write notes, I use my memory, the PC, e-mail notes, little stick-ums everywhere. I have folders on everything."

Subject J: "We'll just let it be free flowing and we'll brainstorm with yellow stickies from our own experience, from our knowledge, from the information we received at the intake, from a whole variety of sources. If we find that we need more information then we'll hone in on those particular areas and we'll do literature searches, we'll go to the Internet, we'll go to the library, journals, a whole variety of places to get additional information."

Phase 3: Percolation

How do I help the ideas grow and gel? What enhances the synthesis process? How important is it that I have a chance to get away from the data generated in the immersion phase? In contrast to the prior phase, this phase involves the subconscious. In this phase, subjects are purposefully tapping into their subconscious, knowing that the ideas are still there and not finalized, but letting the ideas rest. Terms used to describe this phase included: germinate and grow, let it stew, incubate, simmer, sleeping on it, stewing in my brain, putting it on the back burner.

Subject A: "I put it on the back burner and I'm still tending to it in some sense but it may not have my full attention at that point. You know what you're working on it and the brain is always going off in different directions. There are times when I just have to shut if off and go do something else…Your subconscious – I think it's nothing more than a bunch of experiences all tied up together and wreaking havoc back there."

Subject B: "The complementary activity (to immersion) is to just get completely away from that and do something that would seem on the surface to be totally unrelated, which is to go run, swim, sit in the sun, or do needlework. I find that some kinds of incubation activities are creative, like needlework or sewing. I love to sew

and it's not just to get my sewing out of the way, or knitting something, or do something physical. It gets my mind off of it."

Phase 4: Aha!

When does the breakthrough come? Where and how do the inspirational ideas emerge? This phase is where the illumination, the breakthrough, the insight happens! Most subjects described their breakthrough moments as coming out of the subconscious percolation phase. Furthermore, most of the insights occurred away from the formal work environment, such as when taking a walk, driving, or taking a shower. This "aha" moment was described as magical and mysterious, and subjects claimed it was accompanied with a surge of energy and focus. One subject explained how it sometimes happens when you are talking to someone and how it is difficult to continue the conversation when this insight on some other topic has just occurred.

Subject C: "When I'm at home, to relax, I do things like crossword puzzles and jigsaw puzzles. I think it relaxes me because it's kind of a Zen-y thing, like I have to think about this but I'm not really thinking about anything, but I'm thinking underneath it. It is often when I'm doing some of that unconscious processing that ideas pop up. I had one (aha) standing home one weekend ironing. It had been kind of tossing around in my head for several days and then it bubbled up. I feel that intuition is nothing more than just accessing data that you don't realize you're accessing."

Subject F: "It's usually not sitting at my desk. I lot of my ahas happen with I'm driving. If something has occurred to me I will write it on a piece of scrap paper and put it near the file."

Phase 5: Checking

How do I know if my idea will work? How do I validate or verify this insight that has just occurred to me? How do I decide if I will go ahead and incorporate this idea into the design? This phase involves determining if you will move forward and actually use the "aha." Subjects described a variety of ways to validate their ideas. Interestingly, most said that they trust their gut or their instinct. If the idea has come from the prior steps in the creative-design process, it seems to be right. Techniques mentioned by subjects included: checking their idea against their prior experiences, seeing if it will support the goals developed in the diagnosis phase, checking for content-relevance, talking to someone who has done similar interventions, running it by a trusted colleague, or getting feedback from someone who has an opposite style. After this first phase of confirmation, most subjects mentioned formalizing the ideas by writing them up and getting feedback from the client or stakeholders in the process. But in general, the subjects remarked that when an idea emerged from this process, there was usually an intuitive sense that the idea was right!

Subject G: "Usually I start calling someone I know who has done something that may be similar and try to bounce ideas off of them, so I use that network. It's pretty intuitive. I can't pin down how I decide except that I'm always focusing on the goals or the outcomes and as long as I keep that clearly in mind then I keep going back and testing, 'Is this going to meet the goal or not?'"

Subject H: "I usually run it by a few people in HRD in our company that may not necessarily be in my division. That's usually what I do, but to be quite honest, I trust my instincts a lot, probably more. I kind of know right after it has come out of the incubation period that it's probably the right thing to do and it's going to fly really well."

Summary

This five-phased model for the creative aspects of the HRD intervention design process is a collective description of the subjects' processes. While there were many consistencies in the general phases, there were individual differences within the phases. Each subject seems to have developed an effective, successful individualized process and has a sense of confidence, not panic, that ideas will pull together when needed. The subjects "trusted the process." Subject D recounted: "I've gotten comfortable with that sense that there will be that period of void -- there will be that period of blackness or blankness or whatever you call it, and that somehow in immersing myself in content and then trusting the creative process that I've come to know as my own creative process, it really will all make sense. Whenever I can take advantage of that incubation period I think it results in a much higher quality product." Subject H described it: "It always comes together but I don't know how. It can make your manager a little nervous at times. But I've always been able to somehow magically pull things together. And

scary as it is, sometimes it's the night before. I always have a large amount of faith that it will come to me. It's not a planned thing. If I sat down and said, 'OK, tomorrow I'm going to plan how to do this,' it would not fly because it happens very spontaneously with me. All of a sudden I'll get one idea and all of these things start spinning off of that."

Differences

While there were many similarities across the subjects' descriptions of their processes, which are captured in the aforementioned creative-design model, there were also some notable differences. For example, almost without exception, Subject D had a different perspective than the other nine subjects. The general difference was that the HRD interventions described by Subject D were those involving on-the-spot facilitation, where design decisions were made in the moment, based on what is happening with the group members. The other nine subjects described both training and facilitation-type interventions, but all of the interventions involved a considerable amount of pre-planning (even of their facilitation interventions). All of Subject D's design happened in real time. The only place where there were similarities between Subject D and the others was in the diagnostic phase of the process, when the situation was being assessed, prior to determining or planning the approach or strategy. While Subject D has MBTI preferences of ENFP and the highest KAI score of 138, it is not known whether this distinction from the others is due to personality or creativity differences, differences in job responsibilities, and/or philosophical differences.

Another difference that appeared in the data analysis was that three subjects, A, H, and I, continually talked about how their professional and personal lives were intertwined. Without specific solicitation from questions, these three described how the resources for their intervention ideas were "everywhere" and that insights gained for their personal development also contributed ideas for their work-related interventions. Furthermore, Subjects A and H talked about how it is often difficult to turn off the ideas, that they are constantly bombarded with thoughts that relate back to their work and they have to monitor themselves so that it does not get out of control. Subject H said, "It's scary at times, because I get where I can't stop. I realize that I need to constrain the number of things." Subject A said, "Now the worst part of it is that when I get an idea I can't let go of it. In some ways it's like I never stop. It's almost like a sick obsession after a while because you never stop thinking about what you could do with this or when could apply that. I've gone so far as to grab toys out of my kid's happy meal because I think somewhere this is going to give me an idea of something I can do." Interestingly, these three subjects all have the ENFJ preferences (NJ function) and cluster in the mid-segment of KAI scores, from 112-124.

Conclusions

The creative-design process (DIPAC) derived from this research can be related to a generic instructional system design (ISD) model (Analysis, Design, Development, Implementation, and Evaluation (ADDIE) and Block's consulting model. Phase 1 of the DIPAC model, Diagnosis, relates to the analysis phase of the ISD model and the first three phases of Block's (1981) consulting model: (1) entry and contracting, (2) data collection and diagnosis, and (3) feedback and the decision to act. Phases 2-5 of the DIPAC model, Immersion, Percolation, Aha, and Checking, refer to the design phase of the ISD model and the implementation phase of Block's model, where the actual design of the intervention is embedded. Basically, the DIPAC model elaborates on specific parts of the process. It provides detail on how ideas are generated and decisions are made in the pre-planning or the design of the intervention. The detailed creative-design model that emerged from this research is very similar to the phases in the Wallas (1926) creativity model, but the steps are focused more specifically on designing HRD interventions and include an extensive analysis process.

While there were clear similarities across subjects that led to the creation of the DIPAC model, there are individual differences between subjects within each of the phases, resulting in a personal creative-design process. Also, there were distinctions between design and decision making that occurs before the event (for action) and design and decision making that happens during the event (in action). This was evident in the disparate responses from Subject D. Also, although some results did not appear that might have been expected, such as clear distinctions between the activities of adaptors and innovators, a relationship was shown between the MBTI and the KAI scores, indicating that both instruments are measuring similar elements related to creativity. Also, the three subjects with the ENFJ preferences and the 112-124 KAI scores demonstrated a strong integration of work and personal life throughout the design process, indicating that some differences could be related to personality preferences and creativity styles.

Finally, the design and creative process seem to be very interrelated. The subjects in this research, all experienced, successful HRD professionals, have learned to develop their own individualized version of this creative-design process and to trust that this process will help them generate useful ideas.

Limitations

The research involved a small number of subjects and was based on self-report data of thought processes or activities that could not easily be observed. As with any interpretive research, unintentional bias or subjectivity of the researchers is possible in the selection of the subjects, data collection, and analysis. The subjects in this case were a convenience sample from a pool of experienced HRD practitioners known to the researchers. This research is preliminary and calls for further study, both qualitative and quantitative, to validate and further explore the results. Additional research is needed to follow through with the implementation of the design ideas, to evaluate the effectiveness of the design on meeting the original goals, and finding relationships between the creative process and a successful "product." Another limitation of this research is that it is mainly focused on pre-planning events, so much more could be revealed by studying design decisions made in-the-moment, and comparing the two processes. Yet another aspect of creativity not explored in this study is the effect of inhibited creativity on both the design and the end result. Furthermore, this research focused on experienced practitioners; it did not offer a comparison between novices and experts. Finally, there are those who would resist the creation of any model related to the creative process and would regard a creativity model as an oxymoron.

Contribution to HRD Field

There is a current interest in embedding the instructional design process within a performance improvement framework, where effecting organizational goals is paramount. Furthermore, there is much interest in the area of creativity; organizations are recognizing the importance of enhancing the creativity of their employees, and researchers in the instructional design areas are searching for ways to understand and describe the creative elements of this process. This research makes a contribution across these areas. The creative-design model proposed by this study includes a diagnostic phase which addresses the performance improvement perspective, highlighting the importance of clearly understanding the problem within the context of organizational goals and finding collaborative ways to determine the root cause and appropriate solutions. The model also shows where creativity is important in design – where design and creativity merge. Basically, the creative elements of the design process are when professionals are trying to figure out "how" the intervention will take place. By deriving a model from practice and drawing parallels to models of performance technology, instructional design, and creativity, the disciplines become more integrated and fluid.

Practitioners could use this model to reflect upon and compare with their current practice. Use of this model for practice encourages professionals to engage in the activities that foster creative insight. Faculty who teach in areas related to intervention design could offer the model along with other design models to raise awareness of the role of creativity in the design process. Researchers could work to validate and expand this model. Specific areas for further research include comparing designing-for-action and designing-in-action, comparing novice and expert creative practices and results, and looking for relationships between creative design practices and improved organizational outcomes. This model is just a starting point for further exploration and debate regarding creativity in designing HRD interventions.

Contradictory Practices: Critical Feminist Perspectives on HRD and Workplace Learning

Sharon L. Howell
The Pennsylvania State University

Vicki K. Carter
The Pennsylvania State University

Fred M. Schied
The Pennsylvania State University

This study addressed HRD practice through the perspective of critical feminist scholarship including an analysis of feminist sociology of work, ethnographies of women in the workplace, feminist pedagogical theory and practice, and critical adult education. Specifically, the study examined the experiences surrounding HRD and learning in the workplace at two organizations over a six-month period. This research is part of a larger on-going project seeking an in-depth understanding of the relationship between work and knowledge production.

Keywords: Feminist, Critical, Qualitative

The purpose of this study was to explore the contradictions among critical feminist theory, Human Resource Development (HRD), and the reality of women's experience in the workplace. We believe that what is missing from the HRD literature, with its excessive managerial focus, is the centrality of workers' experiences of HRD and learning in the workplace. In particular, not only women's experiences but the gendered nature of work has not been addressed in the literature. The theoretical and empirical feminist scholarship on the sociology of work has assisted us in the analysis of the contradictory nature of current perspectives on HRD and workplace education. Increasingly, critical educators have begun to examine how HRD functions as an instrument for shaping and controlling workers. Our study extends this examination into critical feminist thought.

Theoretical Framework

Our inquiry is grounded in critical feminist theory. Feminist theory is interested in inquiry focused on agency, power relations, shifting positionalities, voice, individual experience, and socially constructed knowledge (Acker, Barry, & Esseveld, 1996; Tisdell, 1995). Although feminist theory is often oriented around the dynamics of gender, it is inclusive of the interests of others who have been marginalized by race, class, sexual orientation, language, and the practices and politics of educational systems (Lather, 1991a). Despite the agenda of inclusiveness, feminist theory has been described as lacking wholeness, due in part to the dominance of relatively privileged white women scholars (hooks, 1989; Johnson-Bailey & Cervero, 1996). Critical educators, however, define their field as epitomizing the democratic ideal and accept responsibility to work toward social justice and democracy (Briton, 1996; Cunningham, 1992; Kincheloe, 1999). Feminist theory and critical theory in education come together to disrupt the status quo in a myriad of learning environments by examining individual experiences as phenomena. Therefore, a critical feminist perspective considers issues of power as well as bringing out elements of affect, social justice, marginalization, and contextual links among both students' and instructors' social, political, historical, and cultural locations (Collins, 1990; Lather, 1991b; Lewis, 1990).

Research Design

Reflecting on our own experiences as workers and educators, we have found that the literature on work and learning, especially critical scholarly work, has helped us understand how the various dimensions of power operate in our own particular places of work (e.g., Butler, 1997; Graham, 1995; Hart, 1992, 1996; Hull, 1993; Luttrell, 1989; Stalker, 1996; Townley, 1994; Westwood, 1985). This critical reflection has also forced us to ask hard questions about the role education plays in the workplace. For example, who controls the goals, objectives, and definitions of learning and work, and for what purposes? Why does the assumption that workers personal objectives, visions, and points of view can and should be in alignment with management continue to go unquestioned? Is Human Resource Development imposed on workers for the purposes of organizational efficiency, productivity, and maximization of

profit ethical? Can the instrumental goals of training, the ongoing hierarchies of work, and the sustained balance of power relations in the workplace really be aligned with a feminist perspective? Based on these questions, we chose a qualitative approach for our inquiry because, in part, as McClure and Lopata (1996) stated: "Qualitative techniques are especially appropriate for use in situations where the research problem and the research setting are not well understood . . . When it is not clear what questions should be asked or what should be measured, a qualitative approach will be more useful." (p.11). Marshall and Rossman (1995) also link qualitative methods and studies of an exploratory and descriptive nature, particularly in cases of "contemporary" research, where phenomena are unfolding at the time of the study. Critical ethnography is a " . . . reflective process with a political purpose asking what could be, not just what is . . . seek[ing] to empower the subjects, not speaking for the subjects, but rather speaking 'to' and 'on behalf of' the subjects (Thomas, 1993, p. 4).

Following the work of Bartunek and Louis (1996), we designed this study as an insider/outsider team research project. Epistemologically grounded in the assumption that knowledge is a human construct and thus located in an interpretive paradigm, the basis of "insider inquiry" is that researchers are participants in the situation being studied and that how insiders and outsiders work together is of major importance. In particular, our research team is composed of people who differ in their physical and psychological connectedness to the research setting and focal questions being examined. The team assumes both responsibility and shared authority for the study, meeting weekly to discuss issues and analyze the data.

Our study was conducted at two sites. We followed the process for selecting key informants suggested by Patton (1990). At the first location, a manufacturing firm in northeastern United States, informants consisted of eight female hourly workers and the female training manager. The hourly workers' perspectives were those of women engaged in the production process. At the second site, also in the Northeast, two work units were examined by the study – one provided student services and the other instructional design services. This organization provided educational services including focuses on higher, continuing, informal, and professional education. One of the researchers worked at this site as a team leader and another as an instructional designer. Worker-informants included female clerical staff and professional staff. The two sites provided an excellent opportunity for an in-depth examination of key workplace learning issues across a broad spectrum of types of work and workers.

This ongoing study began with a research team of three female adult education doctoral students and a male adult education faculty member. All four of us had interests in, and experience with, workplace learning issues. At least one "insider" was employed in each of the two work sites where we conducted our research. For this specific study, the team consisted of three members all of whom work inside one of the two research sites. Having spent four years working together within a more or less traditional insider/outsider paradigm, we were comfortable with the processes and procedures we had worked out among the four-member team and, subsequently, a three-member team. However, as we considered what critical feminist perspectives on the workplace consisted of, the underlying structure and implications of the gendered nature of organizing our insider/outsider processes came to the surface. The two female members of the research team were "insiders" and the male participant was not, highlighting the complex issues of gender, voice, and power we were struggling to understand. Within our insider/outsider group of three, we now found ourselves confronting and opening for exploration the multi-layered aspects of the gendered nature of work at this micro-level as well as through the context of this study.

At the manufacturing facility, the research team began with observing activities on the shop floor and then conducting semi-structured interviews with hourly workers. The team observed and talked to workers about their jobs, their educational background, and the ramifications of workplace training initiatives. In addition to interviews with white, middle-aged, female workers averaging seventeen years on the job, as researchers we had complete access to workers on the shop floor, observing the manufacturing process and conducting informal interviews. Interviews were also conducted with the plant training manager, the site's "insider," who was keeping a reflective journal.

Now in its fourth year (Howell, Preston, Schied & Carter, 1996; Schied, Carter, Preston & Howell, 1997; Schied, Carter, Preston & Howell, 1998; Schied, Carter & Howell, forthcoming), this particular six-month critical ethnographic study was based upon reflective journals of the researchers, participant observation, and semi-structured interviews. We collaboratively designed the study including input from some of the participants, collected data, and interpreted results. Within a critical ethnographic paradigm, journal entries were examined, evaluated, and critiqued. Participation in formal HRD classes as well as informal and incidental learning activities were observed, field notes kept, and interviews recorded. Providing a rich database, journal entries became a means of writing as a way of knowing and a way of viewing HRD practice through interaction among researchers, written narrative, and the workplace as text (Fulwiler, 1987; Giroux, 1992; Kellner, 1989). Through participant observation and interviews, researchers had available on a daily basis, and in a social context, some of the reality-constituting interpretive practices through which women made meaning at work.

Collected data were coded and themes identified first by the workers and then the three-member research group. Subsequently themes were analyzed in order to identify, describe, and interpret data with the goal of uncovering patterns of significance and discussing them at a meta-theoretical level. During and following thematic coding, Erlandson, Harris, Skipper and Allen's (1993) four areas of trustworthiness for qualitative inquiry were addressed. 1) Credibility was established through comprehensive description and analysis of the workplace and the use of multiple techniques for collecting data. Triangulation occurred through multiple sources of data and peer reviews. 2) Transferability, or the applicability of findings to other contexts, became apparent in the commonalties among the other studies engaged through this research project and multiple work locations. 3) Dependability was provided through detailed description and reflection in journals, the coding scheme documentation, and descriptions of each analytic iteration. 4) Confirmability, the process of judging the findings of a study according to the focus of the research and not according to the biases of the researchers, was established through materials and data serving as repositories and traceable sources for the assertions made. Again, data coding schemes and journal reflections served as confirmable data repositories. Findings were integrated with existing critical feminist perspectives found in adult education, critical pedagogy, and sociology of work literature.

Contradictions with Existing HRD Theory and Practice

This study identified numerous areas of contradiction between a critical feminist perspective on work and learning and the practices of Human Resource Development. Because we cannot do justice to all the issues that emerged, we would like to discuss two of them in some detail and raise others, hoping to bring these unexamined perspectives forward for future discussion and research by workplace educators.

Women and Changing Organizational Hierarchies

At both sites we observed, as is the case in many workplaces, a flattening out of organizational hierarchies. In training terms this flattening out was described by educators at both research sites in positive terms as a way to bring decision-making opportunities to those who actually do the work thus giving them ownership in the processes of work. One way this was done was to have the women themselves do the training of new hires and fit that responsibility into their already full schedules. However, the women workers were much less positive about this development. The women pointed out that in practice this meant increased work and more responsibility without any real voice in what they thought was important. For example, one woman stated that:

> I think that right now they've [management] gotten themselves in a predicament where they need people and they don't have them . . . I don't think you should be running flat out at a job and trying to teach somebody how to do it also.

In fact in our observations, reflections, and interviews we saw a consistent theme of work intensification. Clerical staff at the second site, for instance, were asked to develop and deliver training in their area of expertise without any adjustment to their ongoing job responsibilities. Moreover, the staff had no illusions about how their jobs were changing. All this discussion of empowerment and letting workers engage in the decision making process meant more work but with no recourse to refuse or even question the additional tasks and assignments.

The feminist concept of voice becomes important at this point. In this environment the only acceptable voice is a cheerful, positive one. If a woman does not exhibit those kinds of attitudes and behaviors then she is seen as deficient as a team player, a non-cooperative individual, and an employee unwilling to take the additional responsibilities of increased worker decision making. These processes are, of course, defined by the organization and reinforced by Human Resource Development courses. Thus, after being told she had been enrolled in a transformational leadership class, one woman considered questioning the course's purpose and value but had second thoughts because " . . . again, still, and seemingly forever, I'm going to be seen as negative, cynical, skeptical, uncooperative and not a team player." Another worker who was told that she was not a team player and needed to work on becoming a 'cheerleader for management' commented sarcastically, " . . . guess I better break out the short skirt and pompoms."

As we were analyzing our data, several scenarios similar to those described above materialized. We began to connect these themes with feminist literature on work and learning. Specifically, organizational flattening is part of the argument asserting that our educational systems, despite data showing workers are more highly educated than at any other time (Cyert & Mowery, 1987, Munelly, 1987), are both the cause of and the solution to current economic issues (Shor, 1986). In particular, decision-making and continuous improvement processes located throughout this flatter organizational spectrum supposedly demand higher-skilled, better-educated workers even

though the design and organization of work indicates growing numbers of de-skilled jobs which do not draw upon or emphasize the requirement, or human capacity, to think and reason (Cyert & Mowery, 1987; Hart, 1996).

Mechthild Hart's (1996) critical feminist work in the field of adult education is one source of scholarship that discussed these issues. Hart described the disturbing aspects of the feminization of poverty, particularly in terms of its relationship with the sexist division of labor. The problem, according to much of the mainstream business and HRD literature (Handy, 1984; Rothwell, 1986; Shor, 1986) consists of a poorly educated workforce exacerbated by the entry of a higher percentage of women, minorities and immigrants into the workforce. One implication is that with a lower percentage of white men in the workplace there is a less than adequate base of human capital to apply to the current issues and needs of American business. The implication, and the ideology, of this position is clearly that non-male and non-White workers are less valuable and an across-the-board equating of women's work with low-skilled labor. Ironically, skills attributed to women as "natural" (patience, attention to detail, manual dexterity) such as work with microchips have now become viewed as higher-level skills, commonly compared to brain surgery, for which men are being retrained.

In addition, flatter organizations also have the effect of pushing more work to lower levels, levels where labor is cheaper and where the workforce becomes more polarized (Hart, 1996). Although some groups of women have found more highly-skilled work, many have been forced into lower-skilled minimum wage jobs. Gender, sexual orientation, age, class, and racial lines remain the points of polarization along with unequal distribution of skills, pay, and types of positions available (Hart, 1996; Schor, 1998). Our study suggests that Human Resource Development contributes to increasing the polarization through its deployment of generic skills in courses offered to workers. Examples of these types of courses include *Negaholics: How to Handle Negativity in the Workplace*, *Defining Your Role in a Changing Office Environment*, *Time Management: Regaining Control*, and *Thinking Power*. These classes, because they place the emphasis on the individual as deficient, help to create a docile, flexible, adjustable workforce that prepares workers to be resources rather than human beings. Furthermore, such classes devalue women's experience when they specifically describe women, particularly older women, as workers who resist change and insist upon maintaining and valuing their work-related experiences over generic skills, performance reviews, testing, and categorization of tasks. Modern work organizations devalue and attempt to discard workers' need for continuity, their rooting of work in life and personal experience, their sense of self, and a connection to others – all characteristics traditionally described as feminine. Employers often use training courses to help erase these characteristics. Moreover, training in new organizational structures, such as the flatter corporation with less-secure permanent positions and growing numbers of part-time jobs, helps to solidify worker expectations for low pay, poor work conditions, fewer benefits, increasing workloads, and lack of job security. According to Hart (1992), "the new workers will be 'working like women' whose 'flexible working patterns' have already made them into the preferred labor force in many instances" (p. 98-89). We saw a strong connection between our current research and what Handy (1984) noted 15 years ago: "It is ironic that just as women have begun to win their fight to lead the kinds of lives that men lead, those lives are beginning to shift towards the pattern from which women are escaping" (p. 162).

Our previous studies as well as this study exemplify some of these points. For example, at the manufacturing facility, testing, job re-evaluation, and training deployed via the Human Resource Development unit were used to further maximize profits by creating new job classifications that kept the mostly female workforce at near minimum wage levels. In another case, when the need for product dipped, senior workers, who had higher pay levels, were sent home while temporary workers, those with a lower hourly rate, continued on the job.

Disappearing Boundaries Among Work, Family, and Community

Morgan (1997) identified three types of interests that workers bring to the workplace. The intersection of *task interest*, one's job, *career interest*, visions of the future, *extramural interests*, commitments, values, beliefs from outside work, can be illustrated with three overlapping circles. There is constant tension among the three as individuals try to balance these intersecting areas of their lives. One way to understand this overlap and resulting tension is through the concept of a community of practice, " . . . a set of relations among persons, activity, and world, over time and in relation with other tangential communities of practice" (Lave & Wenger, 1991, p. 98). Given the multiple and overlapping communities of practice to which every individual belongs, Darrah (1996) questions where the boundaries of one ends and another starts. Within the discourse of the changing workplace, there is a blurring of the boundaries between Morgan's (1997) *task*, *career* and *extramural interests*. Kofman and Senge (1993), among others, discuss the concept of "communities of commitment," commitment where there is no hard line drawn between work and life outside of work. For example, two women juggling demanding full-time jobs and the raising of young children discussed the conflict they felt between the commitment to their jobs within a

collaborative work team environment and the second job awaiting them at home each night. They commented that there was often more comfort and support within the work environment than they found at home, where they began their second full-time job at the end of the day, often stressed and always tired. Research conducted by Hochschild (1997) indicates that these are not unusual tensions, with parents often voluntarily working longer hours on the job or taking work home, resulting in *task interest* consuming larger segments of time and commitment. However, "volunteering" to work longer hours can be caused by more than simply finding the work environment more supportive than the challenge of raising a family.

Schor (1992), in *The Overworked American*, provided data on the increased workloads being pushed on employees by employers in the United States. Over the past twenty years time spent on the job by the majority of workers at all levels steadily increased. However, since 1948 productivity of workers actually doubled. To have the same standard of living as in 1948 workers would only have to work a four-hour day. Leisure has become a casualty of the market economy with increased use of part-time and contract employment. As much as twenty percent of the workforce does not have enough work to make ends meet. At the same time, the work and spend cycle of the market economy causes increased levels of stress on the job. "Surprisingly, the high-powered jobs are not the most dangerous. The most stressful workplaces are the 'electronic sweatshops' and assembly lines where a demanding pace is coupled with virtually no individual discretion" (p.11).

Hamper (1986) described work on a General Motors assembly line where workers had figured out more efficient and faster ways to get their jobs done so that two people could actually share one job. This allowed the workers to alternate, one worker performing a more intensified multitasked job, allowing the other worker some release from the boredom of the assembly line. Now this type of worker-inspired job redesign falls under the continuous quality improvement expected of all workers. Instead of the increased efficiencies providing relief for workers, work is instead intensified. Both workers must now perform furiously all day instead of only half a day. While not all researchers agree that Americans are working longer (e.g., Robinson & Godbey, 1997), a new study just released by the Families and Work Institute about the increasingly intertwined nature of work and family, and the resulting increase in stress, links these issues to a workplace that requires more autonomy, demands continual learning, and provides less security (Bond, Galinsky & Swanberg, 1998).

Senge (1990) and Watkins and Marsick (1993), address these boundary issues only in a tangential way. In theory the learning organization, the ideal organization under the new capitalism, combines personal and work-related development. The learning organization is described as "family friendly", recognizing that productivity in the workplace relates to issues of family and community responsibility. Managers in learning organizations seek collaborative solutions to conflicts between family and work-related responsibilities. Flexible schedules, working at home, and the handling of family emergencies all test the skills of managers and are described as 'problems' to be managed (Watkins and Marsick, 1993).

Organizations often have "family friendly" policies in place, but many times these benefits are not used (Gee, Hull & Lankshear, 1996). Champy (1995), an expert in reengineering, described a series of weeklong workshops held at a hotel by Arizona Public Service to develop strategies for dealing with cultural issues, the new workforce paradigm, diversity, and the integrated person.

> We're looking for what we call "breakthrough concepts" to come out of these sessions. The hundred people go to the hotel, stay there, and meet every day in a conference room. People are allowed to leave at night if they have a need. A tenet of our culture is to help people balance their work and personal lives, and we would be going against that if we didn't allow people to go home. But generally we like them to stay because the sessions often go until 10 p.m. The idea is to get everybody stimulated about the topic and working together (p. 99).

What do employees take from such a message? It is all right to use an organizations "family friendly" policies, but only if it does not interfere with work? The supposedly friendly culture claims to provide interpersonal skills development and a strong commitment to individual as well as workplace development. In actual practice, commitment in many organizations is non-existent. Senge (1990) does not attempt to create a framework to address these kinds of issues, leaving it up to the individual to determine the balance between work and family based on individual vision and goals, along with a willingness to accept the consequences. Watkins and Marsick (1993) recognize the issues involved, providing a framework to begin dealing with them. In both cases, these solutions appear to be mostly available to upper level management because it is these kinds of positions that are designed for flexibility.

Our two research sites provided cases in point. In the factory, workers had just been trained in continuous quality, the expectation of teamwork and cooperation, and the value of loyalty to the company. However, one

woman on second-shift was permitted to see her daughter - dressed and on her way to her high school prom - only during her regularly scheduled break time and in the factory cafeteria. At the second site, clerical workers discussed at length the work they now were required to do that had previously been done by professional staff and/or managers. Their additional duties were assigned without benefit of increased pay or even management's acknowledgement of their new responsibilities.

Conclusions

We believe that our study raises some compelling concerns for those involved in HRD and workplace learning. We concur with others who have found the underlying concepts of HRD to be inherently anti-feminist and possibly anti-democratic (e.g., Butler, 1997; Calas & Smircich, 1993; Fenwick, 1998a, 1998b; Fletcher, 1994; Graham, 1995; Townley, 1994; Westwood, 1985). Feminist theory and feminist pedagogies are antithetical to a practice that locates people within economic systems that see humans as resources. Thus attempting to place feminism in the context of HRD fails to address the fundamental challenges feminist scholarship poses to discursive practices located within a human capital approach to knowledge production. Moreover, the rich ethnographies of women in the workplace reveal that many of the assumptions mainstream education, training and development hold about why women work and how women work in the office or on the shop floor are flawed. The very notion of who defines what productive work is, as well as how that work is rewarded, becomes central to any understanding of work and the role of knowledge production. Failure to tap into this research leaves human resource professionals and educators with an incomplete understanding of the relationship between work, gender, and knowledge production. Potentially this failure may also lead to designing workplace learning programs that have the unintended outcome of becoming oppressive systems, hidden in the rhetoric of so-called worker empowerment.

Self and Team Development in Practice (STP) Walk Rally

Chiraprapha Tan Akaraborworn
University of Minnesota

Gary N. McLean
University of Minnesota

An evaluation study was conducted to assess strengths and weaknesses of an outdoor-based experiential training (OBET) program used in Thailand. Self and Team Development in Practice (STP) Walk Rally is used as the case. Most of the principles in adult theory, experiential learning theory, and Holton's HRD Evaluation Research and Measurement Model are met by the STP Walk Rally, but it cannot promise transfer of learning. In the Thai culture, "Sanuk," or having fun, is the best element of the training design. However, face-to-face feedback is not appropriate for Thais. Recommendations for practice and research are made.

Keywords: Team Building, Adventure Learning, Thailand HRD

Self and Team Development in Practice (STP) is a variant of Outdoor-Based Experiential Training (OBET) that uses experiential learning as a technique for delivering training content such as team building, leadership, and communication. STP Walk Rally was developed for Thai employees in 1990 by Teerasak Kambannarak, Suwadee Homchanchur, and staff members from Thai Yamasaki. Since 1990, STP Walk Rally has provided services for more than 200 companies in Thailand.

Problem Statement

STP Walk Rally and other Thai OBETs have gained popularity over the last decade, especially for team building. OBET is often misused because (a) documentation in the area is based on personal accounts rather than systematic studies; (b) there is a paucity of research in Thailand in this field; and (c) there is an absence of evaluation of outdoor development programs in Thailand. The effectiveness of STP Walk Rally and other Thai OBETs has been questioned by those who believe it is just for fun since the activities look like childish games. Even though many studies have been done in the U.S. and Europe regarding these issues, they have not shown clear results. In many cases, the research designs were weak and threatened the validity of the research.

Without research on STP Walk Rally, it is hard to credit it with success. Thus, STP Walk Rally will be investigated to determine its strengths and weaknesses. There are many theories and models that could be used, but only adult learning theory, experiential learning theory, and Holton's (1996) HRD Evaluation Research and Measurement Model were selected to evaluate this particular training program.

Research Question

What are the STP Walk Rally's strengths and weaknesses in the Thai context based on adult learning theory, experiential learning theory, and Holton's (1996) HRD Evaluation Research and Measurement Model?

Outdoor-Based Experiential Training

OBET is a training process that uses experiential learning methods to deliver training content. There are three types of general OBET programs: challenge courses, group initiatives, and wilderness travel activities. The differences between general OBET and the STP Walk Rally as used in Thailand will be described in this section.

Kolb (1993) described challenge courses or high ropes courses as consisting of a series of activities conducted in trees or on poles. The objectives of these courses are to develop self-confidence, to help individuals

Copyright © 1999 Chiraprapha Tan Akaraborworn & Gary N. McLean

confront fears and to increase their propensity for risk taking. Group initiatives, or low ropes courses (Baldwin, Wagner, & Roland, 1991), consist of a series of group problem-solving activities. Baldwin et al. (1991) indicated that low ropes courses create changes in group climate but do not change self-concept. The third type, wilderness-based activities, is presented as a multi-day expedition. The objectives of wilderness programs are team building, communication, trust, and group cohesion.

Most of the activities in Thai OBET are a combination of low ropes and wilderness-based activities, not high ropes activities. The expected results from OBET are team building, communication, problem solving, and group cohesion, rather than self-development. STP Walk Rally was originally used for team building only. Later, the program was applied to new employee orientation, improving job satisfaction, and improving participants' skills in areas such as leadership, management, and decision making. These objectives are different from most U.S. OBETs' objectives. In the U.S., OBET is often used for individual development and to increase self-esteem (Wagner, Baldwin, & Roland, 1991).

OBET has many other names. In this article, OBET will be used to represent any outdoor-based experiential training. "Walk Rally" is the most popular word for OBET in Thailand. In this article, STP Walk Rally will be used to refer to the specific STP program, while OBET will be used to refer to the general training approach.

OBET programs vary substantially from trainer to trainer. Ibbetson (1993) stated that the essence of OBET is to use simulated outdoor initiative activities as direct metaphors for many everyday occurrences. In this paper, OBET means a process that uses hands-on challenges or adventures, usually in the outdoors, combined with review and feedback, to improve workplace performance.

STP Walk Rally

STP Walk Rally is an experiential training program intended to enable trainees to have insights through learning by doing. Kijyanyong (1997) defined "Walk Rally" as an activity that provides trainees with self-experience and self-learning under competitive situations. STP Walk Rally is adapted from European Orienteering, Group Dynamics, and Japanese Walk Rally.

Orienteering

"Orienteering is land navigation by the use of a topographical map and compass" (NAGWS, 1976, p. 162). In STP Walk Rally, maps are used to direct the walk. To win the rally, participants have to work in teams. They are expected to help each other by reading the map and controlling the time. Teams have to get to checkpoints at a specific time.

Group Dynamics

Group Dynamics is the study of the interrelationships between participants of a group, how the group is formed, and how it reacts to other groups. Mathes (1968) stated that group dynamics describes what is happening in all groups at all times whether or not the participants recognize it. In STP Walk Rally, participants' behaviors are videotaped and are observed by facilitators. The tapes are played back to the participants. The participants are then encouraged to give feedback on their feelings and the changes that they have seen during the course.

Japanese Walk Rally

Shigeru Kobayashi developed a teaching technique called Walk Rally in the 1960s. Japanese Walk Rally is an OBET program that enhances collaboration and team building. The participants are divided into teams of about 8 to 10 people. The participants on each team are paired and each pair works together to obtain a score. The pairs' scores are added to get the team's total score. The team that has the highest score wins. This same system is used in the Thai STP Walk Rally.

STP Walk Rally's Characteristics

The main objectives of STP Walk Rally are to have participants learn through experiential learning activities how to develop themselves, as well as how to understand other people in order to work together. These

objectives are similar to the T-Group objectives that focus on learning about self and others (Rothwell, Sullivan, & McLean, 1995).

Each STP Walk Rally session consists of 40 to 50 participants. The participants should represent a variety of ages, genders, functions, and positions within a company. The program takes three days, including one day of traveling because the program is held at a remote site. However, STP Walk Rally can be tailored to meet the needs of different organizations or groups. STP Walk Rally can be divided into two phases: classroom training that prepares the participants to work in teams and experiential activities with participant involvement.

Phase I. In the half-day classroom-training phase, an instructor presents information about team building. Participants work in teams to set goals and objectives for their teams. Trainers use ice-breakers, games, psychological tests, and indoor experiential learning activities as alternative facilitation methods.

Phase II. Th experiential phase lasts one-and-a-half days. In this session, STP Walk Rally serves as a vehicle for practicing skills learned during Phase I. There are two rounds of walks. Before the first round, each team receives a map, time sheet, and set of rules. On the map are hints written in poems to lead the team from one checkpoint to the next. The team members decide which direction they should go. At each checkpoint, all team members have to report to a Walk Rally facilitator. They are presented with a challenge. Each team has to complete the challenge before they proceed to the next point. The participants' behaviors are videotaped. At the end of the walk, participants are given an hour to reflect on what they have learned. This is followed by a debrief session with STP facilitators. The winning team is announced and presented with a trophy.

The second round of the Walk Rally starts on the last day. Participants remain in the same teams. The second round is similar to the first round, but it has different activities and checkpoints. The challenges are more complicated. At the end of this session, debriefing is again provided. Participants are given time for self-reflection. They exchange feedback in person with their team members, thanking them and telling them what they would like them to improve in the future. From personal experience, most of the feedback is positive. There are two trophies for the second round, one for the winning team and one for the most-improved team.

STP Walk Rally Evaluation

Since no research has been done on STP Walk Rally, it is difficult to assess whether or not the program can bring about change in participants and their organizations. Adult learning theory, experiential learning theory, and Holton's (1996) HRD Evaluation Model are used to evaluate STP Walk Rally.

Adult Learning

Cross (1982) stated that people working in adult learning situations should apply four fundamental principles.

1. Present new information only if it is meaningful and practical.
2. Present only one idea or concept at a time--to help adults integrate it with their existing knowledge.
3. Present information in a manner that permits mastery. Adults maintain the ability to learn throughout their lifetime.
4. Use feedback and frequent summarization to facilitate and foster retention and recall.
5.

Applying Cross's first principle, throughout the course, information is presented at an appropriate time. Participants might not understand what is going on while experiencing the activities. Trainers help participants search for answers by themselves. However, the activities in STP Walk Rally are contrived and artificial. As none of the activities in STP Walk Rally occur in real life, the feedback received may not be very meaningful.

As to the second principle, in the debriefing sessions, the participants are asked to integrate what they have learned and how they can use their learning in the workplace. Contrary to the principle, many ideas are presented at a time in the debriefings. Participants might be confused by trainers' references.

For the third principle, experiential training encourages participants to learn at their own pace. Participants of different ages are able to take this course at the same time. However, competition in the STP Walk Rally is contrary to this principle as mastery allows everyone to succeed. Becker (1998) stated that the downside of using games in training is that games tend to spotlight inequalities among participants' verbal skills, physical coordination, or intellectual prowess. "They create winners and losers, and the losers remember it" (p. 79).

For the last principle, videotaping can be a great tool for giving feedback. It has recorded the actual reactions of the participants that might differ from their recollections of the activities. However, the feedback is not provided frequently. There are only two debriefings during the three-day training.

Experiential Learning

Kolb and Fry (1975) presented an experiential learning cycle. The cycle includes (a) concrete experience, (b) observation and reflections, (c) formalization of abstract concepts and generalizations, and (d) testing implications of concepts in new situations. This cycle is continuous because the last step, involving the application of learned concepts, leads to new concrete experiences and the beginning of another cycle.

STP Walk Rally uses the experiential learning cycle for designing the activities in Phase II. This cycle includes (a) having the experiences on the first-round walk; (b) observing and reflecting on the experiences through the videotape and comments by staff and participants; (c) debriefing or analyzing the experience by discussing thoughts and feelings about the relationship of the experience to real life; and (d) applying the results of the analyses to the second-round walk. The two-round walks, videotape reflection, and debriefing make the STP Walk Rally a complete variant of the experiential learning cycle. However, some companies ask for one-round of the walk only, which is contrary to the continuous cycle concept.

It is clear that experiential learning is a participatory approach to training in which learners do things rather than sit and listen to a lecture. Bruner (1996) stated that some things are learned best by actually doing them. Much research has been done comparing the effectiveness of experiential training with that of traditional classroom training. Lumlert (1994) conducted research on the efficiency of Walk Rally training in the Electricity Generating Authority of Thailand. According to her research, Walk Rally training improved trainees' decision making, self-control, and planning skills, while traditional classroom training improved only decision making. However, this research did not conduct pre-test assessment.

Hayward suggested that using a combination of outdoor courses with some classroom training works best (in Fryberger, 1995). Lee and Caffarella (1994) claimed that in-class activities can facilitate the synthesis between background knowledge and new knowledge to the extent that the activities encourage active reflection or problem solving, especially if they are highly interactive. STP Walk Rally has a combination of classroom training and outdoor activities.

Dewey (1929) argued that "it is wrong to see experience as the easy way to learn" (p. 6). However, in experiential learning learners experience real feelings and emotions (Clements, Wagner, & Roland, 1995). STP Walk Rally activities require trainees to commit themselves to team success. With no role-playing, there is no place to hide from one's feelings (Fryberger, 1995). Yet none of these activities occurs in the workplace.

Holton's HRD Measurement Model

Holton's (1996) measurement model is a contemporary evaluation model that has only three outcome measures: learning, individual performance, and organizational results. The first outcome, *learning*, is influenced by trainee reaction, motivation to learn, and ability.

1. *Trainee reaction* plays a critical role in STP Walk Rally. Adams (1997) cited much research about adult play from anthropology, psychology, and education that indicates that play is an important mediator for learning and socialization throughout life. "One way to actively engage learners is to use play in training and development programs" (p. 881). Many groups of participants prefer playing games to sitting for lectures.

Thai people want "sanuk" (play) through games and experiential activities instead of boring traditional classroom training. Komin's (1990) study in Thailand found that fun-pleasure values function as the imperative mechanism as a means to support and maintain more important interpersonal interaction values. Fun is a part of the STP Walk Rally program. However, fun cannot guarantee that participants will learn more. In addition, it is not easy to involve every trainee in playing every activity.

2. *Motivation to learn*, according to Holton (1996), has a direct relationship with learning. The four variables that influence the degree of motivation are readiness for the intervention, job attitudes, personal characteristics, and motivation to transfer learning. Motivation to transfer will be discussed in the performance outcomes section. One way to improve the intervention readiness for STP Walk Rally is to present the list of things that participants should prepare before attending the course. For example, the trainees should bring comfortable clothes and shoes and have a medical examination.

Job attitude and personal characteristics are independent variables that can affect training success. If the trainees have positive job attitudes, it is likely that they will be more motivated to learn and will have better training

outcomes. Personal characteristics, such as self-efficacy, locus of control, and need achievement, have been shown to influence motivation to learn. On the other hand, there is much research on OBET that has attempted to measure without much success these three characteristics as training outcomes (Kolb, 1993; Parker, 1992; Robitscheck, 1993; Taragos, 1993). Without a pre-test, no one can assume that these three characteristics are training outcomes.

3. *Ability* has a direct impact on learning. Holton (1996) noted that heterogeneity in groups' cognitive abilities tends to influence positively training outcomes. Recognition of this is built into the structure of the STP Walk Rally groups as well. The participants normally come from different departments in a company.

The second outcome, *individual performance*, is influenced by motivation to transfer, transfer climate, and transfer design. *Transfer motivation* falls into four categories: intervention fulfillment, learning outcomes, job attitudes, and expected utility. Expected utility will be discussed in the organizational results section.

Intervention fulfillment and job attitudes are independent factors that are beyond the control of training management, but they are considered to be influences on performance outcome. *Transfer climate* and *transfer design* are met by debriefing in STP Walk Rally which helps participants yo apply what they have learned in the workplace. However, in the Thai culture, debriefing, which includes criticizing participants in front of each other, is difficult for Thais. "Face-saving" and "kreng jai" or "ego preserving" are key criteria in relationships. As a result, straightforward negative performance feedback, strong criticism, and face-to-face confrontation techniques must be avoided (Komin, 1990). Becker (1998) presented two incidents in which people who lose face experience significant consequences, leading to decreased learning and withdrawal, antagonism, and sabotage.

The third outcome, influences on *organizational results*, is linked to organizational goals, expected utility or payoff, and external factors. STP Walk Rally has both strengths and weaknesses in this area.

1. Linkage to *organizational goals* can be done from the beginning. Front-end analysis must begin with organizational analysis to identify the highest priority opportunities for performance improvement (Swanson, 1994). STP Walk Rally provides both interviews and questionnaires for the client as a form of training needs assessment. However, the organizational analysis is not required for every company. Further, a comprehensive analysis might well lead to interventions other than STP Walk Rally.

2. *Expected utility or payoff measure* is recommended to determine whether or not the OBET program is a warranted investment of resources. Swanson and Gradous (1988) suggested that financial benefits should be forecasted before the intervention begins. The result of the STP Walk Rally could be measured in terms of financial benefits, but this has not been done. Reduction in absenteeism and employee turnover and improvement in productivity can be calculated as financial benefits. Also, the psychological benefit or quality of work life during and after training should be considered as a return of investment (ROI). Ewert (1989) agreed that the goal of OBET is not only to improve an individual's physical performance but also to enhance the person's cognitive, attitudinal, and behavioral skills to achieve lifelong physical and emotional well-being. Currently, organizations in Thailand consider encouraging employees to become "khon-kheng khon-dee," intellectual and moral persons (Kampu-Na-Ayuthaya, Na-Chiangmai, & Thongwiwat, 1993).

3. As *external factors* outside the realm of training can affect the organizational results, they need to be identified and controlled for in the design.

Recommendations for Practice

Designing experiential training is not an easy task. The following are some recommendations for future development of STP Walk Rally in Thailand.

- Because of kreng-jai (ego-preserving) and face-saving, participants may be more comfortable in giving feedback by writing a diary to reflect on their thoughts and feelings and by providing written feedback.
- STP Walk Rally seems to lack mechanisms for shaping the participants' future. Using scenarios is recommended. A scenario is "a tool for ordering one's perceptions about the future environments in which decisions might be played out" (Schwartz, 1996). Participants should have opportunities to think about how they can transfer what they learn to the workplace.
- The course should not be the same every time because each client company has different needs and culture. The program should be tailored for the individual client. Also, the activities should be altered to meet specific objectives. Organizational analysis is a must.
- The trainer should play a key role in developing both individuals and the organization. Rothwell et al. (1995) recommended that the trainer's role be broadened to include consulting with participant organizations to ensure organizational support for improved performance after training. Otherwise, the performance cannot be maintained for very long.

- Evaluation is needed for improvement of the program. To determine the impact of the participants' characteristics on experiential learning, pre- and post-test evaluation should be provided to measure the real training effect. To protect against post-test euphoria, the post-test should not be conducted right after the training. STP Walk Rally to date has used only post-test evaluation.
- At least two rounds of the STP Walk Rally should be run each time. Trainers should refuse to run one-day sessions.

Recommendations for Research

There is a paucity of research in Thailand in this field. Both qualitative and quantitative research studies are recommended. Miner (1993) found different results from qualitative and quantitative methods on team building through experience-based training. Nonparticipant observation and other qualitative methods suggested that training had a strong impact on participants and on the company. However, quantitative research found that the training did not result in significant differences. In contrast, Reina (1995) found that both quantitative and qualitative results partially supported the hypothesis that physical touch in the context of adventure training within work teams significantly and positively impacted trust. Thus, both research paradigms are necessary and useful.

An experimental research design is highly recommended to include both pre- and post-tests. Most research on OBET uses only a pre-test. Moreover, follow-up tests should be provided to confirm learning outcomes and to protect against post-test euphoria. Ibbetson (1995) provided evidence that a team development intervention had an immediate, short-term, positive effect on the group as a whole but had no long-term effect. Wagner and Roland (1992) noted that programs with long duration would allow a better comparison.

Conclusion

STP Walk Rally seems to have both strengths and weaknesses based on adult learning theory, experiential learning theory, and Holton's HRD evaluation and measurement model.

The STP Walk Rally's strengths are (a) activity design that encourages participants to learn at their own pace; (b) learning cycle that (usually) completes the experiential learning cycle; (c) a learning setting that combines an outdoor course with classroom training; and (d) fun during the training that creates a better learning environment. However, fun cannot guarantee that participants learn.

Weaknesses in the STP Walk Rally are (a) STP activities that do not occur in real life; (b) competition that creates winners and losers; (c) time consuming; and (d) debriefing that criticizes in front of others. In Thai culture, face-saving and "kreng jai" are common attributes that cannot be ignored during the debriefing.

Without needed research on STP Walk Rally, it is difficult to credit it with success. Before such an analysis takes place, the basic design of STP Walk Rally needs to be modified based upon this analysis so that it more closely matches what is already known through theory.

Human Resource Development's Contribution to Strategic Service Quality Performance in Radisson Hotels Worldwide

Richard A. Swanson

University of Minnesota

Susan Geurs
Radisson Hotels Worldwide

This partnership study between the University of Minnesota and Radisson Hotels Worldwide illustrates the strategic alignment and contribution of HRD to service quality. In this case study twenty-nine Radisson Hotels Worldwide tested a service guarantee performance improvement program that included a primary HRD component throughout. In just three months, many of Radisson's service quality performance measures in these hotels improved significantly.

Keywords: Service Quality, Hotel Industry

Human Resource Development (HRD) has been defined "... as a process for developing and unleashing human expertise through organization development and personnel training and development for the purpose of improving performance at the organization, work process, group, and individual levels." (Swanson & Holton, 1999). In addition, HRD is thought to have three potential strategic roles (Torraco & Swanson, 1995).

- HRD being Performanced-Based
- HRD having Strategic Capability
- HRD contributing to Emergent Strategy

The strategic performance challenge to HRD is its connection to the existing or emerging strategy of an organization. This case study reports the strategic connection and contribution of HRD to service quality performance in a major hotel chain. The central idea was to (1) explore the concept of a service guarantee and to establish such a guarantee for customers and (2) to prepare managers and staff with the organizational service learning (knowledge and expertise) required to implementing the strategic initiative.

The paper begins with a description of the theoretical framework of service guarantees followed by the case study framework and problem statement. The next section presents the methodology of the study followed by the results and conclusions.

The Service Guarantees Concept

Hart (1988, 1993), Hill (1995) and others (Haskett, et.al.) have argued persuasively that service guarantees can help many firms to position themselves in the market by clearly defining their value proposition to customers and employees. Service guarantees also "stress" front-line workers to deliver high-quality service the first time, encourage customers to voice their complaints to the firm, and motivate and enable workers to quickly discover and recover dissatisfied customers.

Hays and Hill (in-press) developed a model (Figure 1) to show how service guarantees affect service quality and, ultimately, business performance. In this model, they argue that a strong service guarantee improves customer satisfaction, service quality, and customer loyalty (SQL) through three intervening variables: Marketing Communications Impact, Employee Motivation and Vision, and Organizational Service Learning. These are defined in the following paragraphs.

© Copyright 1999 Richard A. Swanson

Marketing Communications Impact

(MCI) –A strong service guarantee is intended to have both offensive and defensive marketing impact. Offensively, firms can use a service guarantee to proclaim the reliability of their high quality service and thus attract new customers. Defensively, a service guarantee not only enables companies to recover unsatisfied customers but also encourages dissatisfied customers to complain, thus allowing the firm to recover those customers.

Employee Motivation and Vision (EMV)

A strong service guarantee was intended to motivate employees to fulfill the guarantee and to satisfy customers. The guarantee clearly defines the employee's job as satisfying customers – not just taking reservations, checking out customers, or cleaning rooms. It can also inspire a new vision for service quality when employees are challenged to really satisfy customers' true needs.

Organizational Service Learning

(OSL) – A strong service guarantee can help organizations discover dissatisfied customers and learn from them in order to improve service quality. Organizations with a strong service guarantee will tend learn how to satisfy customers faster than organizations without one.

When marketing communications impact (MCI), employee motivation and vision (EMV), and organizational service learning (OSL) are improved, then service quality, customer satisfaction, and customer loyalty (SQL) should also improve. Business performance (BP) will improve as a result of improved SQL.

Case Study Framework and Problem Statement

Carlson Companies, Inc. is one of America's largest privately owned corporations with total system sales of $13.4 billion in 1996 and $20 billion in 1997. Carlson Companies employs about 130,000 people worldwide, including those who work in franchised and managed operations.

Radisson Hotels Worldwide and its parent, Carlson Hospitality Worldwide, include more than 500 lodging locations in 49 countries. Under the leadership of its former president, Radisson's strategy focused on growth and the firm added hotels at the rate of about one hotel every seven days. By 1997, Radisson's "growth at any cost" strategy left Radisson with a significant diversity in hotel quality and an "unfocused" brand image. Alignment with hotel owners (more than hotel guests) also seemed to cause Radisson's customer service and hotel management expertise to atrophy.

In 1997 and 1998, Radisoon took several initiatives to drive the organization towards becoming a more customer-focused brand. In their words, they "re-discovered that their primary customers should be the guests -- not

the owners." Some of these initiatives included a service guarantee human resource development program, a guest satisfaction measurement program, an employee satisfaction measurement program, and an information technology initiative. Radisson was committed to creating the systems and programs that would bring Radisson into the 21-st century as a "customer-driven learning organization." Their goal was to make Radisson the "most trusted and respected brand worldwide." They were hopeful that these initiatives would make a significant contribution to helping Radisson achieve these goals.

This paper focuses on the question of results from a service guarantee initiative having policy and HRD components, the strategic service quality performance metrics that support the implementation, and evaluation of that initiative, and a resulting measures of performance drivers.

The Service Guarantee Design

Hart's 1993 book prescribes an "unconditional satisfaction" guarantee where the firm responds to any and all service failures with some sort of immediate compensation. In focus groups conducted by Radisson, customers found it uncomfortable to receive a full refund for a minor complaint; giving away room-nights too freely actually discouraged customers from voicing their complaints. Radisson's management team decided that a more appropriate guarantee would be a two-step guarantee that allowed Radisson to "make it right" before the hotel offered the customer a full refund. Focus groups confirmed that this was a good balance between encouraging customers to voice their complaints and assuring customers that their complaints would be taken seriously.

In this case study twenty-nine Radisson Hotels Worldwide tested a service guarantee performance improvement program. The pilot hotels implemented the guarantee with a complete HRD program but with no publicity. The guarantee read simply:

If you aren't satisfied with something, please let us know and we'll make it right or you won't pay.

Service Quality Performance Metrics

Four service quality performance driver metrics were used in this case study (see Holton, 1999 and Swanson & Holton, 1999):

- *Willingness to return* -- percent of customers who indicate that they are willing to return.
- *Percent advocates* -- percent of customers who indicate a willingness to recommend Radisson Hotels to others.
- *Percent defectors* -- percent of customers who indicate that they are unwilling to return.
- *Percent complaints* -- ratio of complaints to room nights.

Information systems, under the leadership of Radisson's Vice President of Knowledge Resources produces a "dashboard" for each hotel that includes these as well as financial measures. The one-page dashboard is essentially a "balanced scorecard"[1] for each hotel. These measures are often supplemented with *ad hoc* marketing research.

HRD Contribution

HRD in the forms of employee training and involvement were key aspects of the service guarantee program at Radisson. A comprehensive training program, complete with training manuals and videotapes, was developed to support the guarantee program. Radisson managers and employees were required to participate in the training program before the hotel could implement the guarantee program. An involvement program before, during and after the training consisted of regular communication and employee input sessions.

The involvement included systematic and regular communication through management memos, employee newsletters, and face-to-face meetings as well as substantial opportunities to suggest changes and actually modify the program rollout strategies and supporting materials.

Training programs first involved the certification of 29 top managers to serve as trainers of key site personnel. The connection of managers-to-managers in the learning (and ultimate networking process) was essential is backing up the general concept with the knowledge and expertise required to execute the service guarantee. The training design was highly interactive and supporting materials in the forms of videotapes and simulations played important parts in supporting the managers-turn-trainers.

Methodology

In order to test the "100% Guest Satisfaction Program," Radisson selected twenty-nine hotels for a "pilot" test of the 100% Guest Satisfaction Program. These hotels represented a wide variety of hotel types, locations, and sizes.

The impact of the service guarantee was measured using three approaches: (1) Radisson's internal data from room comment cards to measure the service quality metrics discussed above, (2) a customer survey conducted by a market research firm, and (3) a University of Minnesota study of employee motivation.

A team of researchers from the University of Minnesota developed a survey instrument based on the EMV and OSL theory in Figure 1 and administered it to both managers and front-desk workers in each of the twenty-nine pilot hotels. Table 1 presents the items (questions) that made up the survey. The actual survey randomized the questions. Respondents were asked to score each item on a 7-point "agree-disagree" scale.

Of the twenty-nine hotels in the pilot study, four were excluded from the survey data analysis because they were not in the United States or Canada. Two additional hotels were excluded because service quality performance data were not available. With Radisson's help, the survey had a 100% high response rate for the twenty-four remaining hotels in the sample.

The researchers administered a survey to both management and front-desk hotel employees before and after the service guarantee policy and employee training was implemented in the test hotels. The survey found statistically significant correlation between a new service quality metric called "employee motivation and vision" (EMV) and Radisson's service quality performance metrics.

Results

The average change for each variable is also shown in Table 1. The "before" data was taken at the start of the program and approximately six months "after." Fourteen of the sixteen variables showed improvement. The improvements marked with an asterisk (*) had statistically significant improvement. Five of Employee Motivation and Vision (EMV) items showed significant improvement with the service guarantee program. Two of the OSL-Discovery variables improved significantly. However, none of the OSL-Data or OSL-Improvement items was statistically better. It may be possible that OSL variables lag EMV variables and, therefore, OSL improvements were not detected in the study.

Service Quality Performance Metrics

A study of Radisson's four service quality performance metrics found that the willingness to return increased, percent advocates increased, and percent defectors decreased; The percent complaints increased significantly during the first four months of the pilot program. Management concluded that the service guarantee encouraged dissatisfied customers to voice their complaints, and viewed this as a positive result.

A more sophisticated statistical analysis found a statistically significant relationship between the sum of the EMV scores, the sum of the OSL scores, and the percent advocates metric. In other words, customer satisfaction (measured by percent advocates) is strongly affected to employee motivation and vision (EMV) and the firm's ability to learn from its customers (OSL) as measured by the survey instrument.

Conclusions

While many scholars and practitioners might view a service guarantee program as only a marketing strategy, this study approached this performance improvement effort as a more fundamental system change. In this case the conclusion was that a service guarantee program that holistically thinks about customers, mission, policies, and the people that must ultimately understand and carry out the new approach can significantly shape the operations strategy of a firm as well. Radisson's service guarantee, *implemented with sound HRD theories and practices,* had a positive influence on the motivation and vision of employees, their knowledge and expertise, and increased service quality and customer satisfaction.

A service guarantee program can also provide the impetus for a firm to focus operations on the attainment of superior service quality through learning from service failures. In this case, the service guarantee and HRD's contribution were viewed as both strategic and a sound financial investment.

In just three months, many of Radisson's service quality performance measures in these hotels improved significantly. Customer satisfaction, measured by Radisson's own metrics and by a market research firm, showed increased "willingness to return" and "percent advocating the hotel." Radisson also found that the guarantee decreased employee turnover, increased utilization, and increased profitability for the hotels where service guarantee program was pilot tested

With respect to strategic performance measurement, this paper illustrates an interesting application of strategic quality measures. The paper also provides evidence that the survey instrument can be used as a service quality *performance driver metric* (see Swanson & Holton, 1999) to measure employee motivation and vision construct (EMV) and organizational service learning (OSL).

Table 1. Employee Survey Results

Construct	Question	Average improvement
EMV Motivation		
	1. Our employees always make customer satisfaction their top goal.	.121
	2. Our employees go out of their way to listen when customers complain.	.210*
	3. Our employees try very hard to fix customer problems when they know about them.	-.026
	4. Our employees feel a strong sense of accountability and ownership for service quality.	.236*
	5. Customer satisfaction is an extremely important part of my job.	.117*
EMV - Vision		
	1. Our service quality priorities are always clear to our employees.	.342*
	2. Our employees have a clear understanding of the role that service quality plays in helping our company compete in our market.	.107
	3. We have very well defined standards for service quality.	.269*
OSL - Discovery		
	1. When a service problem occurs, we are almost always aware of the problem.	.291*
	2. Our employees are very aware of customer complaints and why they occur.	-.006
	3. Customers with a service problem almost always complain to us.	.345*
OSL - Data		
	1. We have accurate information on how many complaints we receive.	.167
	2. We have accurate information on why our customers complain.	.076
	3. Information on customer satisfaction trends is communicated to all of our employees.	.212
OSL - Improvement		
	1. Collecting customer feedback helps us to regularly improve our service quality.	.064
	2. We have improved our service quality over the past year based on customer complaint information.	.009

** Statistically significant at the .10 level of significance.*

Mastering Turbulent Growth: A Growth Audit at a Major Pharmaceutical Research Center

Michael Leimbach,
Meredith Ceh
Wilson Learning Worldwide

The failure of organizational growth initiatives has been linked to the inability of organizations to adequately address the HRD implications of strategic growth. In this study we present a model for conceptualizing the nature of organizational growth and provide a case example of how this framework was applied as a diagnostic tool within a major pharmaceutical research center. Results showed that the model revealed and clarified the human resource implications of the organization's growth strategy. Further, the results of the case study validated outcomes anticipated by the model, specifically, growth pattern recognition and causal mapping of growth.

Keywords: HRD, Strategy, Audit

Radical, disruptive, and innovative growth is not just a compelling aspiration for organizations, it is a requirement. Increasing options available to stakeholders, decreasing switching costs, and heightened expectations of investors, customers, suppliers, and employees all combine to make growth an imperative. However, accompanying the growth imperative is the growth conundrum. The process of growth that many organizations follow is filled with contradiction, inconsistency, and paradox. While companies may take actions *inconsistent* with their growth goals and still be successful, others may take actions *consistent* with their growth objectives and suffer disastrous losses.

Imbedded within this is the fact that the vast majority of growth strategies fail. Many point to the lack of attention to the human factors. And, while there is significant evidence that attention to human resource development issues is critical to successful growth, there is a dearth of models to effectively describe this relationship. The purpose of this research is to develop a model for linking growth strategy to HRD. This model is designed to help organizations understand the impact of HRD on their ability to implement growth strategies. We then tested the model as a tool for diagnosing HR supports and barriers to growth and for developing action agendas.

Review of Literature

Organizational Growth Strategies

For most organizations, radical growth has become a requirement, or as stated by Druckman, Singer, and Van Cott (1997) "Organizations today must function and attempt to flourish under conditions that are complex, rapidly changing and in some respects unprecedented. Voluntary mergers and joint ventures, hostile takeovers and poison-pill resistance to them, conglomerations and divestitures have created an organizational environment of prolonged turbulence." This requirement has been driven by many forces. Investors are increasingly requiring greater returns, evidenced by the radical jump in P/E ratios of stocks today with some carrying unprecedented P/E ratios of over 200. Employee requirements are also driving radical growth. Low unemployment, especially in technology fields, are driving organizations to offer increasing compensation and opportunities (Worth, 1998). For example, a recent study shows that additional compensation in the form of equity ownership has radically increased over the past decade, from less than 2% to more than 8% of total US corporate equity (National Center for Employee Ownership, 1998). Customer demands are also driving radical growth. The volatility of the organization's customer base increases pressure to continually enhance the options, features, and benefits to customers through product innovation and value added service (Bund-Jackson, 1985). Reichheld (1996) has shown that retention of customers is predictive of growth in market share and stock price.

Copyright © 1999 Michael Leimbach and Meredith Ceh

Despite this increase demand for radical growth, several studies have shown that a large proportion of organizational growth strategies has failed. For example, a McKinsey study (reported in Druckman, Singer, and Van Cott, 1997) suggests that 67 percent of large scale TQM efforts failed within two years. Similarly, a Rath and Strong survey (also reported in Druckman, et al, 1997) indicates that only 20 percent of organizational growth strategies achieve their objectives. The American Quality Foundation and Ernst and Young (Ernst and Young, 1992) reported that 95 percent of strategic initiatives studied failed to provide lasting value to the organization. Pare (1994) found that as many as half of all mergers and acquisitions are financial failures.

In all of the studies cited above, the most frequent cause noted for the failure has been the "people factor." Organizations are not paying enough attention to the complexity and extent of the transitions employees must endure to implement growth strategies. Organization's abilities to develop complicated strategies have outpaced their capabilities for implementing these strategies. For example, in a study of mergers and acquisitions within the pharmaceutical industry over the past 30 years, lack of attention to overlap in work responsibilities, incompatible corporate cultures, and lack of communication were associated with a decrease in market share for the combined firms (Economist, 1998a). Several studies have shown that when layoffs are not tied to a specific strategy companies experience a decrease in revenue and stock prices fall, (even when the stock goes up after the initial announcement (Lashbrook, 1997; McKinley, Sanchez, and Schick, 1995). While difficult to quantify, studies have also shown that failure to attend to organizational culture and values as a company grows will create a barrier to success (Druckman, 1997).

While there is strong evidence of a close link between organizational growth strategy and human resource development, there is a decisive lack of models to describe it. The organizational growth literature consists of a series of practices; re-engineering, TQM, strategic partnerships, mergers, acquisitions, downsizing, etc. What is lacking is a coherent model for examining the contribution of human capability to creating and implementing growth strategies. Or, as stated by Druckman, et al (1997) "There is even a lack of descriptive taxonomies to provide a framework to carry out the research." Therefore, The purpose of this research is two fold; one, to develop a preliminary framework for understanding the link between organizational growth strategies and human capabilities, and, second, to test the utility of this framework in an organizational setting. This second step is essential. To develop a model without presenting some test of its validity or utility does not, in these authors' opinion, further the advancement of the field in a meaningful way. While a test of the accuracy or validity of the model is most desirable, we have chosen to present a case study where the model was applied to help understand and address the human resource implications of a strategy to create exponential growth.

Growth Domains

There are multiple pathways to achieving growth. As a result, organizations are abandoning linear approaches that limit strategic options. Strategies that allow for a more holistic or scenario based approach are more appropriate for today's business environment (van der Heijden, 1996; Brandenburger and Malebuff, 1997). To this end, we examine the literature on organizational growth to identify the principle pathways, or domains in which growth occurs. Growth was defined multi-dimensionally; revenue, profitability, number of employees, market share, and stock price. We found four principle areas in which organizations focus resources to achieve growth. We called these: Marketplace, Network Enterprise, Organization, and Individual, constructed around four critical stakeholder classifications.

Marketplace. Achieving growth by focusing on customer requirements is a common concept. Identifying new markets or niches, expanding globally, and enhancing product to meet changing customer requirements are all elements of the Marketplace domain. Marketplace strategies are not effective for all organizations. For example, Ernst and Young (1992) found that strategic planning that focused on defining the companies value proposition, customer performance assessments, and market share and product quality audits are effective only for organizations trying to move from market performer to market leader.

Network Enterprise. Growth through strategic partnerships has become a wide spread practice in recent years. While mergers and acquisitions are historically common, strategic alliances, preferred vendor relations, and multi-enterprise collaborations are increasing in frequency. These relationships are being driven by global competition, scarcity of resources, and the need to share costs and risks (Fedor & Werther, 1995; Druckman, et al 1997). Successful collaborations are those with a clear purpose for the collaboration,

have compatible leadership styles and cultures, and create systems for effective reciprocity in information sharing (Sanker, Boulton, Davison, and Snyder, 1995; Oliver, 1990).

Organization. Creating growth through restructuring and the re-allocation of resources has been the focus of TQM and process reengineering efforts for several years (Ernst and Young 1992; Hammer and Champy, 1993; Rummler and Brache, 1991). The investors or management (as a proxy for the owners) are the principle stakeholders connected to the Organization Domain. Growth in this domain has become more important with the increased role of technology in business. For example, research indicated that one of the greatest barriers to growth is the incompatibility between the technology professionals' requirement for autonomy and organizations' requirement for some kind of control mechanism (Huber, Miller, and Glick, 1990). Also related to the Organization Domain is the topic of culture and values. While its impact on organizational growth is difficult to quantify, it is widely accepted that failure to attend to cultural issues can create significant barriers to growth, and growth can be enhanced by the careful nurturing of a performance oriented culture (Schein, 1992; Druckman, et al 1997).

Individual. Finally, organizations will seek growth by building the capabilities of individuals within their workforce. While organizations have long been involved in enhancing skills through training and development, the notion of leveraging superior human or intellectual capital to gain competitive advantage is now being recognized. This is in part due to increases in knowledge work (Cleveland, 1985). As recently as 1960 half of the US workers were directly involved in the manufacture of tangible products. However, it is estimated that by 2000 no developed country is likely to have more than one-eight of its workforce so employed (Druckman et. al, 1997). The effectiveness with which organizations build new skills, involve employees in the growth process, and create an environment of commitment all have significant impact on an organization's ability to grow (Kotter, 1995, Reichheld, 1996).

Growth Dynamics

Organizational change and growth occur when organizational boundaries change (Druckman, et al 1977). While there is no universal formula for producing effective organizational change, there is a finite and consistent set of dynamics that organizations can use as tools to create and mold change within the four domains. We have classified these dynamics into three types: Permeability, Elasticity, and Momentum.

Permeability. Permeability represents the processes organizations utilize to support and control the exchange of inputs and outputs. The term permeability implies that effective growth is a process of selectivity. In other words, growing organizations must effectively consider and manage new ideas that enter, as well as the information and ideas that leave. An example of permeability within the marketplace domain is Gillette's strict control of the information flow prior to the release of a new product (Sella, 1998). Gillette uses secrecy to ensure a competitive advantage. Within the Enterprise Network domain, Permeability is manifested in the methods organizations use to screen prospective partners. Research has shown that organizations that collect information on critical elements of the partnership (i.e. compatibility of business interest, similarity of values/culture, compatibility of business processes, compatibility of reputations, resource complements) are more successful than those that focus only on the contractual relationships (Druckman et al, 1997). For the Organization Domain, development of the 1997 Corvette (Schefter, 1997) demonstrates how culture creates Permeability. Jim Perkins, General Manager of Chevrolet division at GM, created a stealth culture to continue work on a redesign of the Corvette at a time when GM management contemplated eliminating the line. Finally, within the Individual domain, Permeability is characterized by skill mobility. An organization's ability to retain critical skills and capabilities has a significant impact on its ability to grow Reichheld (1996).

Elasticity. Elasticity describes the methods and mechanisms that facilitate the actual shifting of boundaries. In the Marketplace domain this corresponds to the organization's specific value delivery approach. For example, Square-D corporation utilized internet technology to move themselves (and ultimately their industry) from one of *low-cost* standard circuit boxes to one of *rapid creation* of customized product by reducing cycle time on custom circuit boxes from 12 weeks to 1 week (Economist, 1998b). For the Network Enterprise domain, Elasticity represents the practices supporting the ongoing management of strategic partnerships (Druckman, 1997). Organization Elasticity represents the tools for process re-calabration (Hammer and Champy, 1993), while in the Individual Domain, Elasticity refers to a variety of human resource development capabilities.

Momentum. Momentum is created by centers of influence that support or hinder growth. Market identity is the Momentum of the Marketplace Domain. One of the best examples of this is the relationship

between Seymour Cray and Control Data Corporation (CDC) in the mid-1980s. CDC's market identity, mid-range computers, was not consistent with the developing idea of massive parallel processors (supercomputers) developed by Cray. Like the beginning of any movement, momentum begins as the first stakeholder generates excitement about an idea. Seymour Cray succeeded in creating this energy, but was forced to do so outside the boundaries of CDC, creating the identify of Cray Research and ultimately the industry of supercomputing. Momentum in the Enterprise Network domain is an organization's ability to leverage the combined resources of the alliance partners (Oliver, 1990). Creating the momentum of the investor community is the dynamic for the Organization Domain. Studies have shown that a loyal mass of investors is a significant factor in an organization's ability to secure resources for sustained growth (Reichheld, 1996). And in the Individual Domain, the ability to manage the change process and create alignment and commitment among the mass of employees, is a requirement of successful growth (Kotter,

The Growth Audit Model

Combining the Domains with the Growth Dynamics, you get a framework, or model, of the factors linking growth strategy with human resource requirements. Two additional variables contained in the Growth Audit model relate to the ability to define current and future boundaries (Landscape) and to address internal and external environmental conditions (Forces). These variables are derived from the scenario planning literature (e.g. Van der Heijden, 1996). While these factors are critical to measuring growth potential, they are not a focus of this research.

Figure 1
Growth Audit Model

	Marketplace	Enterprise Network	Organization	Individuals
Landscape				
Boundaries	Value Proposition	Extended Enterprise	Responsibility Centers	Role Fulfillment and Purpose
Horizon	Changing Customers	Potential Enterprise	Expected Value Structure	Redefining Loyalty
Forces				
Chaos	Market Changes	Communities of Interest	Cross-functional Collaboration	Emerging Roles
Competition	Market Leadership	Covenant Relationships	Resource Allocation	Options and Choices
Dynamics				
Permeability	Business Intelligence	Identifying Network Partners	Growth Culture	Skill Mobility
Elasticity	Value Delivery Approaches	Business Development	Business Process Recalibration	Growth Capabilities
Momentum	Market Identity	Creating Partnerships	Investor Relations	Growth Process
Stakeholder Interests	Customers	Partners and Suppliers	Investors	Employees

Research Purpose

While the development of the model represented an important addition to our understanding of the link between growth strategy and human capability, we believe that the effort is not complete unless that model is tested in some way. Therefore, we applied the model to research the human resource supports and barriers to implementing a growth strategy. The organization studied was a major pharmaceutical research center. This company had been experiencing phenomenal growth in revenue and profitability for a number of years. As a result, senior management set some very aggressive goals for the development of new products. In essence the organization wanted to double the number of drug candidates that were produced each year (typically 20 candidates result in one marketable product). As a result the research center was adding 50% to 100% more people, doubling the number of drug candidates, all while maintaining an industry leading success rate (as measured by scientists hours per candidate). The purpose of the Growth Audit for this organization was to clarify the critical issues associated with growth and to provide recommendations and direction for actions to effectively implement the growth strategy.

Research Methods

Sample

The sample for this study consisted of one Therapeutic Group (TG) within this pharmaceutical research center. The research center was organized into TGs associated with specific disease states. This TG was responsible for developing drug candidates for metabolic related conditions (cardiovascular, diabetes, obesity, osteoporosis, and atherosclerosis). The TG was headed by a Director and three Assistant Directors. Reporting to the Assistant Directors were 21 Lab Supervisors. Lab Supervisors are Ph.Ds. in biology that have ultimate responsibility for candidate production. Reporting to each Lab Supervisor is three to four Associates, Bachelors or Masters in biology or chemistry that assist the Lab Supervisors. In all there were 94 people in this TG. Of these 94, 86 actually participated in the study (91% participation). Participation was not 100% because of scheduling conflicts.

Procedures

The Growth Audit approach was a hybrid between an ethnographic scenario analysis procedure and a quantitative survey of values and assumptions. Similar to the "triangulation" approach advocated by Duncan (1989). Two principle methods of data collection were use in this study. First we conducted interviews with the Director and Assistant Directors. These interviews were then used to inform the design of a series of input group sessions, utilizing a group decision support tool (The Innovator® software) to allow us to combine qualitative and quantitative data. The process also employs an action research framework, where the research participants are active in analyzing and interpreting the results. The complete process is described below.

Step 1: Building the Specific Growth Audit Model. The Growth Audit model is somewhat generic. Therefore, consultants worked with a Steering Committee, consisting of 12 people representing all levels and groups within the TG, to customize the model. Most of the changes were cosmetic (e.g. changing "Marketplace" to "Growth Orientation") however, there were some, more substantive changes. For example, modifying the definition of competition to include competition with other TGs. These modifications occurred in a series of three focus group sessions. In general all of the elements of the model were seen as highly relevant to the TG. Adaptation of the Growth Audit model was seen as critical to achieving the TG's goals for the study.

Step 2: Conducting Executive Interview. The next step was to conduct interviews with the Director and Assistant Directors to obtain the executive perspective on each of the Growth Audit elements. The interview process started with a four hour overview of the Growth Audit model. This provided the executives with an opportunity to think about the issues before the interview. The next day one-on-one interviews were conducted. Each interview lasted about two hours. Two consultants were present during each interview and maintained independent records of the responses. These records were then compared and any discrepancies addressed.

Step 3: Synthesizing Interview Data into a Growth Narrative. Three consultants reviewed the interview records and identified principle content themes. The themes were consolidated and merged into a final list of content categories. Then the three consultants independently reviewed the interviews and categorized responses according to the content categories. While specific records of inter-rater reliability were not kept, there were very few discrepancies. Finally, these themes were synthesized into a Growth Narrative. This narrative was used within the input group sessions to communicate the intent of the growth strategy, the strategic choices facing the TG, and the human resources issues as perceived by the executive team. The Steering Committee reviewed the narrative to assure that it was relevant and meaningful to input group participants. A narrative script was developed to ensure consistent delivery of information across all input group sessions.

Step 4: Building the Input Group Session Template. The Growth Audit Model and the Growth Narrative were used to construct polling questions that were incorporated into an Innovator® software template. The Innovator software allowed participants to respond to a set of survey items, see the results of this survey immediately, and then discuss their opinions and concerns. The combined qualitative and quantitative analysis enabled us to enrich the findings and make cross group comparisons. The input group session template was first tested by the Steering Committee and revised prior to the actual employee sessions.

Step 5: Conducting Growth Audit Input Group Sessions. Nine input group sessions were conducted over a course of one month. Each session was introduced by the Director who set expectations. During the sessions, the Growth Narrative was read and the polling questions were voted on. The results of the polling were displayed on a projection screen and the consultants facilitated a discussion of the results. Discussions tended to focus on particularly salient or surprising results. Both consultants transcribed qualitative data from group discussions. Sessions concluded with an open-ended activity to solicit participant ideas regarding overall supports and barriers to growth. The group also ranked and discussed these ideas. In addition to the Growth Audit polling items, three demographic variables were also collected.

Analysis

The three consultants reviewed transcripts of the input group discussions, and principle themes were identified. Then two consultants independently reviewed each transcript a second time and categorized the responses by the content themes. The analyses of the consultants were compared and discrepancies resolved. While specific records of inter-rater reliability were not maintained, differences in content categorization were minimal. Input group survey items were examined using means and standard deviations.

Next, we examined the content themes to identify specific patterns that might reveal underlying causal factors illuminated by the model. This resulted in two outcomes. The first is a list of patterns predicted by the model and identified in the results, and second, it led to construction of a causal map of the growth supports and barriers. These will be discussed in the results section below.

Results

While a detailed discussion of the actual results is not possible here, we will illuminate specific findings that illustrate the utility of the Growth Audit Model. Specifically, we would like to discuss growth pattern recognition and causal maps that emerged from the findings.

Patterns Affecting Growth

Inherent in the Growth Audit Model is the hypothesis that opportunities for growth reside in examining the patterns across the four domains (Marketplace, Enterprise Network, Organization, and Individual). While each domain has its own unique dynamics, that doesn't mean that movement in one level does not influence the dynamics of another. Therefore, we looked for confirmation of these patterns in the results for the TG studied. We found three.

Cross Domain Conflicts. Expression of a specific growth strategy in one domain will send signals to other domains. These signals, if they are in conflict, should reveal potential barriers to implementation of the growth strategy. We found several examples of this. For example, analysis of the Marketplace Domain

revealed an increased need for greater business management skills on the part of Lab Supervisors. With the emergence of managed care organizations as principle customers it had become clear that drug development must acknowledge the implications of drug formularies. Unlike the past, new drugs that were just as good or even slightly better (fewer side-effects, more efficacious) would not make it on managed care formularies. Rather, the drug had to offer qualitative leaps in performance for a managed care organization to go to the expense of offering it. However, analysis at the Individual Domain revealed that the organization did not share this perspective on the need for business management skills. To the survey question "We have appropriate levels of business thinking skills" less than 20% disagreed. Discussion revealed that the majority of Lab Supervisors believed that this was the Directors responsibility and viewed the executive comments as efforts to "off-load" these activities onto the Lab Supervisors.

Dynamic specific levers. A third hypothesis generated by the model is that an organization's barriers to strategy implementation will cluster around specific Growth Dynamics across levels. This was partly supported in this research. We categorized the themes according to the Domain and the Dynamic and found that there was a critical barrier in all Domains relative to Permeability. This organization had a complete lack of competitive intelligence processes (Marketplace Permeability), has difficulty in creating an effective work relationships with strategic partnerships, principally bio-tech firms (Enterprise Network Permeability), expressed fear that their work culture was in jeopardy because of the rapid growth (Organization Permeability), and that growth was further devaluing the role of the Lab Associates who had limited opportunities for promotion or career development (Individual Permeability).

Momentum migration. Rapid growth is more easily obtained when there is a critical mass of stakeholders committed to the new strategy. While it is possible to create momentum, organizations can use the momentum from an existing critical mass to increase the speed of growth and change. Even when there is opportunity for growth, if the critical mass lags behind a corporate initiative, the initiative will inevitability stall because there is no momentum to change the current state. We found two critical examples of Momentum lagging behind the growth strategy. First, described earlier, was the unwillingness of the majority of Lab Supervisors to accept the need for taking a business perspective. Most Lab Supervisors were highly successful academic researchers who viewed "business issues" as beneath them. Lab Associates also represented a significant Momentum that could stall strategy implementation. Their satisfaction with the status quo was motivated mostly by the loss of a small, closely-knit, lab environment and concern over their career opportunities caused by the adoption of new technology that will reduce the interest value of the Lab Associate job.

Causal Maps

One of the intended outcomes of the Growth Audit Model is the ability to clarify the links between strategy and human capabilities. To this end, we examined the themes that emerged from the research to determine if they lead to any hypotheses concerning the causal relationship between strategy and human resource practices. We examined the data for statements of causality that linked two or more themes together. The result is the Causal Map below (see figure 2).

The map suggests that there is a link between the communication of strategy and the culture or behavioral practices seen within the organization. The links are moderated by the emotional impact (in the star box) created when the actions (the ovals) associated with the specific situation (boxes) are not meet. For example, with regard to Strategy, participants expected certain information to be communicated (priorities, the logic of the strategy, the vision, how alignment will be created). When these are not communicated, they create an emotional reaction (feelings of isolation, lack of clarity). These reactions impact employee's ability to support Implementation of the strategy.

Discussion

During the industrial age predictable linear growth was easily achieved. In the recent past growth was obtained through brute-force productivity improvements and cost reductions. As these begin to yield diminishing returns, organizations are abandoning the tools of the linear planning process. This new, non-linear planning process requires tools and methods that are substantially different from those used in the past.

This also means different approaches for human resource development. When strategic planning was more linear, human resource planning was easy but reactive. However, in an environment where planning is less linear and more iterative and systemic, HRD planning needs to play a central role in identifying supports and barriers to strategy implementation. HRD has long desired to play a more strategic role in organizational action. The Growth Audit case example illustrates one way to define HRD's role as a core element of strategy implementation.

This paper and research effort draws its inspiration from a set of real business issues facing an organization and it's human resource development capability. We believe that this is an important characteristic of model or theory development. There has been an tendency in our field to create increasing complex models of organizational behavior without concern for demonstrating the utility or predictive power of these models. While clearly this model needs further testing and validation, by using it to identify real world supports and barriers to growth we have demonstrated the potential value before presenting it as a model for other human resource development professionals to consider.

A Study of the Role of HRD in Response to External Environmental Change in Public Service Organizations.

Kenneth R. Bartlett
University of Illinois at Urbana-Champaign

This study explores the role of HRD in response to external environmental change as a component of strategic human resource management-planning. The study population of public leisure service organizations represent an understudied yet common form of public service organization. Results show a high level of support for HRD activities highlighting the need for HRD researchers to concentrate efforts on developing frameworks that are of equal applicable in both large private and small public agencies.

Keywords: HRD Planning, Environmental Scanning, Public Agencies

Introduction

A recent awareness within both private and public organizations has been the recognition that human resources (HR) represent the most important asset of the organization (Nickell, 1995). Others stress that human resource management (HRM) determines the success or failure of an organization (Wright, McMahan & McWilliams, 1994). The role of human resource development (HRD) is now seen as a central component of competitiveness (Lengermann, 1996). As such, HRD practices must be aligned with the mission of the organization and changes occurring within the organization's external environment. The external environment is increasingly seen as an area warranting the attention of HRD managers (Greer, 1995).

There is wide spread agreement in both the popular and academic press that organizations now face increased pressure from their external environment (Lundy, 1994). Factors such as increased competition, new technologies, increasing levels of legal compliance, the beginning of the global marketplace, changes in social demographics and the workforce, a diversification of products and services as well as an increased responsibility to provide for the quality of life for employees greatly impact the environment in which organizations operate (Rothwell & Kazanas, 1994). Such change is likely to continue into the next century, with predictions that "the 21st century will be even more complex, fast paced, and turbulent" (Cascio, 1995, p. 928).

Problem Statement and Theoretical Framework

The need to plan for HRD and the need to envision a future state of an organization's HRD activities is commonly referred to in the literature (Rothwell & Kazanas, 1988). Few in the HRD profession question the importance of making HRD more future-oriented and giving HRD practitioners a role in formulating organization strategy (Torraco & Swanson, 1995). However, the development of a strategic approach to HRD appears a relatively recent development (Lee, 1997). Increasingly, short-term HR needs cannot be met by external labor markets, highlighting the role of HRD in the long-term demand of preparing people for assuming greater responsibility in achieving organizational strategies (Nadler & Wiggs, 1986).

There can be little doubt that strategic planning processes for HRM has increased in importance in both public and private organizations in recent years as evidenced by the wealth of literature (for example, Huselid, 1995; Wright & Snell, 1991). Environmental scanning, as a component of the strategic HRM model, helps identify, modify, and prioritize methods to pro-actively deal with the never-ending change in the world in which organizations operate. HRD plays an important role in the strategic HRM process.

Human capital theory has advocated the use of training to make employees more productive (Becker, 1975). Human capital theory states that the use of general training raises the skill, knowledge, and ability (KSA's) level of all employees in the industry whereas the use of specific training is seen as beneficial to a single employer (Lengermann, 1996). Therefore, HRD activities, as part of the strategic HRM process, have the potential to assist both an industry and individual organizations within the industry deal with external environmental change.

The vast majority of literature on environmental scanning for HRM and HRD has focused on large private organizations. Corporate America now recognizes the importance of aligning human resources with the changes

Copyright © 1999 Kenneth R. Bartlett

occurring in the environmental external to the organization, yet little evidence is available to determine if public agencies engage in similar practices. In many small and medium-sized public organizations, HRD activities are not well developed. Similarly, little is known of the role of HRD in response to external environmental change in public agencies.

One form of public organization receiving very little HRD research is public parks, recreation and leisure service agencies. Public park, recreation, and leisure service departments provide a wide array of activities, programs, facilities, areas, and information. Local public leisure service organizations operate at the municipal, county, and special district level with each agency being organized and structured to meet specific community needs (Edginton, Jordan, DeGraaf, & Edginton, 1995). These organizations are seen as being an archetype of most small public agencies due to their small size and emphasis on administration of specific programs and activities requiring specialized training (Hamilton, 1995). For over 90 years, public agencies have been the most dominant delivery system for parks, leisure and recreation services (Sessoms, 1987). However, in recent years, public leisure service agencies have experienced massive transitions and increased pressures. This study seeks to incorporate the strategic human resource management model and human capital theory to investigate the contemporary external environmental challenges facing public leisure service organizations and the subsequent HRD response.

Research Questions

To examine the objectives of this applied research, the following questions were addressed:

1. Do directors of public leisure agencies believe that changes in the external environment will impact the HR employed?
2. Do directors anticipate that managerial action in the form of HRD activities will be required to reach organizational goals in the face of environmental changes?
3. Do managers plan common HRD activities in response to identified changes to aid in their planning of present and future HR needs?

Methodology

An instrument was developed based on existing literature for identifying trends in public park and recreation agencies (McKinney and Lowrey, 1987). Six external environment sectors were identified as being relevant to the management of public leisure agency operations. These sectors of the external environment were economic; demographic; political and legislative; technology; recreation programs; and parks, facilities, and natural resources. The resultant instrument was submitted to an expert panel of practitioners and academics to confirm face validity. These sectors were used to develop unstructured questions to elicit anticipated changes in the external environment and the possible impact of these changes on the HR employed. These questions followed a similar format to previous personnel planning instruments used to describe future trends and their possible effects on public and not-for-profit organizations.(Moore, 1986).

The sample consisted of executive directors (or equivalent title for the chief executive officer) of public park, recreation and leisure agencies in Illinois. This level was chosen because, ultimately all HRD activities must be approved by the executive director, requiring this individual to have both a present and future focus towards the HR employed. The sampling frame consisted of 289 public leisure agencies within the state of Illinois listed in the 1995-96 Illinois Association of Park Districts (IAPD) Membership Directory. From this list, a sample of 56 agencies was obtained using a stratified approach. The majority of public park and recreation agencies within the state are located in or near the city of Chicago. To avoid sample bias, the state of Illinois was divided into four areas based on IAPD Voting Zones with boundaries defined by county. A multi-staged sampling technique was used to select a representative number of agencies from each of the four areas with probabilities proportional to the number of agencies represented in each zone.

Data collection was conducted using an adaptation of the Salant & Dillman (1994) technique. By the closing date, a total of 46 usable surveys were returned for an 82% response rate. A combination of qualitative and quantitative data analysis techniques were used to evaluate the data. Qualitative data analysis focused on the identification of common themes using a reduction and interpretation approach as outlined by Marshall and Rossman (1989). Quantitative analysis used frequencies and descriptive statistics.

Results and Conclusions

All respondents identified a variety of external environmental changes anticipated to impact their agency over the next five to ten years. Wide spread agreement was found on issues related to the changes and challenges expected in the economic, demographic, political and legislative, and technology sectors of the external environment. Responses in the areas of recreation programs, and parks, facilities, and natural resources also show a high degree of agreement with seven common themes identified.

The emphasis of the study related to public leisure agencies' HRD responses to the identified changes. The provision of training was listed by 95% of respondents as the primary way to ensure that employee's posses the new knowledge, skills, and abilities (KSA's) needed in a dynamic changing external environment. The most frequently identified area for HRD activities was to increase computer skills (71%). The second most-reported response was the increased demand for employees to have specialist skills. Examples given by respondents included public relations, business management, and recreation programming (60%). Twenty six percent of respondents mentioned the need for HRD activities to develop employees with an increased level of communication skills. The need to provide language training so that staff can be bi-lingual to deal with an increasingly diverse client base was mentioned also 17% of the directors. The demand for HRD activities that encourage individual employees who have an interest in life-long or continuing education was mentioned by 12% of those responding. Training that gives employees the ability to form partnerships and work in a team environment was noted by only 10% of the directors. Other findings in this section of the survey included the desire for training and development programs that result in personnel with increased political skill and savvy.

Training has become a multi-billion dollar per year industry yet much confusion surrounds the range of appropriate activities to develop the desired KSA's of employees (Chachere & Martocchio, 1996). Training is widely acknowledged in the literature as the traditional approach to overcome shortcomings in the KSA's of employees (Rothwell & Kazanas, 1994). The range of HRD activities is enormous with Butler, Ferris, & Napier (1991) suggesting a classification framework based on time. This linear continuum of HRD commences with short-term training activities and carries onto long-term career planning (also known as employee education) which can be an ongoing process occurring through the employee's career (Rothwell & Kazanas, 1994).

The responses received in this study indicate that confusion surrounds the use and terminology of HRD activities within public park and recreation organizations. Among the 95% of agencies responding that additional training would be provided, many provided information as to the type of training intended for delivery. Many of these comments suggest activities that could be classified as employee development or career planning. In-house training programs were noted in 31% of the responses. This may suggest that a number of public leisure agencies perceive that their employees possess immediate gaps in the required KSA's for their current position. Career development programs were mentioned by 18% of directors indicating that they would be providing training. 24% of directors made reference to the provision of education opportunities for employee's which could be a reference to both short-term training and long-term employee development activities. This confusion of suitable HRD activities may result from the limited literature on the use of employee education in public agencies in general and in particular, within public leisure service organizations.

The choice to replace existing HR with the recruitment of new HR rather than invest in HRD activities was noted by more than 15% of those responding. Further probing to determine why agencies feel the need to replace existing staff would prove enlightening. Perhaps this raises problems in the recruitment, selection, and testing procedures of public leisure agencies. It may also be a reflection of past poor investments in training and development.

Implications for HRD Practice

This study investigates external influences on the planning and management of HRD activities in public leisure agencies within the state of Illinois. This study utilizes the external environmental scanning technique to identify likely changes, their possible impacts, and the HRD response to an understudied form of public organization. Small public organizations such as public leisure service agencies have been largely overlooked in the literature on determining HRD strategies. This study is of practical importance to leisure service managers to assist in future strategic HRD planning and development activities. The external environmental scanning process imbedded in the strategic HRD framework offers a potential model in which to gather information to guide HRD planning efforts.

This study has illustrated that public leisure service organizations are subject to many of the same external environmental pressures that other organizations face. The application of applied HRD to this sector of public service highlights the need to conduct research in a variety of organizational settings to further our knowledge of

training and development. This confirms the finding of an earlier related study in the public leisure service management field which suggested that, "there is always a need for staff training and development in park and recreation organizations" (McKinney & Lowrey, 1987 p. 1). As people demand more leisure services from their local park and recreation agency, the pressure on existing and future human resources to be suitably equipped with the required KSA's will increase. As the commitment and expenditure for training and development increases, it becomes vitally important to determine the most appropriate HRD activities for the employee, organization, and the publics they serve (Reyna & Sims, 1995). This study has highlighted the high level of support for HRD activities to prepare employees of public leisure organizations for future changes emanating from the external environment. It has also demonstrated a level of confusion surrounding the appropriate use of HRD activities within one type of public service organizations.

Further study is needed to understand the HRD function in small public agencies. Additional research on the uniqueness of small public organizations would be beneficial before HRD models developed in private organizations are universally applied. Sleezer and Sleezer (1997) have stated that the ultimate goal of HRD is to "support and improve individual, process, and organizational learning and performance" (p. 185). This applied research study has shown that HRD researchers should concentrate efforts on developing frameworks that are of equal assistance to the manager in a large private company as they are to the manger in a small public agencies.

Operationalizing Alignment: Testing Alignment Theory

Steven W. Semler
Personnel Decisions International

This paper presents a theory-based operational definition of organizational alignment for the purposes of research. It includes an operationalization of the alignment construct and a description of an alignment measurement instrument.

Keywords: Alignment, Instrument

Many people who work with organizational performance for any length of time develop an intuitive understanding that the different components of an organization must be properly organized and balanced with each other for optimal performance (Rummler & Brache, 1990). This proper organization and balance between parts of the organizational system is called alignment.

Alignment is presumed to minimize conflict between the parts of the system, and to direct effort toward shared goals (Labovitz & Rosansky, 1997; Semler, 1997). Many people claim that alignment is important, even vital, for organizational success, but research has not produced any empirical data to support or refute these assertions. This limitation has manifested itself in the widely varying degrees of success that human resource development (HRD) practitioners have had increasing alignment in organizations for the purpose of improving performance (Bennett, Fadil, & Greenwood, 1994; Kerr, 1989; Kotter & Heskett, 1992; Labovitz & Rosansky, 1997). A better understanding of how alignment really works would aid both HRD research and practice by allowing us to separate fact from conjecture in our efforts to predict and improve performance.

Two of the prerequisites to empirical research are research constructs and measurement instruments that are based in the theory describing the phenomenon of interest. A search of many research and practical databases (ABI Inform, Alta Vista, CARL, ERIC, SocAbstracts, University of Minnesota LUMINA, all in 1998) produced few theory-based constructs of alignment, and no measurement instruments. This paper provides some further steps toward an operational definition, construct, and measurement instrument to make possible an empirical test of theory and practical assumptions about organizational alignment.

Theoretical Background

Different theories of strategic organizational alignment have been with us since the 1970's. Nadler and Tushman's (1989) insightful work on *congruence* conceived of the organization as an open system that was composed of interdependent inputs, process components, and outputs. The whole system functioned with greater or lesser effectiveness depending upon the degree of congruence, consistency, or fit between each pair of system components. Nadler and Tushman's congruence model of organization behavior was originally published in 1980 and adequately represents the core of nearly all later discussions of organizational alignment. Later research has offered additional information that expands the power of their theory and extends the concept of alignment into improved organizational change models.

Alignment is an essential component of most total quality management systems, as reflected by the Malcolm Baldrige National Quality Award (MBNQA) emphasis on alignment of business systems. Merron considers alignment to be a means to the goal of organizational quality performance, "Clarity and alignment among the five aspects of organizational life--purpose, objectives, strategy, structure, and culture--are key to the proper direction of the organization" (1994, p. 52). Labovitz and Rosansky add their own emphasis on the importance of alignment to these insights and quote Fred Smith of Federal Express as saying that "Alignment is the essence of management" (1997, p. 6).

As HRD research and practice have advanced, it has left behind earlier work on alignment. The McKinsey 7S Model and Galbraith's (1987) "Star Model" offered related models of organizational capability for competing in changing environments. These models presented the primary variables and noted the importance of alignment between them, but did not specify the relationships between variables. Instead, these models suggested merely that the variables were interdependent and that attending to and balancing the effects of each in the organizational design process would produce alignment, and thus performance. Alignment would ensure a greater degree of performance by increasing cooperation among different aspects of the organization's operating design.

Copyright © 1999 by Steven W. Semler

While models such as the 7S and Star Models could help organizations target areas for performance improvement, their assumption that strong alignment is desirable was not backed up with either theory or specific research. Some writers now question a basic premise of alignment—that increased alignment has a positive effect on performance—by suggesting that too much alignment might impair organizational flexibility and thereby decrease competitive performance (Kotter & Heskett, 1992). In this view, "over-alignment" could reduce openness to diversity of thinking and ideas and make the organization too rigid in response to changing conditions. There is no way of knowing whether this is correct until researchers can gather empirical data to test the proposition.

Semler (1997; 1998a; 1998b) has done the most recent theoretical work to attempt to define and describe alignment in terms that might would prove useful for research. At present, his is the only work available that defines the relationships between variables and specifies testable propositions of alignment theory. Semler's theory is based upon a synthesis and extension of the earlier work of others, such as Nadler and Tushman (1989), Rummler and Brache (1990), and Tichy (1983). It describes in detail several relationships between variables and theoretical propositions that could be tested through research (Figure 1).

According to Semler's theory, strategic alignment produces greater organizational performance through two mechanisms. First, alignment focuses the discretionary effort of organizational members on the goals of the organization. Second, alignment provides systems more conducive to pursuit of the selected strategic goals than to any other goals. Both of these intermediate outcomes influence essential determinants of performance. Discretionary effort strongly influences knowledge and motivation. Goals-conducive systems strongly influence individual and system capabilities.

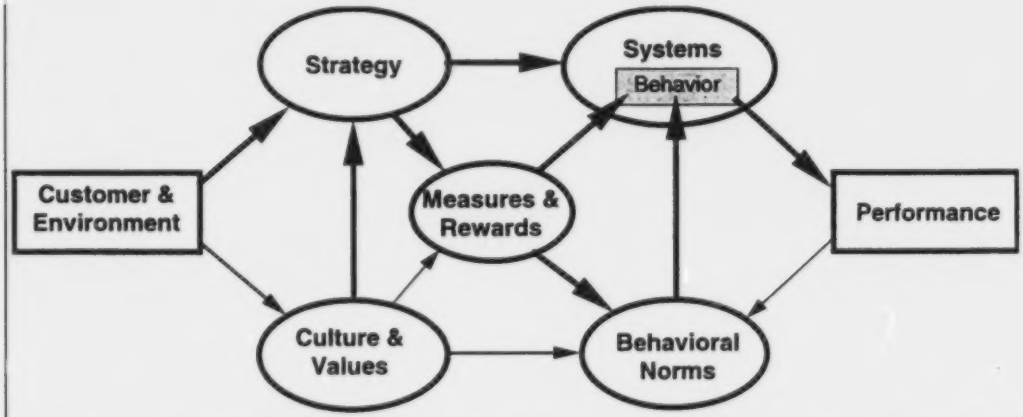

Figure 1. Strategic Alignment Model. The model shows the essential variables and their relationships. (Semler, 1998b, p. 6)

Semler also proposes that the effect of leadership is to increase the degree of agreement between variables in each of six dimensions of alignment. At any given point in time the states of agreement represented by the dimensions of alignment, taken as a whole, indicate the overall degree of strategic alignment of the organization. Increased agreement within a dimension of alignment increases the determinants of performance related to the dimension. Therefore, the greater the overall strategic alignment, the greater the performance determinants will be, and the greater the resultant organizational performance produced. The basis of Semler's theory is outlined below:

Theoretical Propositions of Alignment

1. There are sets of specific, observable behavioral indicators that describe alignment for each of the dimensions of alignment.
2. There are four determinants of organizational performance—knowledge, motivation, individual capability, and group or system capability.
3. The state of alignment in each dimension has a partial effect on the determinants of performance related to that dimension.

BEST COPY AVAILABLE

4. The combined effect of the dimensions' effect on the performance determinants determines the portion of organizational performance that is within the control of the organization.
5. Leadership affects the state of agreement between variables in the alignment dimensions. (Semler, 1998b, p.3)

These propositions make it possible to build an operational definition of alignment and an instrument to measure alignment at a point in time, based upon the behavioral indicators.

Alignment Construct

The alignment construct is composed of variables and the relationships between them. The variables in Semler's alignment model are the things that must have proper organization and balance in relationship to each other for optimal performance. The direction of influence in the specific relationships determines the theoretical "flow" of alignment that can be of use to practitioners seeking to intervene in the organization.

Variables.

Alignment is the degree of agreement *between* variables in the alignment construct, but not the individual variables themselves. The eight major variables pertaining to organizational alignment are:

1. *Customer and Environment* (independent variable) describes the context within which the organization's strategy, values, behavior, and performance occurs. It provides opportunities and limitations that influence the organization's freedom of action and definition of successful performance. Customer and market demands greatly influence organizational strategy (Labovitz & Rosansky, 1997; Pearce & Robinson, 1994).
2. *Strategy* (independent variable) is the set of rational goal states intended to place the organization in an advantageous position and/or configuration within its environment. Successful strategy depends upon an accurate assessment of internal and external conditions. Strategy includes vision, plans, and communication (strategy deployment) at all levels of the organization (Pearce & Robinson, 1994; Wall & Wall, 1995).
3. *Culture and Values* (independent variable) refer to a set of implicit and explicit preferences and judgments concerning what is qualitatively good, bad, desirable, or undesirable. Values are a component of organizational culture and will be shared, in greater or lesser part, by the majority of members of a culture. The culture will transmit values to new members and will maintain a sense of continuity of values over time (Kotter & Heskett, 1992; Schein, 1990). There is no explicit or implicit reward or penalty for holding a certain set of values, only for displaying behavior derived from values.
4. *Norms* (independent variable) are implicit cultural guidelines that influence behavior. They form standards that facilitate interaction between members of a culture, and have a strong influence on the range and frequency of behaviors that members of the culture will display. Norms, like values, are a component of organizational culture. They will be shared by the majority of members of a culture and will be transmitted over time (Bennett et al., 1994; Schein, 1990). Norms are distinct from values in that they do not necessarily represent preferences and judgements, but are linked to formal and informal rewards and penalities for behavior.
5. *Measures and Rewards* (independent variable) comprise the set of policies, procedures, pay and benefits scales, incentive programs, promotion and disciplinary systems, and interpersonal interactions that provide tangible or intangible incentives and disincentives to individual members, groups, and teams within the organization. Rationally designed reward systems are a formal part of the organizational structure that encourages or inhibits specific behaviors (Bechet & Walker, 1993; Britton & Ellis, 1994; Kerr, 1989).
6. *Systems* (independent variable) are the structural elements within the organization that move or transform resources (information, matter, and energy) to produce desired outputs. The systems variable includes core work processes, information systems and learning processes, financial and administrative control methods, and the structure of the organization. Systems are designed rationally to meet particular goals (Jacobs, 1989), but often stray from perfect rationality in operation. Many sub-systems will comprise a typical essential organizational process, and the most basic unit of analysis is the individual job. From the smallest filing process to the organizational system as a whole, systems form the rational structure of the organization (Juran, 1992; Rummler & Brache, 1995).
7. *Behavior* (mediator variable) is the observable activity of individual and group actors within the organizational system. Any given behavior is directed toward one or more goals of the actor, which may or

may not contribute or be intended to contribute to achievement of the strategic goals (Campbell, McCloy, Oppler, and Sager, 1993).

8. *Performance* (dependent variable) is the collective output of individual and group behavior in the organization as moderated by the capability of organizational systems. Conceptually, organizational or system performance can be represented by the formula (*affect x behavior x cognition x system capability*) directed toward a specific result (Campbell et al., 1993). These determinants of performance manifest in a weighted set of organizational performance indicators. The specific indicators are determined by each organization and define performance that organization alone. Each indicator falls within one of seven categories suggested by Sink, Tuttle, and DeVries.

> Performance of an organizational system (i.e., a work group, cost or profit center, division, function, plant, firm, etc.) is comprised of at least seven criteria. These are: effectiveness, efficiency, quality, productivity, quality of work life, innovation, and profitability/ budgetability (Sink, Tuttle, & DeVries, 1984, p. 267).

Sink, Tuttle, and DeVries' definition of performance allows the flexibility for each organization to determine what specific outcomes are important to its unique goals, environment, and "personality." This offers an interpretive measure that is not generalizable with standard statistical algorithms, but that provides richness for practitioners. The concept mirrors the "Balanced Scorecard" approach, however, and can provide a good basis for a more objective set of performance indicators.

Relationships.

Alignment does not refer to any one variable alone, but instead to the relationship between pairs of variables. The degree of agreement or congruence between variables defines alignment. The variables alone do not have meaning in terms of alignment. The following table shows the variable pairs that relate to alignment.

The leading variable...		... directs the receiving variable
Customer & Environment	⇒	Strategy (goals)
Organizational Values	⇒	Strategy (goals)
Strategy	⇒	Rewards
Strategy	⇒	Systems/Structure (overall purpose)
Strategy (goals)	⇒	Strategy (deployment)
Systems (overall purpose)	⇒	Systems (components)

Alignment theory refers to each variable pair as a dimension of alignment (Semler, 1998a). For each dimension, the *leading variable* is the one that ideally determines the state of the other, labeled the *receiving variable*. Although both variables are theoretically interdependent (Galbraith, 1987; Semler, 1997), the system characteristics of the leading variable give it more influence over the receiving variable (Boulding, 1956). Each of the receiving variables can be hierarchically nested within the scope of its leading variable.

This plays itself out in the ease with which one variable can affect the other. For example, it is easier to select a strategy that will meet the constraints of the customer and market environment than it is to change the environment itself. This is because the environment has higher system characteristics into which the organization's strategy is nested. Thus, the customer and market environment is the leading variable and the strategy is the receiving variable.

The interactions between leading and receiving variables manifest as specific organizational behaviors that people within the organization can observe. For example, within the *customer & environment ⇒ strategy (goals)* dimension, one specific, observable interaction might be the degree to which the strategy (receiving variable) reflects information about the customers (leading variable). An interaction in which the receiving variable is determined by the leading variable is labelled a *correct interaction*.

Operational definition of alignment.

The operational definition of the alignment construct is the frequency of correct interactions in which the leading variable determines the state of the receiving variable. For the purposes of research, this could be measured by the frequency of correct interactions in each dimension of alignment that subjects report on an instrument that describes the behavioral indicators of alignment.

Measuring Alignment

This operational definition of alignment allows us to create an instrument to measure alignment. The instrument presented here in abridged form measures the degree of alignment between the variables in each alignment dimension using a 48-item questionnaire (Appendix 1). The degree of alignment for each measurement dimension is expressed as incidence of observed organizational behavior on a 1-5 scale. A researcher could add additional dependent variable measures of performance to the questionnaire, or might collect objective data from other sources.

Each questionnaire item reflects a behavioral indicator predicted by the alignment theory. The scale is constructed to match high ratings with indicators that the theory predicts would be present in a strongly aligned organization. Each set of items provides a picture of the state of its corresponding alignment dimension at a point in time within the organization, as defined by the perception of the respondents.

The author began the validation and reliability assessment process for the alignment instrument in mid-1998. This was not complete at the time of publication. Validation is to be determined by expert panel review for face and construct validity. A single-organization assessment of test-retest reliability will follow the expert panel review process. The limitations of a self-report, volunteer, perception-based instrument are obvious, and acknowledged. This author proposes that the benefit of having a theory-based instrument that measures perceptions of alignment is, for the present, better than the alternative of having no instrument at all.

Analyzing Alignment Data

The research instrument presented here can provide several types of data.

1. A mean score for each questionnaire item from among the respondents for the subject organization,
2. A mean composite score for the alignment dimension, as above, and
3. A mean composite score for the overall alignment of the organization.
4.

With a research sample of satisfactory size and a set of dependent variable measures, these data make it possible to determine the correlation between the items, dimensions, and overall alignment and the organizational performance results. A researcher could analyze the results with linear regression, discriminant factor analysis, or other related statistical technique.

The statistical analysis could determine the partial contributions of each dimension of alignment to the measures of organizational performance. This type of data set would also permit the researcher to calculate item intercorrelations between organizations. Intercorrelations would conceivably demonstrate the degree to which alignment dimensions make the same relative contribution to performance in different organizations.

Summary

Organizational alignment represents the systematic agreement between the different major elements of organizational life. Alignment theories do not presuppose that alignment is the only important predictor of organizational performance, or that overall organizational success can be explained by alignment alone. They do suggest that an organization that aligns its strategy with its values and customer imperatives and that then aligns all of its systems and activities to support its strategy will be most effective.

Until we can measure and examine alignment, however, this is all just conjecture. We do not really know what effect alignment has on performance, or what interventions might improve alignment. HRD professionals have the responsibility to improve performance and enhance learning at the organizational level. If alignment represents the collective power of people focused on the "Main Thing" for their organization, HRD should be able to identify and facilitate that power. We may be able to affect alignment and it may be sound route to learning and performance, but we will not know for certain until empirical research offers some results.

The first step toward more effective intervention strategies is reflective practice and research. In order for research to increase our understanding of organizational life, the researchers must have tools with which to measure the obejcts of interest. Only when something can be accurately measured can we make sound comparisons from specifics to general cases. Only when we can explore reasonable generalizations can we predict well enough to make informed decisions to guide practice. In the end, effective practice will benefit from an increased understanding of alignment.

This operational definition of alignment and the measurement instrument offer some first steps toward empirical data. By specifying how alignment affects the determinants of performance, the alignment construct makes the link between alignment and performance easier to test. The leading and receiving relationship in each alignment dimension should provide guidance to researchers and practitioners. In addition, the behavioral indicators for the alignment definitions should provide some clear examples of how one might observe the state of alignment within the organizational context. When considered and tested within a theory-based study, researchers can use these tools to increase our understanding of alignment.

The benefit of an increased understanding of how alignment works is that practitioners can more easily and confidently design and implement interventions that take alignment into account. Theoretically, by improving alignment they can have a greater degree of confidence that actual performance improvement will result. There is a possibility, however, that alignment is not worth bothering about. Until we can get accurate data and test our assumptions, we will not be able to know.

Appendix 1. Alignment Measurement Instrument (abridged)

Assessment Rating Scale

The numbered statements below describe things that you may have observed in your organization. Rate each statement according to how much it describes your organization, using the following 1-5 scale.

5 = to a very great extent
4 = to a great extent
3 = to some extent
2 = to a little extent
1 = not at all
NA = I don't know or have not observed this

Customer & Environment ⇒ Strategy Alignment

Dimension Definition: Characteristics, processes, and practices that make the organization's strategy most likely to succeed within its market by meeting or exceeding the expectations of its customers.

1. Our strategy is based upon valid and reliable information about our customers and market environment.
2. Our strategy takes recent industry trends and developments into account.
3. Our strategy is based upon the needs and wants of our current and future customers.
4. Our strategy clearly shows how we will meet or exceed our customers' expectations.
5. We plan to use our existing strengths to move toward strategic goals.
6. Our strategy is designed to build our capability for the future.
7. Our strategy includes plans to develop or acquire the organizational capabilities we will need to keep up with or lead the market.
8. Our strategy includes features that will help us to respond rapidly to changing competitive conditions and customer demands.

Organizational Values ⇒ Strategy Alignment

Dimension Definition: Characteristics, processes, and practices that make the organization's strategy most likely to be accepted by its members by incorporating their values, hopes, beliefs, and aspirations.

9. Our strategy offers employees at all levels something more to strive for than a paycheck.
10. Our strategy balances the requirements of our customers and market environment with the existing values of the organization.
11. Our strategy honors and reflects the values of everyone in the organization.
12. Our values support the kind of things that our strategy requires for success.
13. Our strategic goals are based upon the core values and shared purpose of the organization.
14. Our strategy inspires commitment by appealing to employees' values.
15. Our strategy inspires action by appealing to employees' values.
16. Our leadership considered our organizational culture and values as they developed the strategy.

Strategy ⇒ Rewards Alignment

Dimension Definition: Characteristics, processes, and practices that provide formal and informal incentives to behave in ways that support achievement of the organizational strategy. These include performance management systems, promotion and compensation systems, and how much attention managers and executives pay to information and people.

17. Our promotion system rewards those who help the organization achieve its strategic goals.
18. Our compensation system rewards those who help the organization achieve its strategic goals.
19. The way we assign work or projects rewards those who help the organization achieve its strategic goals.
20. Each person has important incentives to work toward our organization's strategic goals.
21. Our reward and incentive structure supports the things we need to do to achieve our strategic goals.
22. Work or projects that contribute the most to the strategic goals get the most attention.

23. Our system of reports, progress reviews, and inspections focuses the most on the things that are most important to our strategic goals.
24. Our performance review results are linked to how well we support the strategic goals.

Strategy ⇒ Systems/Structure Alignment

Dimension Definition: Characteristics, processes, and practices that make all elements of the organization work in cooperation to achieve strategic goals and objectives. This includes organizational structure, work and decision processes, information flows, and development of capabilities.

25. Our processes, procedures, and systems were designed to help us achieve our strategic goals.
26. Our different departments, groups, and teams are organized in a way that makes sense for our strategy.
27. We routinely identify and remove barriers to achievement of strategic goals.
28. Our teams and departments work toward common goals, and not at cross-purposes.
29. Our processes and systems keep us focused on our strategic goals.
30. Our human resource, finance, and equipment acquisition activities are focused on efforts that will help us achieve our strategy.
31. Our information collection and distribution systems help us make decisions that support our strategic goals.
32. Our budgets reflect our strategic priorities.

Within Strategy Alignment (goals ⇒ deployment)

Dimension Definition: Characteristics, processes, and practices that make sure that the strategy is known, accepted, and supported by subgoals that contribute to achievement of the strategic goals at every level of the organization.

33. Department and team goals contribute directly to our strategic goals.
34. People seem to understand the direction and goals of the organization.
35. People get feedback about the organization's progress toward strategic goals.
36. Leaders frequently communicate with employees about where the organization is headed and how they can help achieve the goals.
37. Each team or department has action-oriented goals that support the overall strategy.
38. People understand how their work will help the organization achieve its strategic goals.
39. Leaders spend most of their time working on tasks that are important to the strategy.
40. People understand the strategy well enough that they can work toward its intent even when there is no clear direction.

Within Systems Alignment (overall purpose ⇒ components)

Dimension Definition: Characteristics, processes, and practices that make sure that key systems, processes, and activities are supported by component systems, processes, and activities that contribute to achievement of the strategic goals at every level of the organization.

41. The day to day details of our jobs and processes work together efficiently to support our strategy.
42. When we spend money on people, equipment, or process improvement, we make sure that the activity supports our strategic goals.
43. We can do our work without conflicts between work processes, systems, or departments.
44. Each process or system we have has a clear purpose.
45. Each system or process does what it is supposed to do efficiently.
46. Our jobs are designed so that everyone can help the organization achieve its strategic goals by doing his or her regular job.
47. Our systems and processes are flexible enough to respond to change.
48. Teams and departments in the organization work together without competition.

This paper describes and analyzes how one HRD program transcended the walls of the academic silos of a graduate school of business and a college of education and rewrote itself anew in a postmodern world. The purpose of the study was to identify what contributed to and what worked against the establishment of the joint program and to build theory about the postmodern skill of collaborating across boundaries.

Keywords: HRD Programs, Postmodernit

Academic HRD is a field that has never been solidly situated in the modern world. If modernity means clearly bounded, rationally and hierarchically ordered, and based on unitary scientific "truths," then HRD was definitely a field ahead of its time. It spanned disciplinary and professional education boundaries in universities, sought to establish an equal partnership between theory and practice, and was sabotaged in any efforts at enshrining truths by its own diversity of interests and membership.

Although probably unaware of its emerging identity at the time, the "edginess" of HRD reflected its uncomfortable position as a postmodern field. Faculty and students who have struggled to find and maintain a place for their HRD programs in universities characterized by entrenched and heavily bounded academic and resource silos might go so far as to say that postmodern position exceeded uncomfortable and gravitated toward pain. Milan Kundera captures the pain of living on the boundaries in the title of his book The Unbearable Lightness of Being (1984).

According to William Berquist (1993), the pressing themes of postmodernism are constructivism, language as reality, globalism, and segmentalism. He goes on to write that it is "virtually impossible to make a definitive statement about our contemporary world because this world is filled with contradictions and discrepancies...a fragmented and inconsistent postmodern world (p. 32). For academic HRD, these themes are present in its constantly changing definition of itself, its vulnerability (shared often with management) to the "fad of the day," the necessity to address the issues organizations whose allegiance transcends national boundaries, the challenges of a multinational labor force, and the difficulty of wrapping the field up in one neat and unchanging package.

This paper tells the story of the transformation, explains the research methodology, identifies major themes, notes some of the inhibitors to the collaboration, reviews existing literature on institutional collaboration, and suggests a theoretical perspective.

The Story

In the mid-1990's, one of the largest and best known academic HRD programs in the country nearly disappeared. It had lost one of its three faculty, a very visible and well-known scholar in the field. One of the other faculty was under extreme personal stress and the other was as yet, untenured. Most of its resources had been taken over by the department and college and as part of the take over of a designated scholarship fund, its doctoral program had been "put on hold."

In the midst of this demise, a group of adult doctoral students from the program arranged a meeting with the university's president and argued on the program's behalf, explaining what a difference it had made in their lives and in their work in organizations. The university's president and the provost at the time told the graduate dean and vice president for graduate studies that they could see no reason to abolish the program and that they would turn it over to her to handle in whatever way she wished. She chose to save the program by placing it under executive education in the Graduate School of Business and making it a collaborative program between the Graduate School of Business (GSB) and the College of Education (CE).

The relevant deans met and agreed on the financial arrangements. The GSB would capitalize the program and after they had been repaid, the two colleges would split the profits on the basis of the number of courses they

Copyright © 1999 Ann K. Brooks, Kathleen Edwards, Alison Davis-Blake

provided for the program. The program would be at the masters level as were other academic programs under executive education. The relevant department chairs and faculty from each college were called together for a meeting chaired by the dean of executive education. The chairs had already agreed to the arrangement in principle and the next step was for faculty from both colleges to agree to develop the program. After a few weeks, an associate professor from GSB and an associate professor from CE agreed to develop the program. The Dean of Executive Education appointed them as co-directors for the program.

These meetings took place in the early Fall of 1995. Faculty then initiated a day long retreat to address the unease that had been expressed by both partners regarding the values and culture of the other. Out of that meeting came a consensus that the program would be run on a cohort basis, intra-cohort competition would be discouraged, grading standards would be high, the program would be transformative, and the program would require students to do assignments in their workplace based on what they were learning in class. Later meetings mapped out a content curriculum that included human resource development, human resource management, and business. Conceptually, the curriculum focused the first year on HRD as a strategic partner and the second on the role of HRD in globalization. In terms of skills, students learned interpersonal, change, HR, and business skills. Structurally, the program consisted of an initial week-long executive seminar during August focused on strategy, two semesters, a week-long seminar during the next August focused on globalization, two semesters, and a final action learning experience in Australia (Brooks, 1998).

Marketing began in earnest during the spring of 1996. Brochures and flyers were printed and relevant business, government and professional organizations were contacted. Students from the previous program played an instrumental role in marketing the new program by sharing with prospective students how the original program had changed their lives. By summer, students were still being recruited for the program with the last student accepted into the program only the day before the executive seminar was to begin.

Initially, students in the program received their degree in the College of Education. However, after the program was approved by the legislature and the Graduate Assembly had granted tentative approval for it to go ahead, the Graduate School of Business pushed the Higher Education Coordinating Board to grant the program its own degree. The program was christened the Masters in Human Resources Development Leadership Program (MHRDL), and assigned the prerogative to have its own graduate advisor and graduate studies committee. The GSB oversees all marketing and financial matters. Permanent staff and faculty for the program include a full-time administrative assistant, a program facilitator, and two co-directors. In the spring of 1999, the program will present its accomplishments before the Graduate Assembly of the university for final approval as a permanent graduate level program.

The program graduated one cohort in May 1998 and has two cohorts in-progress. Initial class sizes have ranged from 21 to 30 students. Students must have five years work experience to qualify for the program. They must currently be working in the field of (or be anticipating a shift to) HRD.

Methodology

This research addressed the question of how a particular HRD program was established as a collaborative project between a graduate school of business and a college of education. The purposes of the research were to identify the factors that contributed to and worked against the program's development and to contribute to theory on institutional collaborations.

The assumptions on which this study is based are those hermeneutics. In other words, the data represents different perspectives and has gone through several intersubjective interpretations prior to appearing on this page. Through the process of interviewing and conversation, the stories told by those involved have developed and changed. Thus, the paper is a hermeneutic reconstruction of the interplay of all of those stories, both written and unwritten, in the creative minds of the authors.

Data collected included formal interviews, informal conversation and interviews, observation, and documents. The administrative faculty member conducted formal interviews with the Vice President and Dean of Graduate Studies, the Dean of Executive Education, the two co-directors, the Program Facilitator and seventeen graduates of the program.

One of the co-directors and the program facilitator analyzed the data through a process by which the co-director interviewed the facilitator regarding the following questions: (1) what surprised her the most? (2) what was the thematic story told by each of the interviewees? (3) what factors seemed to inhibit the development of the program? (4) what factors seemed to work on the program's behalf? (5) what motivated each of the major players in initiating and developing the program?

One of the three research collaborators wrote the paper. The others contributed through critical and creative reading. Thus, the actual written product is a joint construction of all three collaborators.

Validity is conceptualized in hermeneutic terms as the situated negotiation of meaning by all who participated in the research project, whether as the research population or as the researchers.

Thematic Analysis

This collaborative program was born of a confluence of events and people that enabled a quick and successful startup. Only one year passed from the time the Vice President and Dean of Graduate Studies initiated the discussions with the two deans of the colleges and the beginning of the first cohort's first executive seminar. The particular milieu that made this development possible included a favorable political and social context, the ability to capitalize on diversity, key players with strong personal motivations, and the cultivation and maintenance of interpersonal relationships and communication.

Political and Social Context

The development of the program took place within a national controversy over the appropriate role of higher education. The "ivory tower" was under assault by those who believed universities had become too isolated and out of touch with their communities' needs. Student demographics were changing from predominantly 18 to 21 year olds to older returning students. The national agenda had begun to focus on preparing people for the workforce and communities eager to attract industry were addressing the need to provide educated workers. Distance education was beginning to put a more competitive edge on education, throwing educators into the same competitive fray as other enterprises affected by global rather than just local competition. Information became more readily available to "everyman" through the Internet.

Within this context, universities seriously began to consider what role they would play in this changed world. The monopoly on information no longer conveyed a privileged status. The perceived privileged life of tenured professors was beginning to grate on state legislators who answered to a constituency of workers being asked to put in longer and more intense work hours with little increase in reward. Finally, many state universities were experiencing cuts in funding that increasingly was shifting the burden of financing higher education to the universities themselves.

All of these factors combined to set the right conditions for a program such as the MHRDL Program to be initiated. The Vice President and Dean of Graduate Studies comments on the particulars:

> We needed to not be just a 9-5 campus. Berdahl was expanding Continuing Education opportunities to the community. We were looking at ways to serve more students without burning out faculty...I frequently introduce myself now as the dean of the largest public graduate school and the dean of the smallest private graduate school.

The Dean of Executive Education was in agreement:

> The university needed to be able to demonstrate that it could reach across borders and also reach into the community. Hands across the water if you will...We were considered somewhat inaccessible to the community.

The Vice President and Dean of Graduate Studies was also looking for ways to expand the vision and involvement of the two colleges in areas they traditionally had excluded from their activities:

> Business needs to be more involved in public enterprise. Education needs to be more involved in private education. We need to be part of the national debate on these issues.

The program was birthed in a time of change. The opportunity was available and the time was right to build something new. A program that addressed community needs, crossed internal university boundaries, produced revenue, and existed outside of the constricts of traditional education was an ideal innovation for the time.

Capitalizing on Diversity

While the cultural differences of the two colleges at first seemed to be most salient, they were not the challenge the key players had expected. A number of other differences were equally or more important and needed to be negotiated throughout the process.

"Many layers of collaboration"

Much of the literature on collaboration address the issue of the merging of cultures. In fact, organizational culture has become an important construct in organizational theory. However, one of the surprises about the collaboration was that the expected cultural tension did not seem to be as troublesome as anticipated.

> While some members of both groups did indeed hold the conventional stereotypes of business as "hard" and interested primarily in money and education as "soft" and no academically rigorous, those perceptions did not seem to impede the progress of the program in any significant way. *Program Facilitator*

> It wasn't really harder to do intercollege collaboration because that issue was surfaced early on as this huge thing which I think actually turned out, while, an issue, turned out to be of lesser import than was initially identified. *GSB Co-director*

> There are many layers of collaboration in here and only one was made explicitly, which is two colleges with two different cultures. Which actually in some ways was the easiest and most visible and the most well understood at a coarse and cursory level. *GSB Co-director*

> One of the things it was clear was going on in the [first] meeting was all faculty were looking at each other and trying to decide, "Can I work with this person?" Because to form a collaboration of this nature, which is complex and difficult to get up and running from ground zero, you have to be sure that, first of all, the other person's going to carry their fair share of the burden. And second of all, that you have something of the same vision so you're not working at cross purposes with each other. *CE Co-director*

> One of the most fascinating factors that struck me was that the initial players were frequently more worried about working with the others within their own college than they were working with the people across colleges. The political, personal, and professional relationships seemed much more important on an "intra" level than they were at an "inter" level. *Program Facilitator*

However, because of initial anticipation of cultural problems, the faculty initiated a retreat for the faculty and administrative players from the two colleges. How important this retreat was for getting the collaboration off on the right foot is unclear.

> We scheduled a meeting with an outside facilitator and facilitated what we might call a visioning exercise, but really had more to do with almost a merger in a sense. Because that's really what we were doing was merging. We set it up basically so that what we were doing was trying to look at what strengths did we think each of us brought and how could we make sure that what we did would not lose the strengths from either the GSB or the College of Ed. The idea was to build on strengths rather than focus on disagreements. *CE Co-director*

> What I recall from that meeting was to me it was critical and not critical. Here's how I can say both of those things at the same time. It was critical in that there was an establishing of some sort of shared destiny. Some sort of subtle feeling was created although there was no agreement on anything substantive. Which is why I say it was critical yet non-critical. *GSB Co-director*

"Collaboration as a Bouquet of Flowers."

Perceptions of the collaborative experience. Key players each viewed the collaboration in a different light. The vice president and dean of graduate studies held the vision for the collaboration when she said, "I think of collaboration as a bouquet of flowers. You want different flowers in the bouquet."

However the differences could be trying at times. In the words of one of the co-directors,

> It's like having kids. It really is a very good analogy. In retrospect, I'm very glad I did it. But I didn't have any idea of the full magnitude of what that would involve...You don't think about the fact that you're only getting three hours of sleep a night. You just do it. You mjust kind of go through it. So once those processes were set in motion, each of them had their own momentum. *GSB Co-director*

Nevertheless, all of the key players voiced admiration for what the other college and their faculty contributed and a belief that the program was far better as a result of the contributions from both sides.

> Actually, I have been stunned by the quality of what has evolved. It far exceeded either my vision or my expectation of what could come out of this collaboration. I knew the idea was good. I knew our partners were good. I just didn't know how well what we produced would exceed what either of us could do on our own. *CE Co-director*

> I think we have been able to bring together in the curriculum and in the pedagogy the best of both worlds. I think that really is a strength. We're able to deliver a broader range, teach a broader range of issues with a broader range of pedagogies than we could ever do with either side delivering on their own. I think we have a broader and better vision together. *GSB Co-director*

Strikingly, the two directors were very different in their strengths. Although this resulted in occasional tensions and misunderstandings on a day-to-day basis, the directors clearly respected the other's gifts.

> I don't know what would have happened without Alison's administrative skill. She made the program credible on an administrative level within the university and with students, and in a large bureaucracy such as a state university, these things are critical. She set up systems and made sure everything was done when it needed to be done. *CE Co-director*

> I trusted Annie's vision of the program. From the very first day, it was clear to me that at a big, overarching level, she had thought about this, she was able to articulate it. She knew where the thing needed to go at a big picture level. We weren't going to get anywhere without that. That was what we were going to sell. And that's what we were going to deliver once we sold it. Her vision was key. *GSB co-director*

The stylistic differences between the two directors and the disciplinary perspectives they represented were very evident to the students. None were surprised to see that on the Myers-Briggs Inventory all participants took at the beginning of the program that one preferred an extroverted/intuitive/feeling/perception style while the other preferred the opposite introverted/sensing/thinking/judgment style. However the result for everyone was that the challenges and benefits of difference were at once visible and open to discussion. One student described the dynamic in the following way:

> Annie and Alison couldn't be more different if they tried. Having one of them in the morning and the other in the afternoon is sometimes very disorienting. But on the other hand you can see how each of their strengths have been woven into the program. I for one certainly learn very different things from each one. *Student in first cohort*

Nevertheless, building a commonality between members of two different colleges geographically separated on campus did not come effortlessly. It took work. The dean of Executive Education was in a particularly good position to see some of the struggles with working across institutional cultures.

> We have to have enough of a common culture to tolerate each other's differences and to realize we're not going to see things eye to eye...We have to create our own mini-culture...to fill in the white space between the College of Education and the Graduate School of Business. It can be done if it's designed with respect and integrity... It takes conscious work. We have to let go of a lot. But the work is worth doing. *Dean of Executive Education*

Unexpected Cultural Differences

In addition to the intercollege differences and the individual stylistic differences that distinguished the two directors, demographic differences in age, gender, rank, and point of view at times caused misunderstandings. Similarly, differences emerged between people in the same department who had not necessarily worked together before and so were unfamiliar with and did not necessarily trust each other; groups that appeared homogeneous because they were in the same department were at times composed of strangers with little in common. Within colleges, interdepartmental but intracollege differences emerged. This kind of diversity is exemplified by the large amount of time the GSB co-director spent working with the Accounting Department and faculty in developing a course that was suitable for non-business and accounting majors. Additionally, faculty and administrators worked from differing role perspectives, and this at times created tension.

Strong Personal Motivation

Although this research focuses on five key players in launching the program, interviews revealed that those who contributed far exceeded that number. Most of those contributors have receded into the history of the program. However, the interviews revealed that motivations were diverse. For example, the Dean of Executive Education saw the joint program as an opportunity to "capture" surplus consumer dollars:

> The legislature votes a degree of subsidy from tax dollars...Populism is very high in this state. That means when you subsidize, you subsidize tuition, etc. We're leaving considerable money on the table in that many families could afford to pay more. It's a consumer surplus...When MHRDL came along, I saw it as an opportunity to capture some of the surplus.

The Vice President and Dean of Graduate Studies was more interested in developing ways in which the university could extend its expertise to serve the community:

> It's important to help corporations with their training and development. If we do not do it, they will do it themselves with less quality. Hamburger University, if you will...We have the strengths here. Intellectually, it is important that kind of learning has a research base...There is a need for renewal of people in organizations. Our HRD students should lead that.

The two co-directors spoke more of the opportunity to offer a better quality of direct service.

> I was teaching general courses in the MBA core. This was a chance to change my teaching assignments to my specialty. It was a change to teach something I would like to teach with an audience I thought I would have a very good rapport with. *GSB Co-director*

> To be perfectly honest, I was very tempted NOT to sign on to build this program. I was tired from having just been tenured and beaten by the struggle to stop the demise of the original program. But I guess I saw a lot of support from current and past students and heard them talk about what their experience in that program had meant to them. That was hard to ignore. I also knew that the program would be enormously enhanced by being able to integrate human resource management and business skills. The field of HRD was changing and this looked like an opportunity to change the program to address those changes. *CE Co-director*

Interpersonal Relationships and Communication

The founders of the program recognized from the beginning that communication and trust were going to be crucial to the success of this collaborative program. The first hiring decision the co-directors made was to employ a program facilitator who could span the boundaries of the collaboration and who could serve as an interpersonal

interface among faculty, staff, and students. The Dean of Executive Education referred to the need to fill in the "white space" between all of the players. The co-directors also had a sense that this role would be important, particularly in the absence of any formal organizational structure of authority.

> I knew from my own organizational experiences that interpersonal relations were not going to be easy in this situation. But I'm still always surprised at the extent to which those sorts of things can make or break a program. The fact that we hired someone who could play sort of an organizational development role between the two colleges and the two co-directors and facilitate a climate of open communication rather than letting minunderstanding go was absolutely essential. *CE Co-director*

> The Program Facilitator's role was pivotal to the program. A lot of gaps between dyads or in groups needed to be bridged that couldn't by the people involved at the moment it was needed...Kathy was able to do that. She was able to step in and fill the holes. *GSB Co-director*

> I think of my facilitative role as that of a border crosser. I try to understand what everone involved is thinking and feeling and to make sure we create space along the way to notice and negotiate any bumps on the road. *Program Facilitator*

Because no legitimate authority cuts cleanly across all of the boundaries in the collaboration, expertise and knowledge were difficult to identify and agree upon. Without traditional methods of resolving these differences, interpersonal trust became critical. Authority based on expertise are insufficient to overcome these differences. Trust had to be developed individually in the context of specific relationships.

Literature and Theory

Although employees in organizations are increasingly being asked to collaborate with colleagues across boundaries previously left inviolate, little research has been carried out on the subject. If the theoretical literature on postmodern organizations is reflective of some significant dimension of reality, then work in this area would be beneficial to many.

Literature

Existing research points at collaboration as a tool for innovation. The theoretical perspective for this has predominantly been that of knowledge creation, use, and distribution. For example, emphasizing the contribution collaboration makes to innovation, Goes & Park (1997) tentatively concluded based on a study of 400 California hospitals over 10 years, that cooperative relationships among distinct and related organizations were believed to enhance innovation. In particular, structural, institutional and resource-based links were all related to innovation in hospital services and technology. Other research has suggested that collaboration increases the quality of strategic decisions (Lessard, 1994). Other research utilizes the constructivist frame of organizations as systems of distributed knowledge for studies or discussions of the importance of moving across traditional boundaries in organizations (Brooks, 1994; Tsoukas, 1996). Finally, several researchers or theorists link cross-boundary collaborations to enhanced organizational learning (Richter & Vettle, 199X; Steensma, 1996; LeRoy & Ramanantsoa, 1997; Harvey, Palmer & Speir, 1998; Martiny, 1998; Kilmann & Kilmann, 1995).

Theory

Using Corbin & Strauss' (1990) strategies for grounded theory, two of the researchers asked themselves what seemed out most importantly to stand from the study regarding the question of what made the collaboration work. Both researchers were struck by the role interpersonal relationships played in making the program a reality. To integrate knowledge and interpersonal relationships requires a shift away from the economic conceptualization of knowledge as a commodity present in much of the research literature on collaboration and a shift toward knowledge as three tiered: (1) my knowledge, (2) my culture's knowledge, (3) and technical knowledge.

The creative production of new knowledge comes from the intersubjective negotiation of what is true and reasonable. Thus, facilitating cross-boundary collaborations in which both culture and interests are different seems to require attention to the dimensions of knowledge, the enabling of interpersonal relationships, and presence of a community in which the exchange of knowledge and opinions can freely occur. A university is in many ways

uniquely situated to produce unfathomable amounts of innovative new knowledge through the encouragement of collaboration. Distinctions are made among types of knowledge, faculty are free to move in time and space and cultivate relationships, and a sacred tradition of academic freedom guarantees the right to a community of freely exchanged knowledge and opinions.

Unfortunately, the historical norms present in much of industry whereby knowledge is often uncritically viewed as only technical, interpersonal relationships are limited by control of employees time and movement in space, and a unified culture is valued over diversity mitigate against the kind of innovation in knowledge to which universities can lay claim. Once any barriers were cleared in the central administration, collaboration on initiating the MHRDL Program was facilitated by the possession of valuable knowledge by both parties, the tradition in universities for faculty to move across boundaries of time and space, and the protection of free speech. However, because authority based on expertise is insufficient to overcome differences and because no legitimate authority cut cleanly across all of the boundaries involved, the development and maintenance of trust and interpersonal relationships were critical.

Conclusion

Tsoukas (1996) and Brooks (1994) have both argued that organizations are systems of distributed knowledge. Tsoukas, drawing on interpretive philosophy, ethnomethodology, Bourdieu's sociology, and discursive psychology, has gone on to assert that this means they are decentered and without an omnipotent "mind." This means that the organizational problem facing firms is the use of knowledge which is not and cannot be recognized through only one agent. No single agent can determine prematurely what kind of practical knowledge will be pertinent when relevant and where important. Knowledge of a firm cannot be monitored wholly and is not self-contained. It is innately indecipherable and endlessly shifting.

As organizations are increasingly faced with the unpredictability and fragmentation of a postmodern world, collaborations are becoming ever more common as a way of augmenting to address new challenges. The MHRDL program was begun on the foundation of an earlier program and drew on relationships and knowledge sources that themselves were unpredictable and fragmented. Although upper management enabled and advocated for the program, no one could have rationally planned and implemented a blueprint for its realization. Rather it was the multiple types of knowledge, the freedom to develop formal and informal human relationships in the workplace, and the long tradition of a community of that enabled the multiple parties both within and outside of the organization to contribute their knowledge to the program's success.

An Examination of Teaching Pedagogies in Entrepreneurial Education, a Historical Examination

Ayman Tarabishy
Erik K. Winslow,.
George T. Solomon,
The George Washington University

This paper discusses some of the results of the 1997 national Survey of Entrepreneurial Education and compares the findings to four earlier national surveys conducted from 1979-1992. The results of the data, based on earlier surveys, indicate a trend toward greater integration of practical applications and technology into the teaching pedagogy of entrepreneurial education. The 1997 survey shows similar trends.

Keywords: Entrepreneurial Education, Pedagogy, Small Business Management Skills

In 1997, The George Washington University's School of Business and Public Management conducted the " The National Survey of Entrepreneurial Education ". The survey offered the academic field of small business management and entrepreneurial education an opportunity to present its new and expanded role in the teaching of small business and free enterprise to a generation of new and prospective entrepreneurs and students, both in the United States and internationally.

This paper will first provide the reader with background literature in the field of small business management and entrepreneurial education and some of the major differences and similarities between them. Next, there will be an examination of course structures and pedagogies in small business management and entrepreneurial education. The paper will then provide the results of the 1997 National Survey reflecting the "current state" of entrepreneurship and small business management education.

Literature Review

Growth in Small Business Management and Entrepreneurship Courses

Since the late 1960's, entrepreneurship education has been spreading around the world at an ever increasing pace (Vesper, 1985). Applied education in entrepreneurship can be traced as far back as 1938, to Shigeru Fujii, Professor Emeritus, Kobe University, Japan (McMullan and Long, 1987). Grant Moon of the U.S. Small Business Administration reported that prior to 1953, only the University of Illinois offered a course in "small business or entrepreneurship development" in the United States (McMullan and Long, 1987). In 1958, Dwight Baumann, an engineering professor at MIT, introduced what may have been the first course in entrepreneurship in the United States (McMullan and Long, 1987).

Sexton and Bowman (1984) reason that both government emphasis on small business development and prevailing economic conditions were playing a crucial role in the expansion of small business management and entrepreneurial course offerings. Plaschka & Welsch, (1990) also indicated that, a parallel was discovered in the rapid growth of small business management courses with the rapid growth of small businesses in the United States.

Most fundamentally, the growth in these types of courses may be influenced by the fact that teachers and students both enjoy them (Vesper, 1987; Vesper & McMullan, 1988). Though course offerings were increasing in number, demand for small business management and entrepreneurship courses was growing at an even greater rate (Vesper & McMullan, 1988), in part because student demand was high (Fernald & Solomon, 1993).

In order to understand both the growth of small business management and entrepreneurship courses, it is important to establish a conceptual difference between these two educational types-a differentiation that, too often, the literature fails to make (Zeithaml & Rice, 1987).

Differences between Small Business Management and Entrepreneurship Courses

In attempting to distinguish differences between small business management and entrepreneurship courses, however, one should perhaps not overlook their similarities. The focus of both small business management and entrepreneurship education programs are to provide a breadth of creative managerial skills and knowledge that is the "closest approach to the original concept of professional management education offered at colleges and universities" (Zeithaml & Rice, 1987). Most often, courses in both areas tend to focus on the total firm. They provide coverage of the problems involved in planning, implementing and operating a small business for managers and owners, in regard to how to start-up a business and how to conduct ongoing activities.

Small business courses at the post-secondary level were first established in the 1940's (Sexton & Bowman, 1984) and dealt primarily with the managing and operating of small, existing companies. Entrepreneurship courses, which first emerged as academic offerings in the 1960's, had as their major focus, the activities involved in originating and developing new growth ventures (Guglielmino & Klatt, 1993; Marchigiano-Monroy, 1993). The conceptual difference is often blurred in both the academic and real worlds. Generally, small business management covers considerable information on how to successfully manage the business in order to expect normal sales, profits and growth. This includes coverage of planning and organizing the business, selecting and leading employees, business operations, marketing goods and services and financial planning and control. On the other hand, entrepreneurship courses emphasize information in which the principle objectives of the entrepreneur are profitability and growth. Entrepreneurs are usually seeking rapid growth, immediate and high profits and a possible quick sellout with a large capital gain.

In summary, teaching entrepreneurial skills and desired learning objectives of the two educational types, small business management and entrepreneurship are in fact different. The traditional objectives of small business management programs have been to provide students with management "know-how" relating to "setting goals and objectives, leading, planning, organizing, and controlling from a small business perspective" (Fernald & Solomon, 1993, p. 103). Entrepreneurial education has had as its focus an action orientation primarily embodied in teaching students how to develop a business plan (Ronstadt, 1985).

Course Structure and Pedagogies

Existing Pedagogical Approaches

Given there is reasonable support for the need to provide small business management and entrepreneurship courses, the prevailing issue is: what pedagogues are most appropriate for transferring entrepreneurial skills and knowledge?

Ronstadt (1985) characterizes the "old school" method toward small business and entrepreneurship education that:

> ...took an extreme, action-oriented approach to the subject. The motto of the old school was decidedly "go out and do it now". The business plan served as the academic heart of these courses. The rest of the curriculum was provided by experienced visitors who provided interesting stories, practical advice, and inspirational motivation (p. 23).

Other teaching methods described included literature reviews, interviewing of entrepreneurs, working with a start-up entrepreneur or the start-up of a small-scale business by a class. A survey conducted by Ahiarah (1989) revealed that the most used pedagogical tool for teaching small business management and entrepreneurship was a combination of lectures and cases. The second most used tool was special projects, which include live cases or case formulations. Other assignments included oral and written presentations, guest lectures, business plan preparations, and the use of films and videos. It is interesting that both Hills (1988) and Ahiarah (1989) found that assigned readings were the least preferred method.

Emerging Pedagogical Approaches

The "old school" as described by Ronstadt (1987) was beginning to give way to new methods of teaching small business and entrepreneurial skills. These new methods were arising from an increased understanding of entrepreneurship (Ronstadt, 1987) and a better understanding of entrepreneurship students. Porter and McKibbin (1988) have suggested that entrepreneurship education is moving towards integrative, comprehensive, and holistic programs. Sexton and Upton (1987) have proposed structuring courses around the psychological needs of entrepreneurship students. They conclude from their research that:

> entrepreneurship students can be depicted as independent individuals who dislike restraint, restriction, and the routine. They are capable of original thought, especially under conditions of ambiguity and uncertainty. Many of them need to develop better communication skills and to become more aware of how others perceive their behavior (Sexton & Upton, 1987, p. 38)

These conclusions lead Sexton and Upton (1987) to propose those courses should be relatively unstructured and "pose problems which require novel solutions under conditions of ambiguity and risk". Additionally, an increasing awareness of the special needs of adult students (Weinrauch, 1984) and minority students (Mann, 1990) is leading to an assessment of how small business management and entrepreneurship can best be taught.

Survey Methodology

The George Washington University developed a survey to examine the current state of entrepreneurial education in the United States. The survey developed was based on similar surveys used in 1979-1992. Minor changes were made to further track any new teaching trends and any new courses being offered. The survey was sent out to two-year community and junior colleges, four-year colleges and universities and international universities and colleges. The survey asked the educational entities if they offered small business and entrepreneurial educational programs. Also, the survey examined the extent and breadth of courses, seminars and workshops being offered existing and new. Finally the survey examined the teaching methods and trends used in the courses, seminars and workshops being offered. A copy of the questionnaire can be found at http:// www.gwu.edu/~nes.

An analysis of the data from our surveys, relative to the teaching and evaluation pedagogies employed by two- and four-year colleges, universities and international colleges in regard to course and seminar offerings in small business management and entrepreneurial education, is the focus of this next section.

Findings

For Table 1., the 1997 data indicate what teaching methods were offered. They include: (1) case studies (2) lectures of business owners development of business plans; (3) guest speakers; (4) research projects; (5) community development; (6) on site visits; (7) creation of business plans; (8) discussions; (9) small business institute counseling (10) feasibility studies (11) internships. The data indicate that the major evaluation pedagogy for all educational institutions surveyed was 1) Creation of business plans (87%), 2) Case studies (78%) and 3) Guest Speakers (69%).

For Table 2., the 1997 survey also inquired about the most popular courses being offered. For 2-Year Colleges, Small Business Management was the most popular course followed by Small Business Finance followed by New Venture Creation. For 4-Year Universities, New Venture Creation was the most popular course followed by Small Business Management and then Small Business Consulting. For 4 year colleges, New Venture Creation was the most popular course followed by Family-Owned Business and then by Small Business Finance. For International Colleges and Universities most popular course was New Venture Creation followed by Small Business Management and then Small Business Consulting.

Discussion of Results

To further understand the results of our survey, we examined the data from four historical surveys on small business management and entrepreneurial education (George Solomon,). The results of past surveys indicated a similar growth pattern in small business management and entrepreneurship course offerings.

For Table 3., the historical data (1979-1992) indicated that for 2-year colleges, the major evaluation pedagogy for the entire length of study were tests (41%). However, cases (19%) and business plans (17%) were becoming more widely used as evaluation pedagogy in both the small business management and entrepreneurship.

The historical data also indicate that for four-year colleges and universities, the number one choice as evaluation pedagogy for the entire length of the study were tests (26%). However, business plans (20%) and Small Business

Institute consulting (19%) and cases (16%) closely followed as preferred evaluation pedagogies. Therefore, both the 2 and 4-year colleges and universities preferred the test format as the evaluation pedagogy.

Conclusion

Our 1997 survey indicates that the trend discovered in the 1977-1992 surveys have continued in a similar manner. The data also indicated that experiential teaching and evaluation pedagogies are increasingly being employed. The growth of small business management and entrepreneurship courses is an academic phenomenon, which is not likely to dissipate soon. More importantly, given the rise in course offerings, endowed chairs, majors and research, it is important not to lose sight of the uniqueness of the phenomenon under discussion and investigation -- the entrepreneur and small business manager/owner.

We believe based on the data presented in this paper, that there is a need to abandon more traditional forms of teaching and evaluation methods for more unique, unconventional ones. This opens the door for new paradigms of teaching and learning. Self-directed learning methods may help answer the growing needs of students by having personalized projects such as creating a business plan as their primary evaluation pedagogy. If the students are moving away from tests and favoring 'project' centered educational techniques, it makes sense to create a class environment that facilitates it.

Another consideration to be taken into account is to start applying technology in entrepreneurship and small business courses. As colleges and universities are beginning to realize that long distance learning is an integral part of learning, entrepreneurship and small business courses need to capitalize on this opportunity. The Internet is playing a major role in allowing this new type of education to take place.

Given the trends to date, it is hoped that educators and trainers will continue to move toward more unconventional, experiential-based teaching and evaluation methods. Traditional paradigms will not work when the focus of the learning is to broaden horizons and perceptions and, in fact, move individuals to a different plane of thinking and action where the focus is for them to become "Paradigm Pioneers" and to blaze new trails for others to follow.

Examination of Critical Issues for Development and Implementation of Online Instruction

Scott D. Johnson
Nilda Palma-Rivas
Chanidprapa Suriya
Steve Downey
University of Illinois at Urbana-Champaign

This descriptive and exploratory study examined several critical issues affecting the development and implementation of online instructional programs. The intent of the study was to (a) help online program instructors, administrators, instructional designers, and technology developers understand the unique challenges and opportunities presented by online instruction; and (b) expand the base of knowledge regarding this new form of instructional delivery. The study has direct implications for online program development in HRD.

Keywords: Distance Learning, Online Instruction, Instructional Design

A primary goal of university level Human Resource Development (HRD) programs is to prepare professionals for leadership roles in HRD. HRD units in corporate America are responsible for employee training and professional development, with billions of dollars spent each year on education and training services. The importance of HRD has heightened in recent years due to technological advances in the workplace, concerns about the quality of education possessed by entry level employees, and the change toward more participatory organization structures and management practices. Efficient and effective training and development of the workforce is critical for helping corporations of all sizes adapt to change and remain competitive. Consequently, demand is high for well-trained HRD professionals who can effectively manage a wide variety of HRD roles and functions.

As the importance of private sector training continues to grow, a parallel growth in the need for professional development opportunities is evident. While most university HRD programs offer master and doctoral degrees in HRD through on-campus programs and traditional off-campus delivery means (e.g., distance education using television or audiographic systems), there is an increasing need to reach prospective students who are unable to commute to campus or participate in traditional remote offerings. To better serve the large numbers of working HRD professionals who desire professional development and advanced degrees, graduate programs are starting to create Internet-based courses that reach the widely distributed off-campus audiences not being served through traditional delivery methods.

Numerous issues must be addressed when developing and implementing online instructional programs. Some of these issues include factors that directly affect learner performance such as the knowledge and skills one brings to the instructional environment and the technologies used to deliver and support the instruction (Rothwell & Kazanas, 1998). Other issues of equal importance are the need to develop faculty skills in instructional design and technology use (Threlkeld & Brzoska, 1994; Willis, 1994), providing instructional technology training for the students who enroll in online programs (Willis, 1993), and establishing a technical support system to address the needs of both the instructors and the students (Willis, 1993, 1994).

Problem Statement

Although online instruction is gaining prominence in the delivery of advanced HRD degrees, little theoretical or empirical research has examined the critical issues affecting the development and implementation of online HRD graduate programs. To address this need, a descriptive and exploratory study of an online HRD Master degree program at a large Midwestern university was conducted in 1998. The purpose of this study was to (a) help online program instructors, administrators, instructional designers, and technology developers understand the unique challenges and opportunities presented by online instruction; and (b) expand the body of knowledge regarding this new form of instructional delivery.

Research Questions

The following questions guided this examination of critical issues for online instructional development and implementation:

- What technologies are used for online instruction?
- What technical knowledge and skills are needed by students, instructors, and program developers to successfully participate in online programs?
- What training is needed by students and instructors before and during their participation in online programs?
- What are the technical support needs and requirements of online programs?

Review of Literature

Rapid developments in information technology have made possible a new method of distance education called *online instruction*. Online instruction can be defined as an innovative type of instruction that is delivered to remote audiences over the Internet (Khan, 1997). The Internet provides an opportunity to develop new learning experiences that were not possible previously (Alexander, 1995). One of the advantages of online instruction is that information/content can be delivered to any computer that has access to the Internet, anywhere and at any time. Harasim (1989) argues that online education is more than a new delivery mode. It is a learning domain that enables learners to engage in learning interactions more easily, more often, and perhaps more effectively, but also results in qualitatively new and different forms of educational interactions (p. 62). Even though online instruction is being rapidly adopted by many educational institutions and businesses to deliver instruction (ASTD, 1997), little is known about the critical issues that affect the development and implementation of online graduate programs. From the program developers perspective, a new understanding of these issues is critical for the development and implementation of quality online instruction.

One important area of online development and implementation neglected by research is the degree of technical knowledge, skills, resources, and support needed by students, instructors, and program developers. Even though technology is becoming very popular, the use of computers for instructional purposes is still not widespread and the lack of knowledge and skills in relation to hardware and software issues can create much frustration (Hill, 1997). The lack of knowledge and skills for online participation and development leads to the need for training. In this respect, the training of students and instructors has received some attention from researchers. Instructors must be trained, not only to use the technologies, but also to apply the technologies to their instruction (Franklin, Yoakam, & Warren, 1996). Also, because technologies must be updated to capitalize on new capabilities, skills must also be systematically updated to maintain the user's ability to employ the evolving technologies. Franklin, Yoakan, and Warren (1996) conclude that instructor development and training contributes more to an online system's success than any other factor. Beyond the instructors, the program developers and technical support staff also need to be well trained because the quality of an online program depends greatly on the expertise of the development team.

Methodology

This descriptive and exploratory study examined critical issues affecting the development and implementation of an online HRD masters degree program offered by a large Midwestern university. Started in June, 1998, the online program consists of a series of eight courses in human resource development and is being taught to a geographically dispersed cohort. The online graduate program was designed for individuals currently working in, or aspiring to, positions in human resource development.

Program Participants

A total of 23 individuals, mainly HRD professionals from corporations in the Chicago area, comprised the student body for this online cohort program. Though most students were from the Chicago area, one resided in Connecticut and a second was based in Georgia. Most students had considerable work experience in human resource development, with an average of over 4 years HRD-related employment. The participants had strong educational backgrounds with some of them pursuing their second masters degree. Demographically, the students were a very diverse group (i.e., 17 females/6 males; 5 minority students; age range from 25 to 50).

Data Collection and Analysis

A multi-method approach was used to identify issues affecting the development and implementation of online instruction. Data were gathered in this study using a wide range of methods including in-depth interviews, surveys, observations, and document analysis. Specific data sources included personal notes from participants, minutes and notes from project team meetings, and electronic data records (e.g., e-mail messages, WebBoard archives, IRC Chat logs, and synchronous activity logs).

Technology resource analysis. An examination of the technology resources required by online students featured analysis of hardware, software, and support systems necessary for participation in the program. The analysis of this area included a comprehensive "environmental scanning," a canvassing of comparative software reviews conducted by independent organizations, an inspection of computer system requirements for the software chosen for the online program, and testing of various hardware configurations to assess respective performance levels.

Technical knowledge and skill requirements. One goal of this study was to determine the technical knowledge and skills needed by instructors, program developers, and students who are involved with online instructional programs. To identify the technical knowledge and skills required by online instructors and program developers, two different methods were used: "environmental scanning" and in-depth open-ended interviews with key informants. Online programs identified through the environmental scanning were analyzed from a variety of perspectives, including the type of technology and communication tools used, instructional design approaches, synchronous and asynchronous activities, and course web design and navigation interfaces. Data regarding the knowledge and skills needed by instructors and program developers were supplemented with data obtained from open-ended interviews conducted with program participants, instructors, and developers.

Two methods were used to determine students' needs: observations and open-ended interviews. Three beta testers were observed while they navigated the course web site, completed exercises, and participated in synchronous and asynchronous activities. A checklist guided the observation process. This observation instrument was developed based on an in-depth analysis of the class web site and a list of tasks and procedures students would follow to participate in the online class. Once the beta testers finished reviewing the online course, they were interviewed to assess various aspects of their experience. Data from the observations and open-ended interviews revealed the knowledge and skills needed to successfully perform in the online program.

Training needs analysis. Structured surveys and document analysis were used to identify the training needs of students. The structured survey was used as a diagnostic tool that was completed by students prior to the start of the online class. Data from the structured survey of student training needs were analyzed using common statistical analysis. Documents collected during the program delivery were analyzed using a document analysis form. The researchers coded the related documents by relevant topic and different training needs. Observations and open-ended interviews were used to identify the training needs of the instructors. Specifically, the "participant as observer" approach was used (Creswell, 1994). Data revealing the training needs of instructors prior to and during the online delivery were obtained from observation notes kept by the researchers.

Technical support analysis. Strongly related to the analysis of technology resources is the technical support provided by the program. The difference in these variables, however, lies in the depth of analysis being conducted. During this phase of the study, the focus was on the forms of support services provided by the online program, how they were used by the stakeholders (e.g., toll free phone support, chat spaces, e-mail, Instant Messenger, personal visits, etc.), and the nature of the problems encountered (e.g., types of problems and their solutions). These data were in the form of descriptive narratives, frequency counts, recurring theme/category depictions, and frequency of occurrence mapping.

Results and Discussion

The results of this study are summarized in four sections that address critical issues for the development and implementation of online instructional programs. The issues deemed most critical include the technology resources used in online programs, the knowledge and skills needed to participate in online programs, training issues that need to be addressed by program developers, and the type of technical support that should be provided. Collectively, the following information can guide the development and implementation of online instructional programs.

Technology Resources Used in Online Programs

Appropriate technologies must be selected in order to achieve full and effective participation by online students and instructors. Based on a combination of (a) environmental scanning, (b) canvassing of software reviews, and (c) hardware requirement inspections and configuration tests, the following analysis identifies key technologies that support online program development and utilization.

A comprehensive analysis of online programs implemented by universities located in the United States and abroad was conducted. An analysis of over 150 online instructional programs and courses was carried out to identify common practices for course design and technology utilization. Based on this review, several conclusions can be made:

1. Email and web-based technologies form the core of most online courses.
2. Few online programs currently utilize audio and video conferencing technologies.
3. Few online programs use proprietary technologies in the delivery of their courses.
4. Most sites use technologies that conform to open industry standards (i.e., W3C standards).
5. On the minority of sites that utilized them, a blend of multimedia technologies were employed, such as streamed video clips and a modicum of animation and applets.

Once the basic technologies were identified from the environmental scanning, an analysis of independent software was conducted to determine the best software for utilizing these technologies. Based on that analysis, it was possible to conclude that the most applicable software for future online programs are:

- Eudora Pro 4.0 (e-mail)
- RealPlayer 5.0 (multimedia)
- Netscape 3.x or Internet Explorer 4.x (web browser)
- AOL Instant Messenger 2.0(paging/messenging)
- Winsock FTP LE 95 (file transfer)
- Microsoft Office 97 (production)
- Acrobat Reader 3.0 (document sharing)

To further identify technology resources appropriate for online programs, technology reviews in online and paper-based industry publications were examined. Several trends from these reviews were apparent:

1. With little surprise, industry standard software, such as Microsoft Office and Netscape's Communicator, are viewed as the best, or near the best, in their respective categories.
2. Cross-platform availability, reliability, cost, ease of use, and customizability are central factors common to most technology review/selections.
3. Compliance with accepted industry standards, accessibility support, and advanced features are occasional factors in the reviews.

Hardware configuration requirements. To ensure that students use computer systems capable of supporting the technologies selected for use with online programs, all technologies listed above were reviewed for hardware specification requirements. These requirements were developed based on tests using multiple hardware configurations to measure performance levels and to develop final recommendations and requirements. The minimum and recommended specifications for a Windows-based system are shown in Table 1.

Table 1
Minimum and Recommended Systems for Participation in Online Programs

Minimum Configuration	Recommended Configuration
• 486process running at 100 MHz	• Pentium 166 MHz Processor (or faster)
• 16MB RAM	• 32MB RAM
• 200MB available disk storage*	• 200MB available disk storage*
• 14.4 modem	• 28.8 modem
• 16-bit sound system	• 32-bit sound system
• 4x CD-ROM	• 12x CD-ROM

Note. * Storage space estimates the amount of space required to store all of the applications (Microsoft Office, etc.) and the work/data files generated by the students during the course of the program.

Technical Knowledge and Skills Needed to Participate in Online Instruction

Building on the technologies identified for online instruction, key informants, instructors, and program developers were interviewed to determine the knowledge and skills required to use the selected technologies to support their role as instructor, program developer, or learner. Also, three beta testers were observed and interviewed. Results are presented below in two parts: (a) the knowledge and skills required to develop and conduct online instruction and (b) the knowledge and skills required to participate in online programs.

Knowledge and skills required by developers and instructors. The development of online instruction requires that both the instructors and the program developers know basic operation of word processing and presentation software, multiple web browsers, and HTML editors. In addition, program developers need advanced knowledge and skills for creating multimedia files, to transfer files from development machines to servers and, for some online programs, the ability to design database systems using software such as ColdFusion or Microsoft Access. For synchronous activities, developers and instructors also need to be able to broadcast and archive live audio and use text chat to interact with students. Additional skills include the management of e-mail and threaded discussion group software as well as chat functions. Possessing the knowledge and skills needed to implement these functions are very important for program development, management, monitoring, and troubleshooting. Table 2 provides a summary of the specific knowledge and skills required by instructors and program developers, by phase and by application.

Knowledge and skills required to participate in online programs. Data from observations and open-ended interviews conducted with the three beta testers revealed that to fully participate in an online instructional program, including both synchronous and asynchronous sessions, students should have basic skills in using web browsers, threaded discussion groups, and e-mail applications. Table 3 presents a summary of the specific knowledge and skills needed to effectively participate in online delivery.

Training Needs of Online Students and Instructors

The following description of training needs of students and instructors was derived from data collected through use of a structured survey, interviews, and electronic data archives. In addition, numerous experiences were gained through the development and implementation of an online degree program in HRD over the past year. The following section identifies the training needed by both the students and the instructors of online programs.

Training needed by students. An analysis of the online students' technology resources and capabilities was conducted to determine if the students in the program had adequate computer resources and the skills needed to participate in online instruction. Based on this analysis, technology training was clearly the type of training most needed by the majority of the students. For example, most of the students did not have the skills necessary to download software from the Internet or use a Web Browser to conduct searches or install plug-ins to play multimedia files. Specifically, training was needed in advanced uses of web browsers and use of communication tools such as e-mail and WebBoard. In addition to providing training on the use of the new technologies for online instruction, the students needed to be trained to install software and troubleshoot problems when they occurred.

The necessary technology training was provided in several forms First, an orientation session was designed and implemented during the first class session. Computer applications and tools used for the online instruction were presented and explained in order to familiarize the students with the technology. Second, before the beginning of the course, the students were required to complete an orientation assignment located on the course web site. The assignment included tasks that helped the students gain the necessary skills needed to participate in the online class, such as sending e-mail attachments, posting messages in WebBoard, and listening to audio files. The third form of technology training involved hands-on practice with the specific technologies to be used by the students. Step-by-step explanations were integrated into the instruction early in the course and students were encouraged to practice using the new technology.

Technology training was perceived as a way to avoid frustration, wasted time, and potential dropouts. Technology training was also perceived as a critical event to be accomplished before presenting actual course content. Training is critical because the online students want to be confident in using technology before they engage in the learning the content. The students perceive technology training as a way to be better prepared to learn the content.

Training needed by instructors. The instructors and teaching assistants involved with the first two online courses in the program were asked to identify the type of training they needed prior to and during their participation in the online program. Different types of training needs were identified prior to the start of the online program, including (a) orientation training, (b) communication-skills training, and (c) technology usage training. The instructors indicated that if a good orientation training program was offered prior to the start of the online program, training during the courses would not be as necessary unless there are changes or updates in the technologies being used.

Table 2
Technology Knowledge and Skills Required by Program Developers and Instructors

Software Function	Software Applications	Specific Knowledge and Skill Requirements	
		Program Developers	Instructors
Document Creation	Word Processing	Create and format documents using tables and borders. Convert documents to HTML file	Create and format documents using tables and borders Convert documents to HTML file
	Presentation Software	Create instructor presentations, use templates, add clip art, print, and record narrations. Create presentations for use on the Internet	Create instructor presentations, use templates, add clip art, print, and record narrations. Create presentations for use on the Internet
WWW Access	Web Browser	View and navigate WWW, use search tools and bookmarks, use plug-in to play multimedia files, and download programs from Internet.	View and navigate WWW, use search tools and bookmarks, use plug-in to play multimedia files, and download programs from Internet.
Communication & Collaboration	E-mail	Create, forward, and reply to messages and send attachments. Sort incoming mail and create mailing lists	Create, forward, and reply to messages and send attachments. Sort incoming mail and create mailing lists
	WebBoard	Post, delete, and attach files to a message and participate in chat sessions	Post, delete, and attach files to a message and participate in chat sessions
	RealEncoder	Broadcast live audio and archive audio files	Broadcast live audio and archive audio files
Web Page Development	HTML editors	Create and edit Web pages. Use templates, forms, images, multimedia files, and advanced HTML tags	N/A
	Database	Write and test scripts to create and maintain online grade books	Provide grades and feedback and download students' assignments
	File Transfer	Upload and download files to the course server	N/A
Multimedia Development	PhotoShop	Create and edit images	N/A
	Digital Video	Create and edit streaming video	N/A
	Scanning	Scan texts and images	N/A

Table 3
Technology Knowledge and Skills Required by Program Participants

Software *Function*	Software *Applications*	Specific Knowledge and Skill Requirements for Participants
Web Access	Web Browser	View and navigate WWW, use search tools and bookmark, use plug-in to play multimedia files, and download programs from Internet
Document Creation	Word Processing	Create, format documents using table and border functions
Communication and Document Exchange	E-mail	Create, forward , and reply messages, and send attachment
		Sort incoming mail and create mailing list
	WebBoard	Post, delete, and attach files to a message and participate in chat rooms
	Various Software	Install, use, upgrade, troubleshoot software
	Database	Submit assignments and access instructor feedback and grades

An orientation training session for online instructors and teaching assistants was considered an essential element to the success of an online course. The following five essential components of an orientation training program were suggested by the instructors:

1. *General overview of the online program*. The first component of an online orientation training program should provide instructors with a general overview of the program, processes involved in using the online instructional system, and how they are supposed to work with instructional designers, web designers, database developers, and technical support. In short, there should be a clear orientation so the instructor understands the structure of the entire program and can better determine their roles and responsibilities. Another element considered important is the organization's vision of the online program as well as its importance to the organization.
2. *Description of the differences between online and face-to-face instruction*. Regarding the differences between these two types of delivery formats, instructors felt that those who have not experienced teaching online should be provided with an introduction to the differences between online and face-to-face instruction. Specifically, the level of detail needed for online delivery and the importance that details play in this type of instruction need to be emphasized. The instructors felt they should be trained on how to adapt face-to-face strategies to online environments. Also, because of the environment in which instruction is delivered, instructors felt they should be introduced to more innovative teaching strategies. In other words, the orientation-training program should provide them with a set of varied teaching options that can be effectively carried out in online environments.
3. *Differences between synchronous and asynchronous delivery*. Training should help instructors better prepare for synchronous and asynchronous delivery formats. For the synchronous sessions, they should be informed about strategies that promote individualized instruction and encourage active participation. For asynchronous sessions, instructors felt they should be prepared to manage time more effectively, learn how to be instructionally flexible, how to provide timely feedback without getting burnt out, and how to create and manage virtual teams.
4. *Communication skill training*. The online instructors felt that oral and written skills are probably much more important in online instruction than in face-to-face instruction. The lack of personal contact and the inability to see people's gestures puts a major burden on oral and written communication. The instructors felt that some information should be provided on how to effectively address online students and how to provide feedback and constructive criticism without being perceived in a negative way. They felt that good online communication skills are necessary because mistakes are more likely to be noticed by online students than face-to-face students. Finally, they suggested that this type of training should provide them with information on how to develop their skills to better interact with students, both formally and informally.
5. *Technology use training*. The instructors and teaching assistants stated that it is essential to know how to use the technology and be able to diagnose and solve common problems. They felt it was necessary to have technology training to get them to the level of feeling comfortable using the technology to interact with people. The instructors felt that they should be provided with many opportunities to gain "hands on" experience. They felt

that the best training is the one that most closely simulates the reality of online instruction. The instructors and teaching assistants recommended that they be provided the opportunity to practice in simulated environments until they attain the level of confidence necessary to perform naturally. One-on-one training was found to be effective in learning to master the new technologies.

Other topics that were mentioned as important for an instructor training program included copyright and fair use issues, institutional intellectual property rights policies, how to foster and assess deep learning, strategies for better preparation and time management, and how to facilitate collaborative learning online.

Technical Support Needed for Online Programs

Technical support is a critical aspect of any online program. Without a mechanism for supporting online instructors and students, frustration is sure to occur. The following listing of technical support for online programs was developed based on an analysis of the types of problems faced by instructors and students as they participated in an online program. This information is organized according to (a) the nature of the technology problems confronted and their resolution, and (b) the forms of technology support offered within the program—both initially and currently.

Nature of technology problems. An analysis of e-mail messages, technical support logs from a toll-free telephone support line, and archives from Instant Messenger communications provided a clear picture of the types of problems encountered by students and instructors, their frequency, and the reporting methods used. During the first online course, 90% (n = 34) of the requests for assistance occurred during the first half of the course. E-mail was the most common method used to report problems and request technical assistance (86% of all requests). Approximately 50% of the students used the technical support services, with an average of 3.5 support requests per student. Regarding the type of problems being reported, the most common problem was associated with an organizational firewall at a students' place of work that affected the delivery of audio and video files and prevented access to collaboration tools such as WebBoard and IRC chat. Other frequently reported problems were related to the lack of web browser skills, inaccurate use of e-mail functions such as attachments, and server problems due to external causes such as severe weather conditions in the form of storms and lighting. During the development of the first course, a total of 11 different types of problems were reported. These were problems related to email, browsers, WebBoard and its chat function, RealPlayer, server malfunctions, technical terminology, acknowledgment of messages and document submissions, and PowerPoint presentations.

An analysis of technical problems during the second online course revealed similar results. In this case, 92% of the support requests were for assistance during the first half of the course. The number of students requesting assistance increased slightly from the previous course, from 50% of the students in the first course to 61% in the second course. During the second course, access problems due to firewall constraints at a student's work location was a common problem, followed by problems with RealPlayer, and difficulties associated with uploading assignments to the course database. The uploading feature of the database was a new feature in the second course. During the development of the second course, there was a decrease in the types of problems reported. A total of 9 different types of problems were reported. These were problems related to the introduction of a new database for uploading documents to the instructor, server malfunctions, PowerPoint files, access to the we site, and access to the WebBoard and ChatBoard due to changes in IP numbers. Three other problems came from new students joining the cohort. These problems were related to the use of speakers, volume, and printers.

Forms of support offered. Given the types and frequency of technical problems from the first two online courses, as well as the prior expectations of potential obstacles, multiple support features were implemented in an effort to reduce the number of technical problems experienced by the online instructors and students. As a result, a comprehensive support system was created for the online program. Initially, only e-mail support and a toll free telephone line to provide access to online staff during normal business hours was provided. While these forms of support were adequate for most technical problems, there were instances where immediate assistance was required during non-business hours. To that end, additional support features were developed and implemented, including a set of Frequently Asked Questions (FAQ) that contain solutions to various problems, the availability of Instant Messenger for 1-to-1 and small group conferencing, and 24-hour chat-based support provided through a "Help Desk" manned by the university's Web Technology Group. With these five support options in place, virtually all of the technological support needs of the online students and faculty can be met satisfactorily.

Summary

This paper examined a variety of critical issues related to the successful development and implementation of online instructional programs. While many of these issues are taken for granted when planning traditional face-to-face instruction, they must be carefully considered when venturing into the realm of online programs. Programs delivered entirely online cannot simply be modifications of existing courses, rather, they must be viewed as completely new delivery systems that present different and unique problems. Online program developers need to carefully analyze the context and source of problems that arise and design appropriate interfaces, technology solutions, and support mechanisms to resolve the difficulties that will be faced by both the instructors and the students.

The History of Human Resource Development in Taiwan from 1949 to 1999

Christine M. Kuo
Gary N. McLean
University of Minnesota

This paper traces the history of HRD strategies and policies adopted in Taiwan since 1949. Contrary to the general belief of most Taiwanese scholars that HRD in Taiwan is a new field, this paper points out that the roots of HRD in Taiwan originated in the 1950s. This paper further posits three functions that the HRD system serves, seven patterns drawn from the evolution of HRD, and an HRD definition that is derived from the patterns and functions of HRD in Taiwan. Extent literature is relied on for the information presented.

Keyword: HRD in Taiwan (Republic of China), International HRD

Taiwan is one of the world's most densely populated countries. According to census figures (GIO, 1997), the population was over 21.4 million as of December 1996. Of these, about 9.3 million are classified as human resources; that is, they are over 15 years old and have the ability to work. Approximately 6.26 million are paid workers, as opposed to those who are self-employed or have some other working status. There are about 5.7 million males and 3.6 million females. In addition, 25-49 year olds are about 70% of the total labor force.

A low unemployment rate (2.81% in 1997) (CEPD, 1997) has been recognized worldwide as one of Taiwan's great achievements. In recent years, a shortage of labor has become a major concern. The number of skilled workers, though increasing dramatically, is unable to keep pace with demand (Hardee & Johns, 1988). The diverse needs and problems of such a large population and work force on this small island are the main challenges faced by Taiwan. Developing these human resources has been a main issue. Taiwan has built a solid foundation of labor-intensive industry by using its abundant and relatively less expensive labor force efficiently. Human resources have been critical in enabling Taiwan to succeed economically.

Problem Statement

The question to be answered within this paper is, "What is the history of HRD in Taiwan from 1949 to 1999?" The Nationalist government moved from China to Taiwan in 1949, and 1999 is the present. Within this question, there are four purposes: (1) to trace the history of HRD strategies and policies adopted in Taiwan since 1949; (2) to identify patterns from the evolution of HRD in Taiwan since 1949; (3) to posit the functions the HRD system serves in Taiwan; and (4) to posit an HRD definition that is derived from the patterns and functions of HRD in Taiwan.

Methodology

This paper is developed based on relevant publications (government and academic) and other secondary materials on human resource development (HRD) strategies in Taiwan and their role in Taiwan's economic development. The primary sources of data are various official publications of the Executive Yuan, the Ministry of Education, and the Council for Economic Planning and Development in Taiwan. Secondary sources are scholarly periodicals, internet protocols published either in Chinese or English, and pertinent books published either in Taiwan or the U.S. These materials were then patterned in a combination of chronological and topical order. Then the patterns were interpreted.

Theoretical Framework

In Taiwan's case, HRD is receiving much more attention recently and is now highly valued (Chen, 1997; Chen & Mink, 1995). It has aroused the attention of both scholars and the business/industry sector. Many Taiwanese HRD studies have been published in Taiwan and the U.S. during the 1990s. During the early 1990s, scholars in Taiwan

Copyright © 1999, Christine M. Kuo & Gary N. McLean

were interested in the effects of employer-sponsored training on labor productivity (Lyau, 1994). Lyau's study showed a positive, significant relationship between training and labor productivity at the firm level in Taiwan. In the middle of the 1990s, researchers turned to identifying the competencies HRD professionals should have and the roles HRD practitioners should play in Taiwan. For instance, Lee (1994) indicated that 34 HRD competencies and 12 roles of HRD professionals identified in Taiwan were similar to the competencies and roles in the U. S., as identified in a study conducted by ASTD (McLagan & Suhadolnik, 1989).

Cross-cultural HRD is also attracting attention. Chen and Mink (1995) examined the relationships between organizational climate and HRD practices between American and Chinese corporations in Taiwan. By using Lippitt's (1982) Human Resource Development Assessment Inventory, they found that the organizational climates and HRD practices in U. S. American firms and Chinese firms in Taiwan were different. Lin (1991) investigated the differences and similarities of management philosophy, organizational climate, and managers' learning among U. S. American subsidiaries, Japanese subsidiaries, and local Taiwanese firms in Taiwan. One of her major findings was that supervisors in Taiwanese firms participated most actively in company-sponsored learning programs, whereas supervisors in Japanese subsidiaries participated least actively.

In spite of this interest, however, no study, surprisingly, has indicated what HRD really is, that is, what the definition is of HRD in Taiwan. Two of the researchers mentioned earlier used the definitions of HRD originated in U.S. studies. Lee (1994) used McLagan and Suhadolnik's (1989) definition of HRD in his study. Also, Lee (1995) in his study took Walker's (1982) definition that HRD is the process of analyzing an organization's human resource needs under changing conditions and developing the activities necessary to satisfy these needs. Surprisingly, neither author explained why they picked these two definitions.

However, several studies that explored HRD activities in different countries all conclude that, although the majority of HRD principles applied internationally originated in the U.S., the nature and purposes of HRD activities differ in each country, as does its definition (Elliott, 1998; Harada, 1998; Hillion & McLean, 1997; Wee-Liang-Tan, 1998; Yan & McLean, 1997). The U. S. definition and functions do not completely apply to other countries.

Thus, without a review of HRD's history and its roots in Taiwan (or any other country), a comprehensive definition of HRD for that country cannot be established. Taiwanese scholars and researchers need to define what HRD is and to determine what functions the HRD system serves in Taiwan.

Research Findings

The review of literature revealed the following themes as critical in responding to the research question posed for this paper.

Recognizing the Importance of Developing Human Resources

The linkage between education and productivity has been the subject of numerous studies in the literature of both economics and of sociology (Lucas, 1981; Meyer, 1977; Ming, 1994). Taiwan's economic success supports the idea that developing human resources through education has an important bearing on economic growth.

In Taiwan, HRD has been a key strategy for economic growth since its beginning with a strong emphasis placed on education and vocational training by the Taiwan government. As early as 1911, when the Ching Dynasty was overthrown, Dr. Sun Yat-Sen, founder of the Republic of China, set a goal of basing the nation on the Three Principles of the People–Nationalism, Democracy, and the People's livelihood (MOE, 1996). It was essential to implement a new education system before the country attained this goal.

In 1929, before moving to Taiwan Island, the National government put forth the educational goal of fulfilling the ideal carried in the Three Principles of the People. Geography and history were to be taught to build a sense of Nationalism, lessons on social life and conduct were to be given to demonstrate the operation of Democracy, and vocational skills were to be taught to meet the Principle of Livelihood (MOE, 1996). Vocational education was emphasized by the founder of the country from its beginning.

Vocational Education

Taiwan has a skilled and productive work force to keep it competitive in the world market (Galenson, 1979; Kuo, 1983). As vocational education grew, so did Taiwan's industries. This did not happen by chance but was the result of a careful design. Many studies in the U.S. and Taiwan have established a positive relationship between economics and vocational education (Gustman & Steinmeier, 1982; Land, 1990; Lucas, 1981; Yuen, 1993).

Research has also indicated that vocational education has provided the skilled labor force that has contributed to economic development in Taiwan during the last several decades. Lucas (1981) also found that, without the efficient and highly skilled work force, Taiwan would not have held her economic advantage.

Origin of vocational education in Taiwan. In 1949, when the Taiwan Nationalist government was established on Taiwan Island, various forces and events were at play to shape the future of vocational education in Taiwan. The current vocational education system in Taiwan was imported in the 1950s from the U.S. (Chang, 1991; Chen & Shih, 1989; Land, 1976). In the 1950s, the U.S. government offered several projects to help Taiwan, among which was the Industrial Vocational Education Cooperative Project. A contract financed by the International Cooperation Agency was negotiated between Taiwan Normal University and Penn State University to establish a department of industrial education and a department of home economics. The two departments, established in the spring of 1953, marked a milestone in the history of Taiwan vocational education.

Proactive progress of vocational education. From the 1950s, Taiwan's policy on vocational education has been proactive, progressive, and constantly changing to meet manpower needs to attain its national objectives. Vocational education has been carefully planned and developed over the past forty years to meet this demand and challenge. To some extent, one of the major factors contributing to successful economic development in Taiwan is the quality and quantity of the well-educated and highly-skilled workforce provided by vocational education.

Because of the import-substitution policies initiated in the late 1950s and the export-promotion strategy in the 1960s, labor-intensive industries were chosen as the main thrust in Taiwan's economy (Hwang, 1991). The reform of vocational education policy was important in providing the human resources needed in the increasing labor-intensive industries at that time. The ministry increased the ratio of students in high school to those in vocational schools from 6:4 to 3:7 in 1981 to encourage the establishment of vocational schools. From the early 1970s to the early 1980s, the number of students admitted to senior high schools was gradually reduced, while the number of senior vocational school students increased. A parallel development was the increasing importance of high-quality facilities, curriculum, and faculty in vocational education. For instance, in 1972, a program was funded by a subsidiary loan from the United World Chinese Commercial Bank for equipment for senior industrial vocational schools. In 1973, the National Taiwan Institute of Technology was founded. In 1979, the first part (1979-1981) of a plan for improving senior industrial vocational education was implemented.

A diversity of vocational training sponsorship was attained by 1974 due to the establishment in 1972 of a National Vocational Training Fund, financed by a payroll tax of 1.5%. Two participating organizations that benefited from these programs were the Tung Yuan Electrical Works and the Yue Loong Motor Company. The Tung Yuan Electrical Works set up an apprenticeship training program in 1958 providing both theoretical and practical training, but it did not establish a formal training center until July, 1973. The Yue Loong Motor Company, the largest automobile producer in Taiwan, was the site of a vocational training center in the metal trades; it held six-month courses for about two hundred participants. It seems that, in view of the difficulties that most countries have had with public vocational education, the Taiwan sponsorship scheme has made for a more effective program.

Events of the past few years of the 1970s indicated that the industrial sector was gradually entering a new era of secondary import substitution (Ranis, 1979). To meet the challenge of the resulting relative increase in the labor shortage, the Taiwan government increased the budget for vocational education. For instance, in 1982, the government implemented the second stage of the advanced plan for industrial vocational education (1982-1985). That budget was more than NT$3,137 million, which was almost twice the amount spent on the first stage of the plan. In 1985, another NT$2,170 million was spent on the third stage. In 1992, the Ministry of Education implemented the "Prolonged National Education Based Upon Vocational Education" program. This program was developed to increase the work skills of youths who did not want to study in a general education curriculum.

Contributions of vocational education to a skilled work force. No research has shown what role vocational education and training have actually played in Taiwan's economic success. A few studies have shown that vocational students are less likely to be underemployed than general high school students (Wang & Hsieh, 1995). Wang and Hsieh (1995) found that male vocational business high school students were less likely to be underemployed than male general high school participants. To be underemployed meant that an individual is working less than he or she would like–and yet they are counted as employed in official statistics (Henderson & Poole, 1991).

The official opinion was that vocational education supplied the pervasive infrastructure undergirding the national economy (Harbinson & Myers, 1964). The effect of increased investment in vocational education on economic growth can be addressed by considering the impact of education investment on society's ability to produce (Hopkins, 1977). Another measure of the return of such investment in vocational education is the proportion of a nation's total production going to human capital (Hopkins, 1977). Thus, in Taiwan's case, the fact that there is a significant relationship between economic effect and vocational education (Gustman & Steinmeier, 1982; Land,

1990; Lucas, 1981; Yuen, 1993) is further evidence of investing in human capital. Some other studies indicated that the excellent work force results in Taiwan are from outstanding vocational education (Chen & Shih, 1989).

Integrating HRD with National Economic Strategies

Taiwan has been internationally recognized as having made great strides in its economic and technological developments in the past forty years (Galenson, 1979). There are many elements contributing to this success, but the most important one is the effective utilization of the abundant and high quality human resources (Lee, 1995). Since 1953, the Taiwan government has included "improving human resource quality" as a major component in the series of plans to develop systematically its economy. For instance, the major tasks outlined in the sixth four-year plan (1973-1975) were to speed up industrial modernization, expand infrastructural construction, improve manpower quality, and promote exports (CEPD, 1996). Further, in the seventh four-year plan (1973-1981), setting up manpower development was one of the major tasks in promoting energy efficiency, improving industrial structure, promoting balanced economic and social development, and completing the Ten Major Development Projects (CEPD, 1996).

In Taiwan, HRD exists in conjunction with other strategies to meet national economic objectives. A pluralistic approach to HRD has been adopted in Taiwan. The Ministry of Education (MOE) has major responsibility for vocational education, while the Council of Labor Affairs (CLA) is responsible for labor affairs, employment services, and vocational training. Other ministries involved with vocational training include Economic Affairs, Youth Council, and the Vocational Advisory Committee for Retired Servicemen. The coordination of human resource planning at all levels rests with the Council for Economic Planning and Development (CEPD) of the Executive Yuan, which undertakes macro-studies and formulates human resource policies.

Public in-service training programs are subsystems for providing HRD as adopted by the CLA. In a broad sense, public in-service training means training that is geared toward society at large; whereas, in a narrow sense, public in-service training is limited to the training implemented by vocational training institutions which are administered by the Employment and Vocation Training Administration (EVTA) under the CLA. Currently, there are 13 public Vocational Training Centers (VTCs) providing 8,425 training slots. Training programs cover 104 trade areas in metal processing, automotive maintenance and repairs, electrical engineering, electronics, computer information, construction, printing, and service industries. Any Taiwanese citizen who is over 15 years old or a junior high school graduate can enroll in pre-employment training for employable skill training. They also will be assisted to obtain employment by the government after completing the training.

Studies have shown a high degree of success in public in-service training. Land (1990) indicated that job placement records showed a high degree of success, and that many youngsters aspire to enter the training programs. Between 1984 and 1997, a total of 13 VTCs offered entry-level and advanced training to more than 292,530 trainees (EVTA, 1998a). Of this number, 112,266 trainees were enrolled in basic training programs and 180,264 trainees were enrolled in advanced training programs. Both total and advanced training program numbers have increased in the past 10 years. Trainees numbered 14,638 in 1985, 22,221 in 1990, and 28,253 in 1997. Trainees for advanced training programs numbered 7,069 in 1985, 15,175 in 1990, and 17,337 in 1997 (EVTA, 1998a).

Establishing Pluralistic Human Resource Development Delivery Channels

Since the 1980s, the Taiwan government has been very concerned about the development of and coordination among various government training centers and training plans. Having a strategic national economic plan in which HRD strategies are integrated is insufficient--what is required is an innovative and pluralistic approach to develop human resources and cooperation among government and local agencies. The pluralistic channels of Taiwan's local HRD systems include enterprise training provided by various institutions, including CLA's training service teams, the Small and Medium Enterprise Administration (SMEA), the Chinese Human Resource Management Association (CHRMA), and Human Resource Development Association (HRDA).

Training services provided by the Council of Labor Affairs (CLA) include enterprise training programs provided by public VTCs and cooperative or apprenticeship training (EVTA, 1998c). Enterprise training is also called employer-sponsored training. It has been defined by Vaughan and Berryman (1989) as "training available in or through the auspices of the firm" (p. 1). Lyau (1994) defined employer-sponsored training as "a systematic intentional process of altering an employee's permanent behaviors with an aim to contribute to the firm's effectiveness, and such process, which may occur outside of the firm, is through the auspices of the firm" (p. 23). This definition implies that training is provided by the employer only as it relates to organizational goals.

According to the Vocational Training Law legislated in 1981 and still in effect, firms are obligated to report their training to the Bureau of Employment and Training (BET) within two months after the end of the fiscal year. Since 1988, the BET has conducted an annual Vocational Training Survey (VTS) within both the public sector and private organizations (Taiwan's BET, 1992a) and the "Vocational Training Needs Survey" (VTNS) (Taiwan's BET, 1992b). Both surveys specified several occupations to be included in enterprise training.

What is the status of enterprise training in Taiwan? In the 1970s, local Taiwanese firms were unable to utilize their high-level human resources effectively and had difficulty in adapting to environmental changes (Negandhi, 1973). Negandhi found that training programs in Taiwanese firms were not well-developed for operatives. The large-scale VTS survey in 1985 indicated that "high labor mobility" was considered the most important reason for not conducting enterprise training (cited in San, 1988, p. 107). Not until the mid-1980s were enterprise training systems begun by some U. S. American companies in Taiwan (Chen, 1997).

One approach to overcoming the high cost in training and a high turnover rate is through enterprise training service teams monitored by CLA to provide small and medium-sized firms with technical services, subsidies, tax exemptions, and other incentives. Currently, there are six major approaches used in promoting enterprise training by the EVTA (EVTA, 1998c). Under this promotion policy, over 898 business enterprises in Taiwan have established training departments offering training to up to 590,000 employees annually (EVTA, 1998b). In 1996, the CLA assisted private enterprises in setting up 43 vocational training centers which have completed training for nearly 1,450 job hunters, as well as on-the-job training for more than 23,090 workers (GIO, 1997). In addition, a nation-wide network of 63 employee service centers offering career counseling and planning, labor education services, welfare, and other programs served 60,000 employees in 1994. A regional Labor Education Promotion Team in each city and county also offered a total of 13,172 training programs to over 477,336 laborers in 1995 (GIO, 1997).

Associations founded locally, such as the Chinese Human Resource Management Association (CHRMA) and the Human Resource Development Association (HRDA), are two major organizations comprised primarily of human resource professionals. They have positioned themselves to help local industry and government to create another economic miracle in the future. Despite its short formal history, the CHRMA, established in 1992, has positioned itself to enhance professional skills among members; to promote cooperation among industry, academia, and government; to improve HR management in small and medium enterprises; to provide the government with recommendations for policy-making and legislation; to establish direct communication channels with mainland counterparts that cultivate mutual exchanges of experience and the sharing of information; and to participate actively in international HR organizations and other professional activities in order to survey international trends for the local HR community (CHRMA, 1996). The major goals of the HRDA are to strengthen human resources within business organizations, enhance labor relations, strengthen productivity, and support the development of the economy in Taiwan (HRDA, 1993). Despite their short history, both organizations are dynamic, professional groups to which most human resource practitioners and business managers in Taiwan belong. They are deeply committed to elevating the nation's HRD and management, as well as its business and national competitiveness.

Discussion

After reviewing and investigating Taiwan's HRD strategies and policies adopted by the government since 1949, the authors summarized them into three parts: (1) patterns drawn from the evolution of HRD in Taiwan; (2) HRD functions in Taiwan; and (3) an HRD definition in Taiwan.

HRD Patterns

Seven patterns were drawn from the above review:

1. Because the organization responsible for the development of HRD policy is under the jurisdiction of the Council for Economic Planning and Development (CEPD) of the Executive Yuan, past and present HRD policy in Taiwan has shown great interest in promoting economic growth.
2. The pattern of in-service training provided by the Vocational Training Centers (VTCs) under the jurisdiction of the Employment and Vocational Training Administration (EVTA), a pragmatic mixture of government- and private-enterprise-sponsored institutes, seems to have worked well (Galenson, 1979).
3. Senior vocational schools and Vocational Training Centers (VTCs) often emphasize immediate placement of young job seekers with basic occupational skills instead of training them for long-term job security.

4. Autonomous HRD systems at provincial, municipal, and local levels have not been established to develop regional HRD programs.
5. Because of the high risks and costs involved in HRD programs, and high labor turnover rates, there is still a lack of participation of private firms in providing enterprise training to employees.
6. HRD and management associations founded locally but serving nation-wide are developing and growing rapidly and are attracting more and more attention from HR professionals and scholars, business and industry leaders, and local communities.
7. The government's commitment to develop human resources through formal vocational education and informal vocational training is a long-term goal.

HRD Functions

The HRD strategies and policies adopted by the Taiwan government since 1949 and the patterns above led to the following three functions of Taiwan's HRD system:

1. From a macro-economic point of view, HRD helps make laborers more employable, decreases unemployment, and enhances economic growth. For instance, youth develop work-related capabilities through senior vocational schools and in-service training programs offered in Vocational Training Centers (VTCs).
2. From a social point of view, HRD helps disadvantaged people develop needed skills for jobs. The VTCs provide vocational training for the handicapped and the "Skill Testing and Certificate" regulations encourage those who do not want to pursue a further academic degree to be certified for further employability.
3. From a scientific and technological point of view, HRD improves labor's skill levels, upgrades technological levels, increases mobility, and reduces structural unemployment. Workers can pursue higher grades of skill certificates and upgrade their skill levels in the VTCs. The training programs and research and development activities sponsored by the Council of Labor Affairs and the Small and Medium Enterprise Administrations allow workers to update their technical and professional skills. Finally, the services of career counseling and planning provided by the Information and Service Centers of the CLA help laborers with career development.

HRD Definition

So, what is the definition of HRD in Taiwan? Ideally, there should be one definition of HRD developed for Taiwan that makes the concept of HRD clear and distinct. It should describe its nature and basic qualities in explicit terms–what it does, for whom, and why. Scholars in Western countries have indicated that "HRD has yet to agree on one definition and some assert that it will not likely do so" (Ruona & Swanson, 1992, p. 1). The authors agree. Any definition of HRD will change from time to time as its concept, scope, and delivery methods are expanding and changing to meet the needs in internal and external environments.

From this review, the definition of HRD that emerges is: *A systematic, intentional, innovative, and long-term committed process of developing an individual's work-related learning capability through education and training with an aim to contribute to individual, organizational, and national growth.*

The purpose of education and training is emphasized through development and growth. To achieve HRD's intended goal, participants need to be developed for the long-term. Education and training focus on the individual. Individuals are the mediating forces through which development occurs and the impact of HRD is experienced. Finally, HRD is work-related. The organization and the whole nation grow through the work of each individual.

Conclusion

This brief review of the evolution of HRD policies and strategies adopted by the Taiwan government since 1949 provides an interesting and unique case study of HRD as a national strategy that might be useful for other countries. The Taiwanese government recognized early the importance of investing in human capital and of committing to develop human resources to promote national economic growth. Since the 1950s, the government has integrated macro-economic HRD strategies with other national economic objectives. Further, through a pluralistic approach which has been planned, implemented, and evaluated by multiple governmental departments, people in Taiwan have different channels for pre-employment training, advanced training, job transfer training, second expertise training, and vocational training for the handicapped. Finally, people in Taiwan have easy access to employee services, such as career counseling, career planning, and labor education nation-wide.

Finally and most importantly, this paper posits three HRD functions and an HRD definition based on the patterns drawn from the evolution of HRD strategies and policies adopted in Taiwan since 1949. It is the belief of the authors that knowing the origin of HRD practices, the evolution of HRD policies and strategies, and the functions of HRD systems is essential for a better understanding of the current HRD status and implications. The authors also hope that there is something to be learned from history.

Expatriate Development for the Asia-Pacific Region: A Comparative Analysis of Expatriates from Five Countries Across Three Continents

AAhad M. Osman-Gani

Nanyang Technological University, Singapore

With increasing interests for business expansion in the Asia-Pacific region, expatriate development has become a critical international HRD issue for MNEs, who are taking active interests in expansion of their business operations in the potential region of Asia, despite the current financial crisis. There has been substantial empirical research on expatriate management in the west, but very little was found on Asia, and comparative studies are lacking. This paper presents the findings of a descriptive study conducted on key international HRD issues, specifically relating to training and development of expatriates from five countries representing the three major continents of the world (Singapore, Japan, Korea, Germany and USA) . The results provide significant information about the types of expatriate training programs, training contents, duration, delivery modes, and providers of effective training programs that would lead to productive expatriate performance in the Asia Pacific region.

Key Words: International HRD, Expatriate Training, Asia Pacific

Owing to rapid globalization of business activity, international human resource development (HRD) has become increasingly important in recent years. This is especially true when domestic human resource development takes on international dimensions as it deals more with multicultural workforce. International HRD, much of it embodied in cross-cultural training, has been proposed by many scholars as a means of facilitating more effective interaction among managers, employees and customers from different national-cultural backgrounds. Various reasons have been cited for this, the most prevalent being that such training is not thought to be necessary and thus top management sees no need for it. However, the fundamental reason behind the lack of training seems to lie in wrong assumption that good management is good world-wide (Black & Mendenhall, 1989; 1985; Black, 1988; Schwind, 1985; Runzheimer, 1984; Tung, 1981; 1984; Graham, 1985; Landis & Brislin, 1983; Brislin, 1981; Bouchner, 1982; Harris & Moran, 1979; Zeira, 1976).

Global and cross-cultural training and career development planning becomes necessary for managers in today's organizations, regardless of their domestic or international assignments (Osman-Gani, 1997, 1996; Marquardt & Engel, 1993; Odenwald, 1993; Reynolds & Nadler, 1993; Johnston, 1991; Rhinesmith, 1991). While much has been written on expatriate training and development in general, very little was documented on comparative analysis among expatriates from different national and cultural backgrounds, specially who are working in Asia. With Asian economies ready to take centre stage in the twenty-first century, despite the recent financial crisis, it is only logical that we should have a better understanding of the comparative expatriate management issues spanning the three continents. This study attempts to fill the research gap in this area of international management and international HRD literature, which by far focused mainly on the Western economies.

Until the recent regional financial crisis (since the last quarter of 1997), East Asia was one of the fastest growing regions in the world. According to the UN World Economic Survey, East Asia grew by an annual average rate of 4.5% during the last decade, while ASEAN's (Association of South East Asian Nations) average was at 6.8%. The comparable rate for the US was 1.4% and 1.7% for Europe. ASEAN member countries were ranked among the world's largest hosts of foreign direct investment inflows. At the same time they are becoming significant foreign investors themselves, mostly in other less-developed Asian countries. The OECD has projected the Asia-Pacific to grow by 5-6% to the year 2010. On the other end, the comparable rates for North America and Europe were set at 2-5% and 3-4% respectively.

USA, Germany, Japan, and South Korea are found to have extensive overseas business operations in the region, especially in the form of foreign direct investments (FDI). Among the Asian economies, Japan is the most export-oriented country, which is followed by South Korea and Taiwan. Singapore is a relatively new player in this game, but it has shown substantial growth in its overseas business performance during the last few years after the government's aggressive policy of Regionalization. However, the predominance of the literature in English has been on the American MNEs, followed by some Europeans with very little information on the training of expatriates

Copyright © 1999 AAhad M. Osman-Gani

for the Asia-Pacific region.

This paper reports the findings of a study conducted on the expatriates from these five countries working in the Asia Pacific region, with the view to obtaining descriptive accounts on the types of training programs considered important for preparing expatriates, the areas of emphasis in the training programs, the duration of such programs, the training delivery methods, and the agency that should deliver training so as to ensure greater effectiveness. In addition to the descriptive findings, the author also explored the differences in what the expatriates from these economies perceive on these aspects of training. The author chose to use expatriates as the source of data as they provide a relatively unbiased information being individuals who have been deployed on overseas assignments and who being "in the field," so to speak, could provide insights into the training needs of expatriates. Differences are expected in the training and development strategies in the light of differences in the domestic environments of the sending organizations. These differences may be due to socio-cultural, legal, political and economic environments of the countries, which are at different levels of economic development.

In order to address the issues on comparative expatriate development, the following research questions are formulated for this study:

1) Are there differences in the types of training programs that are considered to be important for preparing American, German, Japanese, Korean and Singaporean expatriates to take up overseas assignments in Asia?
2) What is the nature of difference among expatriates' views on several training content areas to be incorporated in an expatriate training program for Asia?
3) Are there differences in the views of appropriate duration for a pre-departure training program provided to the expatriates from the five countries?
4) What is the nature of difference in expatriates' views on appropriate training delivery methods to ensure effective expatriate performance in the Asia-pacific?
5) Are there differences among expatriates' views on who should deliver the training programs to ensure greater effectiveness of their performance?

Methodology

The research methodology for the study consisted of sample interviews, and a survey of American German, Japanese, and Korean expatriate professionals working in Singapore. The survey also included a sample of Singaporean managers who were working overseas, and could be available in Singapore after completing or in the process of completing the assignment. A questionnaire was developed to collect data on several issues relating to training and development and other areas of expatriate management. In designing the questionnaire, some items were selected from previous surveys used in similar studies conducted in other countries, which were integrated with additional items developed from the findings of the interviews and the literature review.

A panel of experts comprising of university business faculty, and senior business executives, was consulted to verify the content, sequence, structuring and relevance of the questionnaire items. In addition, it was administered to a sample of forty expatriates each from America, Germany, Japan, Korea, and Singapore, in a pilot test. In the process, views and suggestions were gathered on further improvement to the questionnaire so that it is comprehensive enough to cover the relevant issues and is easy enough to complete by the expatriates. The questionnaire was administered personally to achieve a good response rate.

For the purposes of the study, the authors obtained stratified random samples of American (180), German (180), Japanese (180), Korean (170), and Singaporean (180) expatriates. The expatriates represented various multinational enterprises (MNEs) operating in three major business sectors in Singapore. Stratified random sampling method was used to draw the samples from the sampling frames of the five groups. The sampling frames were identified from the membership listings of the American, Japanese, Korean and German Chambers of Commerce and Industries in Singapore, and by consulting the "Singapore 1000" directory listing. The study focused on the companies from the three major business sectors representing the three classification strata of the study. Each stratum comprised ten companies from each of the three major business sectors: Manufacturing, Transportation/Logistics, and Financial Services. These three sectors were found to cover most of the MNEs based in Singapore. The classifications of the three major industrial sectors were taken from the Singapore Standard Industrial Classification.

A total of 501 completed questionnaires were obtained. Of these, 150 were from the Japanese sample (response rate of 83.33%); 103 questionnaires were obtained from the Korean sample (response rate of 60.59%); 72 questionnaires were from the American sample (response rate of 40.0%); 80 questionnaires were received from the

German sample (response rate of 44.44%); and 96 completed questionnaires were received from the Singaporean sample (response rate of 53.33%).

Results

Respondents' Profiles

The representation of the expatriates from the three major business sectors is shown in Table 1 below:

Table 1
Distribution of Respondents by Industry and Economy

Economy Industry	Manufacturing (%)	Transportation/ Logistics (%)	Financial Services (%)
America	47.2	19.4	33.3
German	47.5	17.5	35.0
Korea	41.7	25.2	33.0
Japan	33.3	33.3	33.3
Singapore	57.3	19.8	19.8
Total	43.9	24.6	30.9

It can be observed from the above table that majority of the respondents were from the manufacturing sector (43.9%) for all countries except Japan, whose expatriates were found to be evenly distributed among the three sectors of this study. Respondents in the financial services sector were almost equitably distributed among the five countries with the exception of Singapore, where financial services and transportation sectors were relatively less represented. Transportation and logistics sector drew the least number of responding expatriates in this study.

From a demographic analysis of the responding expatriates, it was found that most of the respondents were of ages between 30 to 44 years old (68.4%), while there were no respondents under the age of 24 for Germany, Japan and Korea. Male respondents formed an overwhelming majority (89%) in all the groups of respondents. The Singaporean respondents manifest the similar imbalance although there is a relatively higher representation of female expatriates compared with the other countries. This gender imbalance is consistent with world wide trend of overseas assignees, and is not peculiar to the respondents of this study. Of the five groups of respondents, it appears that Korean, Japanese, and American MNEs prefer to send married expatriates whereas Singaporean companies were found to be open to both gender types.

In terms of the primary functional areas represented by the respondents, it was found that, overall most of the respondent (59.9%) were involved in general management and marketing functional areas. This may be due to the emphasis placed on the importance on these areas at the early stage of FDI in the Asia-Pacific region. Among them, German and Singaporean expatriates seemed to be more involved in General management areas, whereas Japanese Americans were performing marketing and sales functions, while Korean expatriates and were distributed among general management, finance, and marketing jobs.

Issues of Expatriate Training & Development

Training and development of expatriates should begin where the selection process ends. The basic aspects of expatriate development are, the development of expatriates before, during, and after overseas assignment; the orientation and training of expatriate families before, during, and after foreign assignments; and the development of the headquarters staff responsible for the planning, organization, and control of overseas operations.

Research has shown that expatriate training is often neglected or handled poorly in many international organisations. Baliga and Baker (1985) found that only 25% of the largest U.S. MNCs provide extensive pre-departure orientation programs. Tung (1981) also observed that only 32% of the U.S. companies surveyed provided some international training. Expatriate training seemed to be more prevalent amongst the European and Japanese MNEs, with 69% of the European and 57% of the Japanese multinationals rendered some form of training to their expatriates. Studies have also found that between 16% and 40% of American managers sent on overseas assignments return prematurely because of poor performance or because of the inability to adjust to the foreign environment. The costs for expatriate failure also include unquantified losses like damaged corporate reputation and

lost business opportunities. Clearly, some form of training is necessary to minimise expatriate failure (Baker & Ivanceich, 1971; Tung, 1981; Black, 1988; Harvey, 1989).

International training and development programs need to recognise the importance of bringing about attitudinal and behavioural changes in the expatriates and their families. Rahim (1983) proposed a model to guide the development of expatriates. The major developmental issues that need to be considered are summarised in this model, which emphasised the need for constant feedback to allow for evaluation of the expatriate's performance. It is also through these feed backs that corrective actions can be taken to resolve any difficulties the expatriate may be facing, thereby helping to improve the expatriate's job performance in the host environment. Mendenhall and Oddou (1986) proposed three critical areas in which the organizations should prepare their expatriates. These are: cultural training, language instruction training and orientation training on familiarity with everyday matters. Similarly, Rahim's model also emphasised these areas. Preparation can take place before departure, post-arrival or during re-entry. The aim of the preparation is to ensure the expatriate is familiar with the host-country conditions, culture and his family's needs in a new environment. Relative preference for the three types training were sought from the five groups of expatriates, and Table 2 presents the findings below.

Table 2

Importance of Pre-departure, Post-arrival and Repatriation Training

Expatriate Training	USA		Germany		Japan		South Korea		Singapore			
	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	F-value	P-value

*(1= Least Important, ... 5 = Most Important) * = significant at 0.05 level ** = significant at 0.01 level

It can be seen that expatriates find the importance of pre-departure training at the home country and post-arrival training at the host country compared to the repatriation training. Japanese and German expatriates do not see the importance of repatriation training, while post-arrival training were identified as more important by all the groups. This signifies the importance placed on the learning need for relevant expertise required to conduct business at the host country by considering the socio-cultural and other environmental factors.

Types of Training

Tung (1982) identified six major types of cross-cultural training used by American, European and Japanese companies. They are: (1) environmental briefings used to provide information about such things as geography, climate, housing and schools; (2) cultural orientation designed to familiarise the individual with cultural institutions and value systems of the host country; (3) cultural assimilators using programmed learning approaches designed to expose members of one culture to some basic concepts, attitudes, role perceptions and customs of another culture; (4) language training; (5) sensitivity training designed to develop attitudinal flexibility; and (6) field experience, which sends the participant to the country of assignment to undergo some of the emotional stress of living and working with people from a different culture. Tung also observed that both American and West-European companies recognized the need for more rigorous training for the CEOs and functional heads than for trouble-shooters and operatives. In contrast, the Japanese films appeared to provide slightly more rigorous training for the operatives. Brewster (1988) observed that the emphasis placed by European and Scandinavian MNEs on pre-departure training, particularly language training, continues to be stronger than that of American multinationals. Feldman (1989) surveyed American firms regarding relocation programs regarding relocation programs and found that only 13% of the respondents indicated that they would offer expatriates an orientation program. McEnery and DeHarnais (1990) estimated through a review of American practices that between 50 and 60 per cent of American companies operating abroad do not provide any preparatory training for expatriates. Those that do provide such training, focus only on brief environmental summaries and some cultural and language preparation, and only half of

these programs would last longer than a week. Again, Barham and Devine (1990) found that European, Scandinavian, and Australian firms place less priority on providing pre-departure training for the spouse and family.

Derr and Oddou (1993) advocated cross-cultural seminars as a training method for internationalisation of managers. Baliga and Baker (1985) suggested that the expatriate receive cross-cultural training focused in the assigned region's culture, history, politics, economy, religion, social and business practices. They advocated a training program concentrated on a particular location as opposed to one in which expatriates are taught the broad differences in cultures and encouraged to be receptive to them. However, cultural training is not provided by many organisations. Dunbar and Katcher (1990) observed that only 30% to 45% of the MNEs offer relevant cross-cultural orientation to their expatriates. As Earley (1987) mentioned, a major objective of inter-cultural training is to help people cope with unexpected events in a new culture. Cultural training enables individuals to adjust more rapidly to the new culture and be more effective in their new roles. This cultural preparation is necessary for overseas assignment because financial ability alone does not determine success (Dowling, Schuler & Welch, 1994; McEnery & DesHarnais, 1990).

Language training is needed for successful and productive expatriate performance abroad and should form the part of any long-term management development program for aspiring global executives. Mendenhall and Oddou (1986) stressed that willingness to communicate does not refer to the level of fluency in a foreign language but rather the expatriate's confidence and willingness to use the host-country's language. Proficiency in a foreign language can improve the expatriate's effectiveness and negotiability strength, and can improve the expatriate's access to important information regarding the host-country's economy, government and market.

Practical assistance training makes an important contribution toward the adaptation of the expatriate and the family to their new environment. Some MNEs like Colgate-Palmolive (Lublin, 1992) believe that there is no substitute for on-the-job training in this regard. Ronen (1989) proposed a set of methods and techniques for intercultural training and identified the purposes for each of those methods. There is no unanimity among scholars in recommending a set of training methods and techniques or types of training that would be effective in all nations and cultures. This study aimed at identifying the effective types of training programs for the expatriates working in the Asia-Pacific region.

Research Question 1 : Are there differences in the views of expatriates from the five countries on the different types of training programs for preparing managers to take up overseas assignments in Asia?

In this study, the five groups of expatriates were asked to rate the relative importance of various types of training programmes that should be provided before going on overseas assignments. Six different training programmes were suggested in the questionnaire, and the respondents rated the following types of training in terms of their importance. Table 3 presents the findings with mean scores of the respondents' views.

Table 3

*(1= Least Important, ... 5 = Most Important) ** = significant at 0.01 level

Host language training was rated as very important for pre-departure training by all expatriates, except the Americans. However, the American, German, and Singaporean expatriates placed greater importance on cross-cultural training. Prima facie, this finding appears contrary to prior studies on expatriate training indicating the importance of language training but can be explained by the fact that English is the main language of business in Singapore and many countries of the region. The American expatriates do not need training in English for deployment in Singapore and the German expatriates may have English language capability as English is a second language in German school curriculum. It is also interesting to note that overseas acquaintance trips were not considered as important by most of the expatriates whereas the American expatriates rated this as the second most important type of training (mean of 3.35). For the Korean, Japanese and Singaporean expatriates, overseas acquaintance trip is not important probably because they are familiar with the region. In the case of the German expatriates, this finding is interesting as America is further away in distance from Singapore when compared to Germany. Hence, it would not be possible to assert that the trips are not required as they are usually costly and time-consuming, and the marginal benefit derived from these trips over the other training programs does not justify the additional time and resource commitments. This difference could be explained by the fact that German companies have a longer history of overseas operation in Asia compared to the American companies. This situation may be compounded by the fact that it is traditional for managers to be rotated within the domestic confines of the United States with overseas appointments being the exception rather than the rule.

The ANOVA results show that there are significant differences in the views of expatriates, which can be seen from their mean response scores of importance. The author also conducted post-hoc analyses of the means that were found to be significantly different. The results are shown in Table 3a below.

Table 3a

Types of Training	Mean Difference

* = significant at 0.05 level ** = significant at 0.01 level

The post-hoc analysis bears out the earlier observations on the importance placed by Korea, Japan and Singapore on host country language training; American and German expatriates do not rate it as highly important as them and there is no significant difference in the importance attached to it by the Americans and Germans. Similarly, the earlier observations on overseas acquaintance trips is borne out by the post hoc analysis. Table 5a shows that Korean and Singaporean expatriates place greater importance on area studies than the Americans, Germans and Japanese. This difference may be explained by the availability of information within these MNCs, who are more experienced in international business and their philosophy behind the pre-departure training. An observation is necessary on family adjustment orientation training. It is the type of training with no significant difference was found across countries, with the exception of Japanese, who rated this significantly different from the Americans and the Singaporeans. It is ranked as the third or fourth most important training in each group by their mean scores.

Training Contents

In designing training and development programs for expatriates, companies need to recognise the importance of multiple home-country and host-country role relationships. Rahim's (1983) model for developing key expatriate executives showed major relations between the expatriate manager and other parties interested in international business. The content, mode of delivery and training rigor are important factors in determining the success of training and development programs for overseas assignments. It is very important to identify the relevant areas of training content before designing an expatriate training program so that the required knowledge and skills are provided for effective expatriate performance. Osman-Gani and Toh (1995) conducted a study on more than 200 senior managers of Singapore-based companies involved in international business. The study covered several issues of training and developing managers for success in overseas assignments in the Asia-Pacific region. They identified several areas of training needs with specific content requirements. Seven broad areas were identified, knowledge in which were found to be critical for successful performance in overseas assignments. This study sought expatriates' views on these different training content areas for the Asia-Pacific region.

Research Question 2 : What is the nature of difference among expatriates' views on several training content areas to be incorporated in an expatriate training program for Asia?

In order to respond to the above research question, expatriates were asked to rate the relative importance of various training content areas which should be included in an international training program designed for expatriate managers and professionals. The respondents rated the relative importance of the seven areas. The mean scores together with the ANOVA results are presented in Table 4. Post-hoc analyses of the responses were also conducted on training contents for which significant differences were found in the means at different levels of significance.

Table 4

*(1= Least Important, ... 5 = Most Important) * = significant at 0.05 level ** = significant at 0.01 level

General management training area was rated highly by all the five groups of expatriates. Ranked by the means scores, general management is ranked the most important by the Germans and Japanese, second by the Koreans and third by the Americans. It can be observed that there is a similarity in rating top three training content areas deemed important by the American and German expatriates: human resources and labour factors, socio-cultural, and general management. In contrast, the Korean expatriates consider issues concerning accounting, financial and taxation policies of the host country to be more important, followed by general management issues and marketing issues. It is interesting to note that the Korean expatriates did not consider the socio-cultural factors and production/technology factors as important training content areas relevant to their performance. The Japanese and Singaporean expatriates placed substantial importance legal and environmental factors. The post-hoc analysis reveals that the Koreans' mean score differ significantly from all other expatriates, whose means are not significantly different among themselves, in the areas of human resource and socio-cultural factors. This may be

owing to the Koreans' familiarity with the socio-cultural environment of the region, and with the specific job related factors that they would be dealing with. This can be contrasted with Osman-Gani & Toh 's (1995) findings where the top three preferred areas of training were general management, human resource & labour, and legal & environmental issues. Accounting, financial and taxation factors is the most important area for the Koreans. The background of the respondents may provide some explanation in this regard. However, Table 3 showed that there is no preponderance in finance and accounting as a primary functional area, although 20.6% of the Korean respondents have finance/accounting as their primary functions. The emphasis on accounting, financial and taxation factors may be a reflection of the Korean MNEs focus on financial controls as a means of strategic control.

Training Duration

Determining the right amount of pre-departure training for expatriates is not an easy task. If too little time is spent on pre-departure training, the expatriates may not be well prepared, which could lead to poor job performance and even premature termination of the expatriate assignment. On the other hand, if too much time has been spent for pre-departure training, the trainees may suffer from information overload and boredom, and the company may be spending too much resources. Among the various types of training programs for international managers, some last only few hours, others last for months. Some are fairly superficial, others are extensive in coverage.(Mendenhall & Oddou, 1988; Hodgetts & Luthans, 1994). The preferred duration of training for overseas assignment in the Asia-Pacific would vary widely with mean hours of 17 to 51 hours for a program depending on the type and contents of the program. The majority of the companies (54.35%) had pre-departure expatriate training programs of an average duration of one to four weeks per program in a year (Osman-Gani & Toh, 1995). This study aimed at identifying appropriate duration of pre-departure training program for expatriates working in Asia.

Research Question 3 : Are there differences in expatriates' views on the appropriate duration of a pre-departure training program for managers' overseas assignment in Asia?

To answer this question, the expatriates were asked to identify the appropriate duration for an expatriate training program to be conducted before taking an overseas assignment. Table 5 presents the findings of the expatriates' views in order of their importance along with the ANOVA results.

Table 5
Appropriate Duration for Pre-departure Programmes

Training Duration	**USA**		**Germany**		**Japan**		**South Korea**		**Singapore**		**F**	**P**
	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	-value	-value
1 day (8 hours)	2.25	1.18	1.45	0.75	1.56	0.88	2.01	0.94	1.66	0.94	10.346**	0.000
3 days (24 hours)	3.07	1.20	2.08	1.01	2.10	0.98	2.55	0.79	2.48	1.17	13.024**	0.000
1 week (40 hours)	2.79	1.29	3.01	1.25	3.03	1.10	3.01	0.92	3.19	1.09	1.329	0.258

More than 2 weeks	1.75	1.34	2.36	1.21	2.99	1.46	3.84	1.20	2.42	1.28	30.888**	0.000

*(1 = Least Appropriate, ... 5 = Most Appropriate) ** = significant at 0.01 level

Table 5 shows that there are distinct preferences on training duration for expatriates from each economy. There is no commonly preferred specific duration for training indicated by the expatriates. What can be discerned from the mean scores for each group of expatriates is a distinct preference on the part of all expatriates (except Americans) for training to be of a longer duration. Only Korean expatriates' top preference for training was found to be more than two weeks in duration whilst others showed the preference for the duration of one to two weeks. In contrast, American expatriates preferred training to be of a shorter duration instead. Whilst the American preferences are not exactly in perfect descending order, they prefer training of three days, one week and one day as the top three preferences according to the mean scores. When the mean scores for each group of expatriates is

analysed using ANOVA, no significant difference was found in the scores for the duration of "one week," signifying the unanimity of preference in this respect.

Post-hoc analysis results reflect the significance of differences in the preferred duration of training among the groups. It may be observed that least significant differences were found among the Koreans and Singaporeans, as well as among Germans and Japanese. They only differed in "more than 2 weeks" category. Whereas Americans differed significantly with all the groups for almost all training duration categories.

Training Delivery

Selection of appropriate training delivery methods depends on many factors, the most significant one being the training rigor, which is again dependent on job and culture novelty issues. Research shows that training rigor is critical to the success of cross-cultural/expatriate training programs. The ability of a firm to determine the appropriate degree of training rigor needed for its global managers is the secret to cross-cultural training design. Black and Mendenhall (1989) presented a model showing the relationship of high and low rigor training with methods of delivery and time spent on training. According to them, low rigor training includes approaches such as lectures, films, area briefings, and books. Whereas high rigor training approaches are interactive language training, assessment centers, and sophisticated cross-cultural simulations. The duration of low rigor training was four to twenty hours, and for high training rigor, it is between 60 to 180 hours (Black, Gregersen & Mendenhall, 1992; Black, Mendenhall & Oddou, 1991; Black & Mendenhall, 1989; 1990). This study attempted to identify the suitability of various types of training delivery methods for effective expatriate performance in their overseas assignments in Asia.

Research Question 4 : What is the nature of difference in expatriates' views on appropriate training delivery methods to ensure effective expatriate performance in the Asia-Pacific?

Six most common training delivery methods used for expatriate training were identified through literature search, and the respondents were asked to rate the relative appropriateness of the methods to ensure effective overseas performance. The descriptive findings and the ANOVA results are presented in Table 6.

Table 6
Appropriate Training Delivery Methods for Effective Expatriate Performance

Training Delivery Methods	USA		Germany		Japan		South Korea		Singapore		F	P
	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	-value	-value
Lecture / classroom training	2.71	1.07	2.55	0.84	3.11	0.84	3.01	0.75	2.87	0.87	6.583**	0.000
Workshop / seminar	3.33	1.16	3.29	0.91	2.93	0.81	2.86	0.65	3.07	0.88	5.231**	0.000
Case-study / video system	3.11	0.99	3.28	1.01	3.21	0.94	3.12	0.85	3.23	0.89	0.493	0.741
Role play / Interaction	2.60	1.24	3.46	1.09	3.02	0.87	2.82	0.85	2.84	1.04	7.981**	0.000
Self-instructional training modules	2.53	0.96	2.42	1.08	2.97	0.92	3.10	0.75	2.49	1.10	10.153**	0.000
On-site (on-the-job training)	3.78	1.12	4.05	0.87	3.93	1.09	4.11	0.87	3.88	0.92	1.538	1.900

*(1 = Least Appropriate, ... 5 = Most Appropriate) ** = significant at 0.01 level

On-site or on-the-job training has been ranked as the most appropriate and effective training delivery method by all groups of expatriates. The ANOVA results show that there are no significant differences in the means for this delivery method among the groups. This could be because such form of training is by far the most direct (with one to one personal contact) form of instructional method. It provides trainees with an opportunity to learn through hands-on experiences under real-life business settings, and opportunities to clarify issues on the spot. The ANOVA results also show that there are no significant differences among the groups for the case-study/video system based training programs, which are very popular among the expatriate managers.

When the delivery methods preferred by each group are ranked by their means, one can observe similarity in the preferences between the Americans and the Germans. After on-site training which is common to all the groups, these two groups prefer workshops (American – 2nd; German –3rd), case study (American – 3rd; German – 4th), and lectures (American – 4th; German – 5th) in the descending order of preference (based on the ranking of the means). The only exception is role play, which is ranked 2nd most important by the German expatriates. The post-hoc analysis revealed that there is no significant difference between American and German expatriates in the mean scores for lecture/classroom teaching, workshop/seminar, and self-instructional training modules; the first two findings confirming the observation on the similarity in American and German preferences.

Asian (Korean, Japanese and Singaporean) expatriates appear to prefer delivery methods that are in one direction with less interaction where there is possibility of "loss of face" or public embarrassment. They appear to opt for situations of one to one or one to small group learning (e.g. on-site). Their aversion to interactive learning (workshop, lectures and case analysis) is seen in the preference for self-directed learning. The above findings are also consistent to a great extent with previous studies on international training and development.

Research Question 5 : Are there differences in the views of expatriates on who should deliver the training programs to ensure effective learning and performance in the Asia-Pacific?

In order to identify the effective providers of expatriate training programs, the respondents of this study were asked to rate the relative effectiveness of the various training providers. Table 7 presents the findings as follows.

Table 7
Effective Providers of Expatriate Training Programmes

Training Providers	USA		Germany		Japan		South Korea		Singapore		F	P
	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	Mean*	S.D.	-value	-value
In-house / company personnel headquarter	3.08	0.93	3.18	1.08	3.47	1.05	3.31	0.85	3.28	0.85	2.333	0.055
Host country subsidiary / partner personnel	3.69	0.93	3.63	0.86	3.53	0.90	3.68	0.86	3.60	0.93	0.617	0.651
Outside professional consultants	3.07	1.05	2.99	1.01	3.03	0.89	3.00	0.70	2.82	0.91	1.050	0.381
University / academic professionals	1.88	0.82	2.35	1.06	2.29	1.07	2.53	0.81	2.53	0.81	5.245**	0.000

*(1 = Least Effective, ... 5 = Most Effective) ** = significant at 0.01 level

Host country subsidiary/partner personnel has been regarded by all the expatriates as being the most effective and qualified to provide the necessary training for effective expatriate performance. This could very well be due to their familiarity with the conditions and environment of the host-country, and hence are in the best position to impart the necessary knowledge and skills of host-country management to the expatriates. In-house/company personnel/headquarter is the second most important in all the groups. The ANOVA results show that there is no significant difference in the means, except in the category of academic professionals. It may be interesting to note that the expatriates for all the five countries viewed the university/academic professionals as being the least effective among the four groups of expatriate training providers.

Conclusions

In the past, studies on expatriation often focused on regions outside Asia, especially on Europe and America. However, as the Asian economies have gradually become important and interesting to foreign investors/MNEs, the relevance of those studies in the context of current business trends needs to be re-assessed. One can not deny the existence of the fundamental differences in historical, socio-cultural and political backgrounds between the East and the West. Research findings in the past pertaining to expatriates working in the west mostly from countries such as the United States and other European countries may not necessarily apply to the rapidly growing number of expatriates working in Asian countries. Further, the recent involvement of MNEs from developed countries in Asia provides an excellent opportunity to re-evaluate the training of expatriates in this region. This study, through focusing on the five groups of expatriates from three continents, may uncover new perspectives and directions in

international human resource development, particularly relating to the critical HRD decisions of design, development and delivery of effective training programs for effective performance in the expatriate assignments in Asia. Empirical findings from this study showed significant differences among the expatriates from different countries on various issues of training and development, which might provide first hand information that could be utilized for making appropriate decisions in that regard. Although this study serves to narrow the research gap on expatriates working in the Asia-Pacific, it is far from being comprehensive and exhaustive. Future research in this area is needed to explore other aspects in many other countries of Asia that have not been studied. More studies on expatriates in Asia are definitely needed since increasing interest is observed for investments in this rapidly growing region of the world. Hopefully, the findings from this study will trigger greater research interest on expatriate management in Asia.

Development Of A Framework For Emerging Asian MNCs And A Model For Promising Local Enterprises To Migrate Onto The 'MNC Curve': An International HRD Perspective.

Gerald Z.D. Huang
Nanyang Technological University, Singapore

Increasing globalisation creates continuous challenges for corporations. In the new knowledge economy of the 21st century, as corporations surf the 'global wave', human capital will play a key role. This work-in-progress paper looks at the evolution of the global economy, impact of changes brought about by technology, communication and education. It also surveys the different approaches to management development adopted by American, European and Japanese MNCs. The paper aims to propose that if corporations are to survive the 'global wave', a different trajectory is needed – one that allows organizational flexibility, renewal, global integration and national responsiveness.

Keywords: Emerging Asian MNCs, Multinational Management, International HRD

As the world economy gets increasingly interdependent and interconnected, doing business as usual is not enough. Most industries of any significance have to be world-wide in their scope, and no company – no matter how large its home market base – is immune from the effects of the international environment. Jeffrey D Sachs wrote in the Global Competitiveness Report 1998,

"...with all of the ups and downs in specific economies and regions, the trend towards greater integration in the world economy continues unabated. This is especially apparent when we look at the underlying data concerning openness of national economies. As of 1998, every country in the sample has a currency that is essentially convertible for trade purposes...Globalisation is no illusion. It has gripped nearly every major economy of the world. Both trade and financial systems are opening up as never before in modern history. This is not to say that all will go smoothly – as the east Asian financial crisis demonstrates – but rather that the powerful economic, political and technological forces that are prompting the increasing integration of the world economy are continuing unabated."

For multinational and transnational corporations, the coming millennium will very likely begin with either a long list of unresolved issues or hopefully, the full benefit of the lessons learnt from the Asian Economic Crisis and it is imperative that corporations, especially Asian multinationals and promising local enterprises gear up and learn to dance to the new tune.

In Singapore, the Promising Local Enterprise [PLE] program was launched in 1995 by the Singapore Government, to help nurture strong local enterprises to become Asian MNCs. The Singapore Government aims to produce 100 companies (of a total of 300 in the scheme) with revenues of USD50millions by 2005, then groom them eventually into Asian MNCs with turnovers of USD200millions to USD250millions and with significant presence in at least four foreign countries.

However, before a corporation can build and manage an effective integrated network of world-wide operations, it must develop certain strategic and organisational assets. While some countries may offer certain location-specific advantages, the company must have strategic competencies to counteract the disadvantages of its relative unfamiliarity with foreign markets. One key contributing competency is the quality of the company's human capital. It is important that the company has organisational capabilities in order to be able to get better returns from leveraging its strengths internally rather than through external market mechanisms (Dunning, 1981). Thurow (1992) argues that technology is no longer an overriding factor in economic competition between nations because of the ease of capital mobility. National resources are also not as important a factor as they used to be, again because of the accessibility of technology. He argues that the most important factor affecting economic competitiveness is the quality of the workforce. In fact, the 1992 World Investment Report concluded that transnational corporations use ownership-specific advantages, together with the competitive pressures to internalise a wide range of value-adding activities rather than relying on so-called 'arms length' production. These internalisation advantages when combined with the location-specific advantages of host countries, provide a powerful stimulus to growth..

Review of the literature shows that the study of international business had focused on the environmental forces, structures, and institutions that provided the context within which MNC managers had to operate. Most of

these studies are deeply rooted in Western historical experience. The study of Asian MNCs is a relatively new field, with much to be learned. The focus of this research will be the multinational enterprise management structure and HRD practices, with particular reference to Asian MNCs and promising local enterprises. However, this does not suggest that the important and legitimate perspectives and interests influencing other key factors in the international operating environment will be ignored.

Evolution of the Global Economy

Dunning (1993), categorised the evolution of the global economy into five stages, each distinguished by a different configuration of the competitive strengths and weaknesses of firms, and their strategic response to them, as well as that of the competitive strengths and weaknesses of the Nation States and the strategic response of governments to them. The first stage, from the mid 19th century to the First World War, witnessed a revolution in production and organizational methods and new forms of transport and energy. Stage 2 of the evolution, from 1918 to the outbreak of the Second World War, is characterized by the maturing of both US and the European MNEs and a general move towards the integration of their affiliates into the economies in which they operated. Natural factor endowments together with Government imposed import restrictions remained the main determinants of the location of economic activity. Structural distortions in cross-border markets counteracted the technological and organizational advances of the era and severely hampered international plant specialization and intra-firm trade.

Stage 3, between 1945 and the late 1960s, saw the technological and economic hegemony of the US at its zenith and the international agreements forged at Bretton Woods and GATT were having their most dramatic impact on trade liberalization. As the significance of foreign production and the number of the MNE affiliates grew, the organizational philosophy of MNEs shifted from being mono or ethnocentric to being polycentric, with many companies replacing their international divisions by cross-border functional/product or regional divisions.. This was also a period in which Keynesian economic policies were in full vogue and governments were assuming a more important role in influencing national diamonds of competitive advantage (Porter, 1990). Towards the end of the period, the role of 'created' factor endowments (e.g. entrepreneurship, technology and human capital) was becoming a more important feature of the location attractions of countries, particularly among industrialized developed countries, between which the significance of intra-industry trade was also increasing.

The fourth stage, from the mid-1960s to the mid-1980s, saw an increase in the propensity of MNEs to integrate and control many of their cross-border activities and to take a more geocentric stance towards these activities. The period was also marked by a movement towards regional integration in Europe and, to a lesser extent, in Asia and Latin America. This allowed MNEs in those regions to rationalize their value-added activities and recoup some of the advantages of product and plant specialization and intra-firm trade.

By the mid-1980s, most developing countries were relaxing some of their restrictive policies towards inbound investment that had been a characteristic of the early and mid 1970s. This mainly reflected a shift in their macro-economic policies from import substituting to export led or balance of growth in these economies and/or the better understanding and expertise of governments in negotiating with MNEs. The period was also marked by a growth in alternative forms of international business involvement to that of the fully-owned foreign subsidiary, as well as a more pronounced heterogeneity of these forms across countries, industries and firms.

The fifth and current state of evolution of the global economy is essentially dominated by a series of dramatic changes in the world economic and political scenario. MNEs become increasingly aware of the need to be responsive to the local supply conditions, institutional systems and markets of the countries in which they operate, and how these, in turn, may be used to strengthen their own ownership-specific resources and capabilities. These factors and the response of MNEs to them also affect the configuration of the competitive advantages of nations. By the end of the 1980s, in the most advanced industrial economies, not only were natural factor endowments assuming a less important locational role and engineered factor endowments a more important role, but also the actions of governments, through their willingness and ability to affect the quantity and quality of these endowments and their organization, were assuming a new significance.

These developments cause realignment of both strategies of companies as they seek to remain innovatory and competitive in a global economy, and the macro-organizational strategies of countries as they seek to encourage domestic and foreign firms both to upgrade their indigenous resources and to use these resources more productively. The rise of MNEs from the Third World, the growth of cross-border strategic alliances, the increasing attention paid by governments to competitiveness as a goal in itself and the closer interaction between corporate and regional integration, are all illustrations of these developments.

In the early 1990s, the MNE continues to evolve into a very different sort of institution. It increasingly

assumes the role of an orchestrator of production and transactions within a system of cross-border internal and external relationships. From being mainly a provider of capital, management and technology to its outlying affiliates, each operating more or less independently, and then a coordinator of the way in which resources are used within a closely knit family of affiliates, the decision taking nexus of the MNE in the early 1990s has come to resemble the central nervous system of a much larger group of interdependent, but less formally governed activities aimed primarily at advancing the global competitive strategy and position of the core organization.

The Evolution Of MNCs In North America, Europe And Japan: Strategic Motivations.

Hymer (1976) and Kindleberger (1969) argue that enterprises invest overseas to exploit an "advantage" such as a unique product or process, a special knowledge, or certain management skills. The multinational corporation, according to Hymer (1979), was originally an American phenomenon. Between the end of the Civil War and America's entry into World War I, the United States had no significant benchmarks in the steady multinationalization of Corporate America because of its economic self-sufficiency. World War I changed that perspective. It pushed the larger oil, copper, nitrates, rubber, and aluminium companies into making irreversible commitments to foreign investments to ensure their companies' future. Foreign expansion by the consumer-driven companies such as General Motors, Goodyear, General Electric, and Du Pont was less urgent and therefore less aggressive. All these foreign ventures had the geographic spread to qualify as "MNC". Yet, in terms of corporate management and finances, they were really American companies with "subordinate" foreign branches that acquired their justification because they served some specific objective.

The real impetus to the multinationalization process in the industrial and service sectors developed during the late '50s. Between 1950 and 1965 US direct investment abroad increased nearly fivefold, from $12 billion to $55 billion. By the end of 1980 the total was approximately $220 billion. In addition, the advances in transportation and communication, the introduction of the computer, and massive rebuilding requirements in Europe coincided with the rapid growth of American MNCs. Perhaps more than any other single force, the Common Market stimulated multinationalization and service enterprises.

The reaction of European business was to join the multinational corporate system rather than to challenge it. European firms were already multinational and they gradually became better equipped for multinational operations as a result of mergers, nationalization, and growth, and they began to extend their international operations in other European countries, in underdeveloped countries, and even in the United States. Therefore, the MNC system was no longer an American system but at the very least became a North Atlantic system both in the sense that Europeans joined the MNC ranks and in the sense that American firms became less tied to the United States.

Traditionally, British and European capitalism has practised portfolio investment, loans, and similar forms of capital export. Although Great Britain and other countries did make direct investments in the nineteenth century, these investments were invariably infrastructure investments [utilities, port facilities, and railroads] (Hall ed., 1968). British investment was accompanied by mass migration of labor. Management, capital, and technology have gone as a package to foreign lands in search of labor, markets, and resources. Most of the original investment made by European countries to the USA was of the portfolio variety. Direct investments made in the US manufacturing sector near the end of the nineteenth century included capital from the British textiles, primary metals, and food and beverages, and from the Germans in chemicals, beverages, and electrical equipment.

The Japanese MNC, on the other hand, had a different motivation. The need to guarantee supplies of raw materials, the need to be cost-competitive (the rising wages, labor shortages, and an appreciating currency), and the need to secure access to the world market led Japanese firms to construct an extensive network of exploration and production abroad. Those activities were conducted by leading Japanese trade firms who were already multinational (Hymer, 1979). Many of these ventures do not take the form of the wholly-owned subsidiary or branch plant used by American MNCs. Instead, they frequently involve production sharing, guaranteed demand contracts, technical assistance, and portfolio capital.

Even after World War II, the Japanese continued their policy of not permitting foreign direct investment but of spending liberally for imported licenses of technology (Tsurumi, 1976). Their purchases of technology from abroad were considerable, yet at the same time they spent more than four times that amount on domestic R&D. Within a relatively short period of two decades Japan transformed itself into an aggressive world leader in many industries. The Japanese succeeded in breaking up the "package" of capital, technology, and entrepreneurship which foreign direct investment has most frequently entailed. They didn't need the capital; they got the technology without managerial control by American corporations, and entrepreneurship remained in the hands of the Japanese.

A Comparison Among American, European, and Japanese MNCs.

Although much cross fertilization took place between Americans and Europeans, and also between managers in developed and developing countries, subtle but noticeable differences still exist between the three groups of multinationals under consideration- Americans, Europeans and Japanese. They are different in their investment strategies, reaction to changes in host-government policies, and the selection and training of overseas managers. Scholars such as Nowotny(1964), Miller (1980), Negandhi and Baliga (1979), Negandhi (1980) Merwe (1980), Stening et. al (1980), Matsusaki (1980) have done comparative studies of American, European and Japanese MNCs from different perspectives.

Comparison on the Evaluation of the Performance.

According to Tsai (1997), the US multinationals, in general, seem to be operating with different definitions from those held by either their European or Japanese counterparts. To American managers, the cardinal principle of efficiency was the profitable production of quality goods and services at a price the consumer could afford or was willing to pay. This notion was continually reinforced by the home office, which rewarded the subsidiary on the basis of its annual bottom line performance. Thus, plant productivity, cost of goods purchased, and similar financial indices became the main concerns. The very legitimacy of overseas operations and their subsequent worth was seen in terms of operational efficiency.

In contrast, the Japanese and Europeans measured success or failure not so much in terms of the operational success of failure or in terms of the operational efficiency criteria used by American MNCs, but in terms of system effectiveness, i.e. the degree to which their organization was able to adapt to and cope with the stimuli emanating from the environment. In order to do so they were often willing to sacrifice some short-term operational efficiency. Furthermore, the home office often reinforced the policy of long-term effectiveness by stationing an expatriate manager in one country for substantial periods of time. The manager's role was evaluated not so much in terms of bottom-line profits as in terms of the ability to cultivate and maintain a harmonious interaction with host-government officials and others in the environment. In contrast, most US executives perceived such activities as a "waste of resources", contributing only to a decrease in efficiency and profitability. In fact, US subsidiary managers were rarely asked by the parent organization to cultivate interface and boundary relationships. Also, European and Japanese executives were given enough leeway and freedom to set their own targets in a given country, while US subsidiary executives were programmed by their headquarters to produce, sell, and make profits at certain levels.

Mentality Differences

Another characteristic displayed by US executives was their misguided notion that they were doing the host nations a big favour by their presence (Negandhi, 1979). In contrast, European MNCs, according to Franko's (1976) study, encouraged a highly adaptable attitude. The Japanese multinationals' overall attitude toward host nations was even more conciliatory than that of the Americans and Europeans. Japanese MNCs generally emphasized their role in contributing to the overall welfare of their host and home countries. They seemed to believe that each and every one of them has a national responsibility to secure resources for Japan, to provide opportunities for small manufacturers from Japan to invest overseas, to sell their advanced technology, and to help host nations achieve their own socio-economic objectives. Such a 'collective' orientation, in contrast to the 'individualistic' orientation of the US executive, strongly reflects Japan's national heritage and religious beliefs (Kitagawa, 1976).

Human Capital And International HRD

Harvard Business Review World Leadership Survey (1991) revealed that corporate executives display keen awareness of the importance of human resources in organizations. According to the survey respondents, the most important elements in corporate success are customer service, product quality and work skills. All three factors are heavily dependent upon human capital – the education, training and motivation embodied in people. The increasing importance of human capital, coupled with changes in technology, consumer demand, demographic composition of workforce and in global competition will have a continuous impact on the role of HRD activities. Once considered to be the most stationary factor in production, human capital now flows across national borders as easily as cars, computer chips and corporate boards. In the next century, the world's workforce will become even more mobile, and employers will increasingly reach across borders to find the skills they need (Johnston, 1991). In a global organization, the human resource challenge becomes recruitment, selection, training and development, and supervision planning on a global scale from global sources. Global and cross-cultural training and career-path

planning becomes necessary for managers in the global corporation, regardless of their domestic or international assignments (Rhinesmith, 1991).

In reality, most managers are, however, nearsighted (Ohmae 1989). Too few managers consciously try to develop plans and build organisations as if they saw all key customers equidistant from the corporate centre. Effective transnational operations require a genuine equidistance of perspective and to succeed in the international operating environment of the 1990s and beyond, managers must be able to sense and interpret the complex and dynamic environmental changes; they must be able to develop and integrate the multiple strategic capabilities; and they must be able to build and manage the complicated yet subtle new organisations required to link these sensing and response capabilities, and deliver co-ordinated action on a world-wide basis. According to Bartlett and Ghoshal (1995), there are three core roles and responsibilities that almost always fall to these key managers: world-wide product or business strategist, architect of world-wide asset and resource configuration, and cross-border co-ordinator and controller. They suggest that in the 1990s, the competence of a firm to develop and manage a cross-border network of separate but interrelated value-added activities will be the key factor determining the success in the global competitive environment. Such a competence, they argue, is three-pronged. First, it involves taking full advantage of the economies of scale and scope arising from global integration. Second, it involves a flexibility and proper appreciation of differences in the supply capabilities and consumer needs in different countries. Third, it involves using the experience gained in global and national markets to strengthen the resource base of the firm as a whole. To achieve such a balance between globalization, localization and learning experience, the traditional MNC organizational structure, with its hierarchical pyramid, subsidiaries and world headquarters, will gradually evolve into a more fluid and integrated network to adapt to strategic and competitive imperatives. For multinationals to survive in a dynamic environment, it also has to have in place, a renewal process involving all levels of management – straddling the entire human capital spectrum

Organizations, however, find various aspect of globalization difficult since the international management literature so far does not provide much guidance. With regard to international HRD, Ronen (1989), concluded that the limited quantity and quality of pertinent literature was the biggest obstacle to pursuing the task of identifying the behavorial characteristics, developing the optimal skills and evaluating the HRD techniques for this purpose. Mendenhall and Oddou (1985) concluded that available knowledge of the cognitive dynamics of international assignees' cross cultural adaptation processes is quite limited.

Research has shown that management methods and managerial knowledge are culturally sensitive and are based on the national identity of managers. But there exists a research gap in the field of management development technology. Also, very little research has been done on the design and delivery aspect of international management development programs which consider the national clusters and cultural aspects of managers' backgrounds. One study looked at the perceptions of MNE managers from 32 different countries on various HRD issues related to the transfer of management technology (Osman-Gani, 1991,1993). It identified several country clusters from the response patterns of managers from various countries, and discussed the implications for design and implementation of cross-cultural HRD programs. Evidence suggests that the national context of a firm's operations plays a significant role in shaping organizational practices, irrespective of the national ownership of the company (Brewster, 1995). Sparrow, Schuler, and Jackson (1994) also identified clusters of countries showing how organizations in different parts of the world operationalize human-resource management differently as a result of environmental pressures.

On the other side of the coin, multinational parent companies also exert influence over their subsidiaries by introducing home-country practices into host countries, irrespective of local conditions. This is evident in the work of Hedlund and Aman (1984) who looked at Swedish multinationals, of Tsurumi (1986) who studied Japanese companies, and of Stopford and Turner (1985) who argued that US multinationals introduced US styled personnel practices to Britain via their British subsidiaries. Yet, research examining the failure of multinationals in overseas operations would suggest a need to adapt management practices as opposed to imposing them abroad (Gleave and Oliver, 1990). Olga (1998) revealed considerable support for proposing national context as a key determinant of MNE practice over parent's national origin. His findings do suggest that the role of the national origin of the parent in shaping MNE practice is less important than the literature suggests – at least, in relation to HRD practice.

International Management Development

Internationalisation, therefore, has deeper consequences on the concept of management itself. Deeply rooted "one-best-way thinking" has been shattered by the awareness that there are different and equally effective approaches to management and organisation. Twenty years ago, "good management" was synonymous with the American approach. Decades later, new approaches and challenges have surfaced in the form of the Japanese model, the "German challenge" and the Swedish model. We are still in the process of discovering that there are as

many different approaches to management as there are national cultures. Evans, Laurent and Doz (1989) maintain that each of these nations has discovered and built upon some aspect of the complex reality of management, though often this concern becomes obsessive and pathological. Aharoni (1966) and Carlson (1966) used a clinical methodology to examine the FDI process from a more managerial perspective. Others like Stopford and Wells (1972) and Franko (1976) built on the seminal work of Chandler (1962) defining the archetypical strategies and structures that had allowed MNCs to expand. Several doctoral dissertations (Prahalad 1975; Doz 1976; Bartlett 1979), examined the nature of the management process in MNCs, though these studies centred primarily on American MNCs. Research on European MNCs was conducted by a group of researchers at the Stockholm School of Economics. Over time, this group focused on the nature of headquarters-subsidiary relationship and provided new insights into how world-wide operations were co-ordinated and controlled (Otterbeck (1981); Hedlund (1978,1986). In general, very little research has been done on Asian MNCs.

Porter (1990) popularised the idea that nations have competitive advantanges and stopped short of the key question of why certain nations develop competitive advantage and others do not. Dunning(1993) argued that Porter underestimated the significance of the globalisation of production and markets for the competitive advantage of nations. This is because the increasing interaction between the cross-border value-added activities by multinational enterprises will directly or indirectly impinge upon national competitive advantage. Hofstede, Franke and Bond (1991) work, building upon three comparative studies providing measures of national culture, may shed some light on this issue. Their thesis concluded that differences in cultural values, rather than in material and structural conditions, are ultimate determinants of human organisation and behaviour, and thus of economic growth. Hofstede (1980,1991) undertook the most classic study of cultural differences and identified five dimensions where cultures differ: (a) power distance, (b) uncertainty avoidance, (c) individualism, (d) masculinity and (e) time. Kluckhohn and Strodtbeck (1961) developed a framework of six dimensions to describe the values orientation of a culture as, (a) relation to nature, (b) time orientation, (c) basic human nature, (e) relationships among people and (f) space orientation. Trompenaars (1993) describes national cultural differences using seven dimensions: five are about how people relate to others, the sixth is time orientation and the final, relationship to nature. It is to be noted that in discussing the relation of culture to the study of organisational behavior, organisational theories developed in the West may not apply in Asia because of cultural differences. As the world becomes increasingly better interconnected, the implication for managers is that understanding culture is becoming a critical management skill.

Cultural Traditions In Management Development

This paper will proceed to review how companies in different cultures actually manage their executive development as they position themselves for the global transnational environment. According to Evans, Lank and Farquhar (1989), there is no established one best way of tackling management development. Focusing on the development of those persons with high potential, they labelled these – the Japanese model – "elite cohort approach", the Latin model – "elite political approach", the Germanic model – "functional approach" and the Anglo-Dutch MNC model – "managed development approach".

Singapore Companies - Strategies For Future Competitiveness

Singapore was ranked first in the 1998 World Economic Forum Global Competitiveness Report, followed by Hong Kong and the United States. The overall Competitiveness Index is built upon the average of eight factors: Openness, Government, Finance, Infrastructure, Technology, Management, Labor and Institutions. The Committee on Singapore's Competitiveness (CSC) was formed in May 1997 to assess Singapore's competitiveness over the next decade. Among its strategic recommendations are proposals for Singapore companies to leverage on human capital and achieve the status of world class corporations.

Research Methodology

Using the models conceptualised by Bartlett and Ghoshal for transnational corporation renewal, and Osman-Gani for transfer of management technology, as platforms, this exploratory study will seek to find a different trajectory for emerging Asian MNCs and promising local enterprises to leapfrog into the 'next lap'. The study will be conducted using the following approach:

- Interviews with executives of selected MNCs (Japanese, Korean and Singaporean) and a group of promising local enterprises (PLEs).
- Survey of PLEs and MNCs in Singapore, Japan and Korea.
- Focus group discussions with Chief Executive Officers of Promising Local Enterprises.

- Case studies of a sample of MNCs from North America, Europe and Japan.

Research Questions

This research attempts to address the following questions:

1. What HRD strategies are being followed by Western MNCs (American and European) in their development path?
2. What are the nature of similarities and differences in HRD strategies adopted by Western and Asian MNCs?
3. What are the social and cultural implications of the similarities and differences?
4. What are the strategic motivations for emerging Asian MNCs and promising local enterprises to aspire to go international?
5. How can Promising Local Enterprises achieve the synergistic effects of the combination of the two models identified under the research methodology?
6. Can Promising Local Enterprises ride on the Government's policy directions?
7. What HRD strategies should be followed by Promising Local Enterprises to become emerging Asian MNCs?
8. What HRD strategies should be followed in developing a cadre of global managers?

Expected Results

It is hoped that the intensive literature review, case studies, interviews and surveys, while bearing answers to the research questions raised above, will also reveal the similarities and differences between Western and Asian MNCs. The uniqueness of the Asian corporations, the author believes, will also stand out. It is also expected that, given the speed of change in the international business environment and the impetus provided by the Singapore Government, the local promising enterprises will have to take a different trajectory. Following the traditional growth patterns of the traditional MNCs will simply not be adequate. In the process, we will develop the 'migration path' for emerging Asian MNCs and Singapore PLEs.

Contribution To New Knowledge In HRD

This research aims to enhance the existing general pool of knowledge on HRD in MNC management by:

- Adding the Asian framework for emerging MNCs and in relation to the small and medium enterprises.
- Develop a "migration framework" for promising local enterprises to go on the MNC curve.
- Identifying 'renewal' framework for companies to survive in the new economy.
- Highlighting new insights into differences of MNC management between East and West.
- Generating further research questions on developing truly global ('stateless') managers.

Note

For the purpose of this research, the words international, multinational, MNC, multinational enterprise and transnational corporations have been used interchangeably.

The Framework and Practices of Cross-Cultural Training of Taiwanese Corporations

Hsinyi Chen
National Dong Hwa University

Menling Wu
National Central University

This paper reports the findings of a study that investigated the practices of cross-cultural training of high-technology corporations in Taiwan. The results showed that nearly one-third of the corporations had cross-cultural training programs. The training methods, the contents of the program, and the reasons for them to implement the programs or not were also discussed in the study.

Keywords: Cross Cultural Training Technology Training

With "the Taiwan Experience - the Economic Miracle", the amount of outward investment by Taiwanese corporations is tripled what was five years ago. The environment Taiwanese corporations now faced is one in which they must deal with not only single culture but multiple cultures. Research has shown that management style, learning style and value systems are different in different cultures. Both HRD practitioners and researchers must find a new way to help organizations operate in a global context. Cross-cultural training is one of the methods. As the economic power of Chinese Taipei grew over the last decade, more Chinese enterprises made direct investments or set up subsidiaries in other countries. To help the expatriate adapt the other culture, and also let the foreign employees understand the corporate culture, cross cultural training is just getting the attention in the field of HRD both in the industries and the academy.

The purpose of this study is to investigate the practices of cross-cultural training in Taiwanese corporations and to develop or justify a model of cross-cultural training. Three research questions were answered in the study:

1. What is the content of cross-cultural training in Taiwanese corporations?
2. What are the problems that occurred in the cross-cultural training programs?
3. What are the reasons that not implementing cross-cultural training?

Methodology

A questionnaire was used to determine what practices of cross-cultural training were carried out in Taiwanese corporations. Three parts of questions - the practices of cross cultural training, the reasons for not implementing cross cultural training, and the demographic information were asked in the questionnaire. The sample was concentrate on high-technology corporations, since a high percentage of Taiwanese multinational corporations are in the electronic industry.

Ninety-nine Taiwanese multinational companies in high technology industry were selected to conduct the survey from the following criteria:

1. 214 high-technology companies were selected from the Top 1000 corporations published by Taiwan's "Common Wealth" in June 1997.
2. 87 of the 214 selected companies had registered the outward investment in the Industrial Development and Investment Center of the Ministry of Economic Affairs.
3. After double-checked by phone with the 214 companies, 12 companies also had oversea subsidiaries that were not shown on the official record.

The survey was conducted from February 1998 to April 1998 in Taiwan. The questionnaires were distributed to the HR managers in the headquarters of the selected corporations. The over all response rate was

Copyright ©1999 Menling Wu & Hsinyi Chen

64.65%. Out of the 65 returned questionnaires, 7 did not have completed demographic data. After excluding these incomplete questionnaires, the response rate was 57.6%.

Findings

The results of the expatriate duration, length of training, training methods, contents of the program, problems with implementing cross-cultural training program, and the reasons for not implementing cross-cultural training are described in the following sections.

Table 1 shows the expatriate duration. The results show that 64.7% of the companies sent their employees overseas more than 1 year. The research also found that about 31.6% of the electronic companies have overseas subsidiaries has cross-cultural training program

Table 1. Expatriate duration

Expatriate duration	Percentage(%)
1-month & below	11.8
2-month to 1-year	23.5
1~2 years	52.9
2~3 years	5.9
3 years & above	5.9

Table 2 shows the length of the cross-cultural training program. Most of the cross-cultural training programs are on-day training. 17.6% of the companies offers 2-day training while 23.5% of the companies has 3-day training programs.

Table 2. Length of training

Length of training (day)	Percentage(%)
1	52.9
2	17.6
3	23.5
4	0
5	0
6 and above	5.9

The degrees of expected interaction and similarity between the native and host cultures determined the cross-cultural training method (Tung, 1981; Mendenhall, Dunbar, and Oddou, 1987). Table 3 shows the cross-cultural training methods. Area briefings, books, lectures, and films are the four most often used training methods. The methods are information giving approach or didactic-information training (Mendenhall, Dunbar, and Oddou, 1987; Ronen, 1989). Case studies, cultural assimilators, and role plays belong to affective approach. The approach is great useful to the expatriate who want to stay in the foreign country for more than 2 months (Mendenhall, Dunbar, and Oddou, 1987). If the individual is going to a different host culture and the expected degree of interaction is high, the immersion approach is a suitable training method. In the study, sensitivity training and simulations belong to the immersion approach. From the results, we know that most of the corporations used the information giving approach to train their expatriates. To help them adapt to the different culture easily, cross-culture skills might be the next considerations for the corporations.

Intercultural business skills, cultural shock management, life-style adjustment, host-country daily living issues, local customs and etiquette, area studies, and language learning strategies topics are useful in the cultural adjustment process (Blocklyn, 1989 ; Black,Gregersen, and Mendenhall, 1992; Briscoe, 1995; Harris and Moran, 1996). Table 4 shows the content of cross-cultural training course. The first five courses includes area studies, cultural awareness, business related skills, language ability, and technical competence. It quite covered the content that mentioned from the previous researches. Since Families' adjustments and supports is one of the most important

factors for the successful expatriation (Black and Gregersen, 1991; Harris, 1989; Tung, 1987), the course for family adjustment should get attention in the HR department.

Table 3. Cross-cultural training methods

Training methods	Percentage(%)
Area Briefings	23
Books	16
Lectures	15
Films	11
Case Studies	13
Culture Assimilators	8
Sensitivity Training	5
Role Plays	2
Simulations	2
Others	5

Table 4. Content of cross-cultural training course

Content of the courses	Percentage(%)
Area studies	94.1
Cultural awareness	76.5
Business related skill	70.6
Language ability	70.6
Technical competence	64.7
Cross-culture communication	58.8
International manner	52.9
Stress management	52.9
A sense for politics	41.2
Field trip	41.2
Family orientation	17.6

Table 5 shows the problems with implementing cross-culture training. The first four difficulties that the companies running the cross cultural training programs are: the trainers who have significant international background and experience are insufficiency; lack of time because of the immediacy or the need for the manager overseas; not enough trainees to have the class; training programs are easy to be devised.

Table 5. Problems with implementing cross-cultural training

Problems	Percentage(%)
Lack of trainers who have significant international background and experience.	26.2
Lack of time because of the immediacy of the need for the manager overseas.	23.8
Small number of expatriates, insufficient to form a class.	14.3
Training programs are not easy to be devised.	11.9
There are doubts about the need for such specialized.	9.5
The belief that cross-cultural training programs are not effective.	9.5
The shortage of budget expenditure for cross-cultural training.	4.8

Table 6 shows the reasons for not implementing cross-cultural training. The first four reasons for the companies that didn't have the cross cultural training programs are: the trend towards employment of local nationals; the

temporary nature of many such assignments; there are doubts about the need for such specialized, and there is a belief that the competencies of expatriates are enough to complete the assignments.

Table 6. Reasons for not implementing cross-cultural training

Reasons for not implementing	Percentage(%)
The trend towards employment of local nationals.	16.85
The temporary nature of many such assignments.	13.48
There are doubts about the need for such specialized.	13.48
There is a belief that the competencies of expatriates are enough to complete the assignments.	13.48
The dimensions needed for successful acculturation are not well enough to known to devise sound training programs	10.11
Lack of time because of the immediacy of the need for the manager overseas.	8.99
The shortage of budget expenditure for cross-cultural training.	6.74
The trainers who have significant international background and experience are insufficiency.	5.62
The belief that cross-cultural training programs are not effective.	2.25
Others	8.99

Conclusions

The results show that nearly one third of the corporations offered cross-cultural training program to the expatriate. The length of training for 93.7% of the corporations is less than 3 days. Most of the training methods they used belong to the information giving approach. It seems that the approach did not adjust by the length of stay. Affective and Immersion approaches should be used to increase the degrees of integration. Doubts about the need for cross-cultural training programs are one of the major reasons for the corporations that did not offer the programs. From the previous research (Tung, 1982; Conway, 1984), we know that the cross-cultural training reduced that rate of failure expatriation. Hopefully, 35.9% of the corporations that are not implementing cross-cultural training will consider such training in the future. As 76.9% of the respondents thought cross-cultural training is a worthy investment, the cross-cultural training will get much more attention in Taiwan.

The empirical study of cross-cultural training in Taiwan is in its infancy. Few reported studies offer recommendations. Existing research consists of descriptions of the training program or reports on the program from the expatriate's point of view. Cross-cultural training should be highly valued as a means of making the enterprise increase its competitiveness in the global market.

Knowledge Management and Knowledge Dissemination

Wim J. Nijhof
University of Twente

The importance of knowledge in companies has increased in the last ten years. Knowledge seems to have become more important than labour, capital and raw materials. It is true that in many western countries, but also in Asia, societies are growing into service oriented labour markets. Many authors perceive a huge growth in service sectors. Many experts see a world in which people exist by the exchange of information and knowledge, in which knowledge is not only a tool to work with, but also a sellable product. This fact as such is not new; what is new is the fact that for so many people it will become a new job : the knowledge worker. In two case studies an exploration takes place of strategies companies use in sharing and disseminating knowledge and expertise between employees.

Keywords Knowledge Management, Learning Organization, Technology

Introduction

The demand of knowledge intensive services is growing so rapidly that companies are producing more and more services instead of goods. Manual and craft sectors are going to change into intellectual work: from handwork to brain work and the life cycle of products is going to be shorter. Designing and developing intelligent products and processes are becoming more important, also because of cost- benefit ratios. Organisations must act and be pro-active as fast as possible to changing demands and technological growth (Sogtoen, 1996). Knowledge management, therefore, is a consequence of a changing paradigm - from an industrialised toward an information based economy. Some writers, like Drucker (1993), see a three stage model in which the importance and relevance of knowledge is increasing:

- the industrial revolution in which application of knowledge leads to new products and tools; concentrating of this type of work became visible in big factories;
- production revolution in which knowledge is connected to work; scientific management(Taylor) is the scientific expression of this leading to more efficiency and productivity;
- The third phase - we are in the middle of this - is marked by the connection of knowledge to knowledge. This phase is characterised by the focused use of knowledge and expertise, systematic and targeted to solve problems.

Human resource development in companies is dependent of this kind of developments. What will be the needs for trainees and employees in terms of knowledge and expertise? What are the new job requirements in terms of handling these new skills? How should a company profit from this? Before analysing two cases from business and industry introducing strategies for knowledge management some important concepts have to be defined: data, information, knowledge and expertise, because these concepts play an essential role.

Data, Information, Knowledge & Expertise

It is not easy to define the four concepts. For the sake of a clear understanding we will not now go into a semantic analysis or a hermeneutic analysis of all possible meanings. We simply define three levels :

- data: simple registrations and observations, without special meaning (i.e. a telephone book);
- information is giving meaning to data
- knowledge: information that has been taken up in a frame of understanding and will be handled by the user.

The concepts of expertise and competence are used in this text as interchangeable with knowledge, while the cognition and skills needed to carry out a certain task within a company can be interpreted as the knowledge structure. Procedural and declarative knowledge is needed to solve problems and are based also on factual and

Copyright © 1999 Wim J. Nijhof

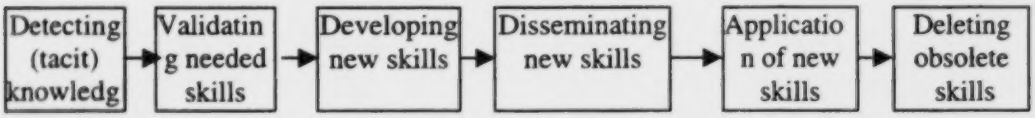
conceptual knowledge. Competence in this context means the ability to use knowledge, especially when related to the use of systems (i.e. computer programs, manuals, information systems). Competence is connecting people and systems: together both people and systems are competence (Sprenger, 1995). Added value, as a consequence of connecting people to systems, is the output of competence and conditioned by the worker. Electronic Performance Support Systems (EPSS) is one of the possible operationalisations of competence (Bastiaens, 1997). What then is knowledge management?

Knowledge or Expertise Management

Basically, knowledge management is the process of making explicit the tacit knowledge of employees to optimise the effectiveness of the knowledge chain in a company. Knowledge management is also not focused on one person; the target is the organisation, optimising the performance of the organisation at three levels: individual, process, and organisation (Rummler & Brache, 1995).

In all of these we find opportunities for interface management, which can be defined as knowledge management - detecting existing knowledge, validating the necessary knowledge and skills, developing new knowledge, disseminating, applying and deleting (old and obsolete) knowledge.

Figure 1: The knowledge chain (Weggeman & Boekhof, 1995)



Knowledge management, according to Weggeman & Boekhof (1995), creates a more intelligent organisation, competent and very conscious of expertise and critical issues. Knowledge management (KM) is essential for all parts of the company: for Human Resource Development and Management, the organisation of knowledge, the application of knowledge, barriers to and opportunities for using knowledge (Wiig, 1993). Human Resource Development (HRD) and Human Resource Management (HRM) are usually departments using a set of interventions to unleash human competence or to guide the organisation to better performance. Different sets of instruments can be used for this: knowledge technology and knowledge creation (Van der Toorn, 1996).

Knowledge Technology

This type of technology is focused on the use and availability of knowledge and is related to taxonomies and the detection of available knowledge and their dissemination and use. To see whether knowledge can be used, it is important to know where and how knowledge has been stored. In analysing stored knowledge it is possible to find out where the knowledge is and who is working with it. Different types of storage of information and knowledge can be distinguished:

- knowledge in people (human knowledge): difficult to externalise and bound to human beings;
- mechanised knowledge in machines and apparatus (hardware), useable but restricted knowledge;
- knowledge in documents: books, manuals, and guidelines, job aids, etc. This type of knowledge can be found easily, but is not used on a daily basis;
- automated knowledge in electronic (support) systems; normally containing information and knowledge for diagnosis, design, therapy and planning. These systems normally function as decision oriented systems or management systems. (Boersma, 1993; Sprenger, 1995; Van der Zee, 1992).

Managing the interaction of the four types is a kind of knowledge management in an organisation. If a manager is willing to change one of the parts, it will have an effect on the other ones.
The storage of knowledge in those different parts of the system seems to be dependent of the type of knowledge. Many organisations have the feeling that knowledge really is a part of the organisation, when it has been documented.

Nonaka (1991) and Nonaka & Takeuchi (1995) introduced the concepts of "explicit and tacit knowledge". Explicit knowledge is formal, systematic knowledge, which can be communicated through languages and can be documented in procedures, product specifications and scientific and technological principles.

Implicit knowledge, however, is knowledge based on experiences. It is subjective, not always and easy to explain in formal language, rooted in actions and commitment of people in a certain context. This type of knowledge has two components: a technical and a cognitive component. The technical one is called "know -how" or "Spitzengefühl" (an intuitive kind of knowledge); the cognitive component consist of mental models, beliefs and perspectives. It is an attitude and an implicit way of looking at reality. How can we grasp the implicit knowledge or make the hidden knowledge visible? Different techniques exist like case base reasoning, task analysis, critical incident technique, and adoption and knowledge acquisition techniques. All of them are time consuming and none of them will ever lead to a fully understandable and complete documentation of all the hidden knowledge. Therefore scientists are looking for modes of dissemination within an organisation, using strategies to disseminate knowledge. Sadler & Miller (1993) name four strategies:

1. Dissemination of knowledge through co-operation in teams and projects;
2. Extracting knowledge from people, documenting and storing the knowledge in archives and files;
3. Institutionalising knowledge by using a machine bureaucracy;
4. Creating material and social exit barriers (working climate, rewarding systems).

Implicit knowledge might be understood better through informal communication. Classical forms of on- the -job learning use the modelling principle through which a tutee observes the tutor in solving problems, picks up the key problem solving skills, the sequence, the tools, and the contextual sense and feeling of craftsmanship and expertise. The (body) language and the level of communication are thus very important. Meaningful communication between expert and novice, between expert systems and users, between tutor and tutee, between master and apprentice, are based on mutual understanding both verbal and non verbal.

Knowledge Creation or Knowledge Generation

Part of the knowledge diffusion problem is connected to knowledge use. Using knowledge in a context often means moulding the knowledge and generating new insights on the basis of new experiences, through interdisciplinary co-operation, problem solving capacity, entrepreneurial behaviour and co-operation.
Diffusion of knowledge is often more diverse and linear, whilst knowledge generation is circular and complex. This process can take place between people, machines, systems, and documents.
According to Sprenger (1995) knowledge generation can take place in different patterns:

- Application: using standards problems and routines
- Adaptation; optimising existing procedures for problem solving
- Exploring and discovery; developing new techniques and problem solving procedures, (sometimes leading to new patents).

Besides the use of knowledge, the creation of knowledge is related to added value and growth. Knowledge creation is connected to getting new knowledge and development through reconstruction of existing perspectives and assumptions (Nonaka, 1991). Nonaka gives the example of designing a new car (the Honda Civic) as a solution for people in big cities. It is a small car, very flexible, very mobile, with the largest volume (as a consequence of the "egg form"), but very comfortable.

At that time, it was a revolutionary concept, which was later imitated by many carmakers. This process was related to designing a new product, but Nonaka uses the example to show that four basic processes took place:

Socialisation: through which tacit knowledge is transferred into tacit knowledge (norms, values, attitudes) by using observations, language, imitation or exercises.

Externalisation: through which tacit knowledge is transformed into explicit knowledge in using images or metaphors

Internalisation: by which explicit knowledge is transformed into tacit knowledge. This is the more traditional type of learning processes (see the work of Piaget);

Combination: the exchange of explicit knowledge; exchanging existing knowledge.

Figure 2: Knowledge creation strategies according to Nonaka (1991)

from\ to	**Tacit knowledge**	**Explicit knowledge**
Tacit knowledge	Socialisation	Externalisation
Explicit knowledge	Internalisation	Combination

However insightful this matrix may be, there is a long way to go to build an HRD and HRM system in which these four strategies, in combination with the storage of information, can be used effectively to create a high performance organisation. The role of knowledge management is mostly connected to the explicit kinds of information and knowledge exchange. In the case of experts, some companies have tried to track down the expertise and capture it for the benefits of the companies, especially in companies where employability of older workers is a real problem. Some experiments took place in the Netherlands to keep and save the tacit experiences, skills and process knowledge in, for instance, the service sector (for example the very efficient problem solving skills and colour mixing skills in the textile industry.

Another motive is related to cost saving. On the job training is often based on cost saving arguments (Van der Klink, 1997; Jacobs, 1995). Using on- the- job training as a training strategy, employees have to learn by observation, by learning by doing, on an individual basis. Keeping people away from off- the- job training does save a lot of out- of- pocket costs. But does it deliver better internalised knowledge and competence? And, does it lead to return on investments and to transfer of knowledge? (Phillips, 1995; Gielen, 1995).

Task complexity can be the prime motive in seeing whether the Nonaka strategies can be used effectively. For easy and routine kinds of tasks it is difficult to recommend complicated strategies. Informal learning and acquiring implicit knowledge is quite easy and it is relatively simple to observe how people act (Bastiaens, 1997). Complex tasks, however, demand integrated use of knowledge. In these cases, hidden or implicit knowledge, can play a big role in reaching a degree of competence.

Organising and designing a working environment as a learning environment can stimulate the creation of new knowledge in which implicit or hidden knowledge can grow. The ideas of the learning organisation (Senge, 1990; Watkins & Marsick, 1991) and also experiments with the 'Leittextmethod' in Germany and the Petraproject with Siemens, make clear that new pathways of learning and working, that new border crossings (Engeström, 1994) will take place, in which people will construct new knowledge and performance through co-operation, communication and assessment (Barnes & Todd, 1977).

Not every employee might be capable of understanding implicit knowledge as not every student is capable of understanding in a very explicit way the formal knowledge transmission. The way knowledge has been codified, the way knowledge is accessible, the characteristics of the employee as a learner, inventor, communicator and user of knowledge, are very important factors in understanding the processes of organising knowledge management in organisations.

In the next section, two cases will be described in which companies have designed procedures and instruments for knowledge management. It will be clear from the information that follows that these cases are starting in a zero phase.

The research questions that we are interested in are:

a) What is the motive of the company to go into knowledge management
b) What type of knowledge management does take place?
c) What are the effects of introducing knowledge management?

Case 1: Designing a Tool for Knowledge Management (Dutch Telecom)

Dutch Telecom decided to set up a study in 1992 to develop a tool for expertise management. The concept of expertise is based on a combination of knowledge, attitude and skills. Having expertise available at the right moment, at the right place, is a precondition for Telecom to carry out services. This is a requirement for existing, as well as for new tasks and services. Using expertise is one of the ways to optimise performance of the organisation (Hoekstra, 1995, p. 4). To find the expertise and to manage the expertise can be an asset to the organisation.

Benchmarking procedures can help to find out whether expertise management will lead to a better performance, when compared with competitors. Managing expertise will therefore be focused on:

- defining expertise per task and per division
- describing the importance of a task and service
- what expertise can be found and where
- who are the best carriers for expertise
- what is the gap between necessary needed and existing expertise
- what are the best solutions for this problem?

The main task for Dutch Telecom is to design a tool for detecting expertise. For such an instrument, requirements or specifications should be formulated: functional specifications, operational specifications, frame factors and requirements, and design restrictions. Well, it is clear that

- the tool must fit with the goal of expertise management.
- the tool must be generic in the sense that all divisions within Dutch Telecom can use it.
- there must be a tool that can be customised to the setting.
- the tool should be transferable to HRD officers within Telecom
- the tool should be user friendly and transparent, consistent, not complex.
- the interdependence of stages in finding expertise should be restricted
- the tool must fit with the management style of Dutch Telecom
- the tool has to be ready within 6 months

To set up a tool a case was chosen within Telecom - a satellite station in the Northern part of the Netherlands. This station is the largest satellite station in Europe and connects all the communications all over the world (telephone, tv-signals, ship communication, airline communication). It is a relatively small size case because of the limited number of 40 people working there: mainly technicians for the operation and the maintenance of the satellite station. It has to function 24 hours a day, 7 days per week. There are five business units, covering different parts of the market e.g.consumermarket, business, network, international telecom, and telematic systems. The satellite station is part of International Telecom.

Within the station different groups are working on different tasks. It was decided by the manager to study a special group of people who were responsible for the maintenance of the transmission group. This group is a merger from two older ones: a service and maintenance analogue group, and a digital group. Both groups have experiences with different systems but the new tasks will be the responsibility of the whole group (analogue and digital). Administrative tasks are also part of the responsibility. Monitoring the satellite and transmission services is the main task to carry out.

Within the study of expertise detection the problem has to be defined. In the satellite station 4 monitoring groups are available. The monitoring service is organised in such a way that a person has to be available 1 week out of four. In the near future every employee should take part in all the systems available. The manager is planning a system in which everybody can carry out a service once in eight weeks. The conclusion is that every employee is capable of handling all the systems. It is now necessary to know which expertise is available and how the new expertise can be learned.

In the old situation all the expertise of all the systems is stored in one or two employees. This is a very vulnerable situation and reason to change over to a fully equipped staff with expertise. How can the staff move from a 1:4 toward a 1:8 monitoring service?

What are the problems in detecting expertise?

- What is the level of expertise needed for the monitor function? Is the employee capable of solving all problems, in which case high expertise is required. The alternative would be that the safeguard person only needs to understand how to keep the system active, for instance in using bypasses.
- There is no insight in the diagnostics, no records of breakdowns and there is no systematic log file. Information is handed over informally sometimes.

There is no clear concept of and understanding of what is exactly needed.

After a presentation of the preliminary findings the manager has taken the decision not to take up all the systems for monitoring in the study, but just one. This was problem solving by piece meal engineering: take just one function of the system: Intermediate Data Rate (IDR)(an analogue system).

To have a full insight in the type of work of maintenance and service of IDR, all workers have been interviewed. Nobody was fully informed, nobody had an overview. In gathering all the pieces together and trying to talk to former managers of the division, a picture of five functions became visible:

a) constructing connections
b) testing connections
c) maintenance
d) alarms
e) documentation

All these functions have to be done according to technical rules and specifications. One of the assumptions of the researcher was that all the information could be collected and documented to make it available for all, but very soon, this picture was broken down:

- Sometime it is not only the yet incapability of workers to formulate precisely, but also mistrust. Losing expertise means losing power. This might lead to re-engineering of tasks and clusters of tasks.
- The effect is uncertainty and unwillingness to change;
- Using flow charts proved to be an effective means in mapping the task, functions and chains of decision making.
- On the basis of these cognitive maps the knowledge, skills and attitudes could be detected.

For this type of case it is important to know what the real reasons are and what the best tools and techniques are to detect the adequate skills (cognitions, attitudes and psycho motor skills).

These skills will be used for figuring out the gap between demanded and offered skills in using a questionnaire for self-assessment of needs. But even this instrument proved to be a threat to the employees. Just 50% of the respondents of this department (n= 16) responded. Interviewing might have been a better instrument to use. However, there was some response on different functions:

- Maintenance seems to be not applicable
- Constructing connections is important to four persons
- Testing connections is an average need for the total group
- Alarms and documentation are functions not being covered and mastered by the group

While all the employees have to work with all the functions, just 50% of the group is capable doing so in just two functions. So how is the learning gap to be bridged? Teamwork, transmission by colleges, reflection in teams after work, is the means proposed by the management. From interviews, however, it is known that the members of the IDR team do not co-operate. The expertise is exists, but will not be transferred. Not even reflection takes place. Evaluation of his or her job is up to each member of the team.

Working in steps toward a model of gathering insight in expertise was the main target of this case study. But at the same time it was discovered incrementally, that it is not easy to download the experiences and expertise from people for the benefit of all.

In the end the real question proved to be: "Who is going to serve as the maintenance agent at the weekend?" So, serving the targets of the company to have fully trained and highly expertise people to run a satellite station did not fit with the family intentions to spend the weekend outside the satellite station.

Knowledge management is not just a matter of finding expertise and allocating people on the basis of this. Work is also a culture, and free time is part of human life. Not analysing this potential conflict, lead to a naïve procedure for detecting skills. So, it is communication between people, managers and employees that count.

Case 2: Designing a Knowledge Bank for Knowledge Dissemination

The ING bank in which this study took place, is a merger of three former institutions: the Postbank, the NMBank (specialised in Small and Medium Enterprise Financing) and National Nederlanden (NN), an international insurance company. The cultures and tasks of these three institutions are quite different. The mergers are meant to grow and to maximise new opportunities as a consequence of co-operation.

All the institutions did have an HRD department, but these were brought together in one department for the whole company. HRD is part of HRM. Every branch, however, can preserve their own educational division for standard training. The HRD department has to build up a new image of customised training and advice, in stead of being the provider of standard courses.

In order to be a customer driven organisation, as well as a good interface between the different training departments, the HRD manager takes the decision to design and test a tool for saving expertise and to raise the accessibility of information for all by designing a knowledge bank. In using the System Approach Model of Kaufman (1979) there is some feeling that a workable knowledge bank might be the output. The Kaufman model consists of five steps:

- identify the problem
- determine solutions and alternatives
- select the best strategy
- implement the solution
- evaluate the effect

Based on information models, prototyping principles and reasoning processes not so much the needs of the employees were taken as the guiding principles, but essential organisational activities, functions and objects (Visscher, 1994; Sogtoen, 1996). In the process of prototyping an information bank, however, the user can be interactive and evaluative and have impact in the evolution of the knowledge bank. How meaningful this point of view might be the communication strategies and policies of HRM and HRD did not allow passing by the needs of the clients. Employees therefor had to be interviewed about their activities and computer needs. On the basis of this information a design of a knowledge bank should be made even when the analysis of existing systems of knowledge exchange in different organisations can help to a better understanding of the use and functionality of these concepts. The consequence of this is that a survey should be organised for all HRD professionals (n=59) to let them express their needs in relation to a knowledge bank

Results[1]

The questionnaire was set up to find information about the needs of HRD professionals in knowledge management by using a knowledge bank. Based on this questionnaire 39 responses were collected (66%) of the HRD professionals. On the basis of the response it was found that carrying out training is the most frequent and most important activity, as well as organising meetings, developing course materials, interface management, counselling, and policy studies. Undertaking evaluation research and self study (reading of professional literature) and coaching and guiding of trainees do not score highly.

Respondents agree that the proposed knowledge bank could help to *organise the information* chain in the organisation. Having an overview of all the available course material in all departments of the company could help to prevent reinventing the wheel. Such a knowledge bank could also help *to generate new ideas about course design*, tools, tips, and tricks, as well as good teaching examples.

For counselling and giving advice to employees for example about *job rotation, career planning*, the knowledge bank can also play an important role. Keeping people up to date on the training market was not identified as a special need.

In general, HRD professionals asked for a knowledge bank for direct problem solving for training professionals; that is offering and developing training.

Tabulating four functions could indicate the functionality of the bank; printing, searching people, mailbox, and communication tools. Printing seems to be most important. Also having a mailbox, which can be used for remarks, questions tips. Other functions like communication and searches were not perceived as essential, for the time being.

The conclusion is that the knowledge bank as a prototype needs to address questions and problems related to advice, information, and developing course materials.

All kinds of technical questions can be raised about the functionality and accessibility of the proposed bank. Important are the reliability of data and the validity of information. For the understanding of this case here it is enough to know that these conditions have to be tested. (See Sogtoen, 1996) in using a reference strategy.

---

[1] For an exhaustive description of the methodology of the study see K. Sogtoen (1995). Op weg naar kennismanagement. Enschede: Universiteit Twente (doctoraal studie toegepaste onderwijskunde).

The Reference Strategy

This strategy is used to find other systems with the same targets in the Netherlands. Different systems do exist, externally and internally in companies. Four systems are compared and tested, especially to see whether the searching strategies are efficient and practical. (Sogtoen, 1996, p. 74-75). One of the systems has been chosen as a tool, based on its functionality for searching, the type of interfaces and connections, browsing information, printing options, password protection, operating system, costs, and experience with the system.

The last step was to codify all the educational and training material of the three institutions for incorporating into the knowledge system.

Effects?

Does a knowledge bank work and does it help to disseminate and exchange information? After a pilot test to see whether the bank can be used for a field-test, the following results came out: The user did not have time to test the system on the job, for which it was designed! From a response group of 106 only 15 HRD professionals reflected. Even this group felt down to about 8 people telling almost nothing. In a discussion after the test the following perceptions and conclusions emerged:

- looking for information is a time consuming process, often connected to serendipity
- there is a strong need for an overview of all the course materials within the company; not every professional is willing to put his/her course materials in the bank;
- there is a need to have an overview of experts in the company, to contact them, call them and have their advice;
- there is a need for the course offerings of a select set of external training providers; these are not in the system yet;
- protecting the copyrights of designers is important;
- the need for one standard is not apparent; every division has its own needs that have to be covered.

Knowledge Management and Dissemination: Some Conclusions

Knowledge and expertise are important tools in organisations today. Not only people carry knowledge. Knowledge can be stored in different forms and formats. But people want to be informed, will transform information into knowledge and will communicate this knowledge for the sake of themselves, the processes they serve, and the company. But identity and copyrights must be protected, information must be valid, and norms an values of people and organisations must also be protected.

Organisational climates and cultures could hinder the exchange of information and the quality of communication. Both cases show that searching for solutions and designing tools is not an easy path. It is a kind of learning to understand processes, people and their motives, and to break down barriers in communication structures. If we take the four processes of Nonaka as key strategies toward an information and learning society, then we might tentatively conclude on the basis of these two case studies, that we are on the tip of the iceberg of tacit knowledge. We need a better understanding of social and power structures. It is not so much the design of high tech systems, but the realisation and implementation of high touch systems in which people trust to share and disseminate expertise. We need informal places like coffee corners and social places to communicate and to learn to open social structures. Internalisation and institutionalisation of explicit knowledge will go on, just to keep us going in a world of routine and standards.

It may be that Electronic Performance Support Systems (EPSS) and the informal way of using virtual learning environments, can help us, to overcome prejudice, power and pride, because of a lost weekend or a misguided feeling of secret genius training solutions.

A Theory of Knowledge Management

Richard J. Torraco
University of Nebraska

Knowledge is now recognized as an organization's most valuable asset. Leading organizations have developed systems to leverage the value of knowledge to meet their objectives. Because knowledge is a complex and intangible asset that cannot be managed like other resources, organizations that do not systematically examine the cultural and technical dimensions of knowledge management experience difficulties with this task. These organizations develop information systems that are not grounded in a sound conceptual framework, in part, because they have no framework for knowledge management. This paper develops such a framework using Dubin's methodology for theory building. Drawing on existing theory and recent empirical studies of this issue, a theory of knowledge management is developed. Implications for further study of this issue are proposed.

Keywords: Knowledge Management, Theory Building, Intellectual Capital

A theory that purports to advance the understanding of how knowledge is managed in organizations must draw from a broad theoretical base because the phenomenon the theory attempts to explain, knowledge management, is itself a pervasive concept that effects every aspect of how an organization functions. Knowledge management deals with knowledge as a vital, yet intangible asset that warrants at least the level of attention given to other valuable resources. Organizations cannot afford to take a passive stance toward knowledge management in the hopes that people are acquiring and using knowledge, and that sources of knowledge are known and accessed throughout the organization. Instead, the theoretical and empirical work cited here support a bold, proactive strategy for developing and managing knowledge. Organizations seeking to sustain competitive advantage have moved quickly to develop systems to leverage the value of knowledge for this purpose (Robinson and Stern, 1997; Stewart, 1997).

Four theoretical traditions provide the basis of this paper—human capital theory, the nature of expertise, organizational learning, and knowledge management. Each of these areas brings an important element to the task of advancing our understanding of knowledge management. These four theoretical foundations are reviewed next.

Human capital theory. Human capital theory is a branch of economics. Economics addresses the allocation of scarce resources among a variety of human wants. Economics represents human wants and the scarcity of resources as essential and perennial elements in the study of any human activity. As with the social sciences in general, economics is not an exact science and predictions of economic developments are subject to error. According to Lewis (1977), however, economics is the social science "with the most sophisticated body of theory—that is, the one with the greatest predictability accuracy of all the social sciences" (p. 43).

Human capital theory is considered the branch of economics most applicable to education and human resource development. While Theodore Schultz' (1961) address to the American Economic Association was the first presentation of research on the return-on-investment in human capital, Gary S. Becker is generally credited as the leading developer of human capital theory. Classical economic theory considers labor as a commodity that can be bought and sold. Because of the negative connotations associated with the exploitation of labor by capital, it is understandable that human capital theory is still suspect in some circles. However, unlike the meaning traditionally associated with the term "labor," human capital refers to the knowledge, expertise and skill one accumulates through education and training. Emphasizing the social and economic importance of human capital theory, Becker (1993) quotes the economist Alfred Marshall's dictum that, "the most valuable of all capital is that invested in human beings" (p. 27). Becker considers education and training to be the most important investments in human capital.

The nature of expertise. Despite over thirty years of research, the question, "what is expertise?" has not been satisfactorily answered. Seminal works have identified seven key characteristics of expert performance (Chi, Glaser & Farr, 1988), methodological approaches to the study of expertise (Ericcson & Smith, 1991), the process through which expertise is developed (Anderson, 1982), the characteristics that distinguish the expert from the experienced non-expert (Bereiter & Scardamalia, 1993), and taxonomies of performance domains (Holton, 1999). Although the fields of education, information systems, and knowledge engineering have contributed to the present understanding of expertise, the majority of research on this topic has been done in cognitive psychology and the cognitive sciences (Kuchinke, 1997).

Copyright © 1999 Richard J. Torraco

While much remains to be learned about the nature of expertise, Herling (1997) proposed an operational definition of expertise synthesized from this research. His definition is based on three foundational concepts: (1) expertise is a dynamic state, (2) expertise is domain-specific, and (3) expertise is composed of knowledge, experience and problem-solving. Herling defined expertise as "the ability of the individual to consistently do the right things in the right way." Although inconclusive, current thinking on the nature of expertise provides a basis for classifying and representing different types of knowledge.

Organizational learning. Research on organizational learning has emphasized the importance of adopting a holistic, systemic approach to creating a work environment that cultivates the learner, learning processes, and a learning infrastructure. Catalyzed by the immensely popular work of Senge (1990), recent research has identified strategies for the transformation to a learning organization (Watkins & Marsick, 1993), models of organizational learning (Schwandt, 1995), models and instruments to assess team learning (Dechant, Marsick & Kasl, 1993), learning organization implementation reports (Bierema, 1997), and learning organization assessment instruments (Redding, 1997).

Organizational learning research has not yet integrated recent thinking about the role of knowledge management in organizational learning. As learning is viewed as the catalyst for developing personal and organizational capabilities, and as knowledge management can facilitate organizational learning, it seems reasonable that these two streams of research could be integrated. However, organizational learning has not emphasized structured knowledge and the use of information technology to capture and leverage knowledge (Davenport & Prusak, 1998). Some feel that the organizational learning approach deals with knowledge in too abstract and conceptual a fashion for it to have a meaningful effect on how organizations achieve their objectives (Grant, 1996; Stewart, 1997).

Knowledge management. Knowledge management has been defined as the process of creating, capturing, and using knowledge to enhance organizational performance (Bassi, 1997). Knowledge management is most frequently associated with documenting and codifying individuals' knowledge and then disseminating it through such venues as a company-wide database. Knowledge management also includes activities that facilitate human exchanges through traditional methods such as conversations and written documents. The idea that knowledge, like physical resources, is an asset worthy of investment has roots in human capital theory. But only recently have methods been developed for sharing knowledge that are sensitive to its unique properties.

Knowledge was first proposed as the primary form of capital by Milan Zeleny (1989). He argued for a reversal of the trend toward the continuing specialization of knowledge in favor of more integrative and multifunctional systems of knowledge management. Using a similar argument for knowledge integration, Stewart (1997) advised managers to focus more on what they know, that is, their intellectual capital, than what they own. To support this reorientation, he provided a comprehensive set of tools for measuring and managing intellectual capital.

Three seminal works have brought knowledge management to the forefront of organizational research: Nonaka and Takeuchi's (1995) groundbreaking study of knowledge generation and use by Japanese companies; Leonard-Barton's (1995) detailed description of how leading manufacturing companies capitalize on their knowledge; and Davenport and Prusak's (1998) comprehensive examination of the challenges and opportunities of knowledge management. These works provide a realistic assessment of the cultural and technical requirements of developing a knowledge management system in today's competitive, resource-constrained business environment.

The Need for a Theory of Knowledge Management

This section presents three brief arguments for the need for a theory of knowledge management. Each argument is based on Campbell's (1990) synthesis of the roles of theory.

Defining applied problems. Theory provides a means for identifying and defining applied problems. Organizations pursuing knowledge management often look for the best way to use information technology for this purpose. Knowledge management quickly becomes a solution (that is, information technology) in search of a problem. Yet organizational theory tells is that successful initiatives must first be rooted in the pursuit of organizational goals. Meeting customer requirements or key business needs are core purposes for which knowledge management should be undertaken. When appropriate, information technology serves as a primary means for knowledge dissemination. Theory helps us relate means to goals.

Evaluating solutions. Theory provides a means for prescribing or evaluating solutions to applied problems. If knowledge management is seen as a way to more effectively achieve business goals, then the success of a knowledge management project is often defined by how quickly and how well the business goals were achieved. However, theory tells us that organizational performance outcomes are determined by multiple factors,

including the knowledge of employees. The relative contributions of these factors cannot be directly inferred from success in achieving the outcome. Conversely, when organizational goals are achieved this cannot be considered a direct consequence of knowledge management. Performance outcomes may be achieved despite marginal contributions from knowledge management. On the other hand, a knowledge management project may be quite successful despite the failure to achieve organizational outcomes.

Responding to new problems. Theory provides a means for responding to new problems that have no previously identified solutions strategy. With few precedents from which to learn, organizations implementing a system-wide project to codify and disseminate knowledge face a daunting task. Yet theory has identified the key cultural and technical variables that are critical to successful system-wide change. These include a clearly articulated, overarching purpose for knowledge management, top management commitment to this effort, flexibility that allows the knowledge management system to adapt to changing methods and needs, and a change philosophy that values continuous learning and improvement. Thus, theory provides the basis for responding to novel problems.

In short, a theory is needed to keep knowledge management aligned with the business goals it is supposed to serve. A theory of knowledge management helps identify criteria against which project success can be evaluated, even when organizational success is elusive. A theory of knowledge management also provides a means for responding to new, seemingly overwhelming, challenges in managing knowledge that, because they are new, have no previously identified solution strategies.

Dubin's Methodology for Theory Building

Dubin (1978) provides a comprehensive methodology for theory building that is particularly relevant for applied fields such as education and management. More so than other theory building strategies, Dubin's eight-phase methodology for theory building lays out an explicit roadmap for the theorist to follow. The methodology offered by Dubin, a well-known writer on theory and theory building, is frequently used as a template for building theories in the behavioral sciences. The eight phases of theory building are: (1) units (i.e., concepts) of the theory, (2) laws of interaction (among the concepts), (3) boundaries of the theory (the boundaries within which the theory is expected to apply), (4) system states of the theory (conditions under which the theory is operative), (5) propositions of the theory (logical deductions about the theory in operation), (6) empirical indicators (empirical measures used to make the propositions testable), (7) hypotheses (statements about the predicted values and relationships among the units), and (8) research (the empirical test of the predicted values and relationships). The first five phases of the methodology represent the theory building component of Dubin's model, and the last three phases represent the process of taking the theory into real world contexts to conduct empirical research. Although theorists must consider the entire scope of Dubin's model for effective theory building, theory building and empirical research are often separated, and each of these is conducted as a distinct research effort.

A Theory of Knowledge Management

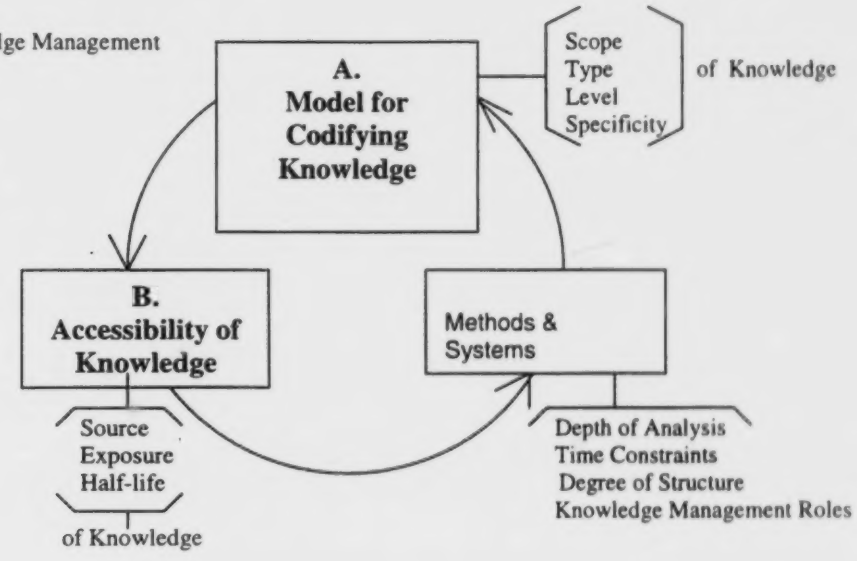
This section describes the development of the theory using the first five phases of Dubin's methodology for theory building.

Units of the theory. The units of the theory are the concepts, the building blocks, from which the theory is constructed. There are three basic units of the theory of knowledge management—a model for codifying knowledge, the accessibility of knowledge, and methods and systems for knowledge management. Each of these three units of the theory has several conceptual dimensions of its own that are described in the following sections. A model that represents the three units of the theory and the dimensions of each unit appears in Figure 1.

Model for Codifying Knowledge. Rather than attempt to describe what knowledge is, a task that has long intrigued the world's greatest thinkers and that is not yet resolved, a model for codifying knowledge is provided. This model facilitates decision making about what knowledge to share and how it should be shared. Accepting the lack of consensus on what knowledge is, the model reflects the simple tautology offered by Grant (1996) that knowledge is "what is known," and that there are many types of knowledge relevant to organizations. The model also emphasizes the role of the individual in creating knowledge that is consistent with Simon's observation that "all learning takes place inside individual human heads; an organization learns in only two ways: (a) by the learning of its members, or (b) by ingesting new members who have knowledge the organization didn't previously have" (1991, p. 125). The model described here is for codifying individual knowledge. The organization also supports individual knowledge creation and the sharing of knowledge among members. The role of the organization in

knowledge management includes establishing a climate of trust and support for sharing knowledge, developing the infrastructure for sharing knowledge, and other knowledge management roles discussed later in the paper.

Figure 1.
A Model of Knowledge Management



The model for codifying knowledge, adapted from Microsoft's "SPUD" system for profiling employees' knowledge (Cusumano and Selby, 1995), has four dimensions: (a) scope of knowledge, (b) type of knowledge, (c) level of knowledge, and (d) specificity of knowledge. (See Figure 1., A Model of Knowledge Management). The scope of knowledge is a four-tiered structure that addresses the range of an individual's knowledge. At the bottom level is foundational knowledge that is exemplified by entry-level competencies. The next level is knowledge that is unique to a particular job or role. An information systems analyst, for example, needs programming skills to diagnose problems in the system's operating codes. Next, knowledge can be functional in scope, a level that applies to all employees in a particular function or department. All employees in the accounting and finance area would be knowledgeable in financial analysis; every human resource professional would have expertise in matching employee performance with reward systems. At the top of the scope of knowledge structure is knowledge that is organization/industry in scope. This includes knowledge of the overall business the organization is in, the organization's strengths and weaknesses, the markets it serves, and the factors critical to the organization's success.

Within each of the four tiers of the scope of knowledge are two types of knowledge—explicit knowledge and tacit knowledge. Explicit knowledge is demonstrated through expertise in the use of specific tools and methods. Winter's (1987) taxonomic dimensions of knowledge distinguish explicit knowledge—knowledge that is articulable, observable in use, and independent of a broader system of knowledge, from tacit knowledge—that which is not articulated or observable in use. Winter cites Polanyi's classic observation about tacit knowledge that "*the aim of a skillful performance is achieved by the observance of a set of rules which are not known as such to the person following them*" (1962, p. 49, italics in original). "Not known as such" here means that the performer could not provide a useful explanation of the rules he/she followed to execute the performance. Thus, tacit knowledge, while available to the performer, is present at a deeper, unconscious level that cannot be articulated to others.

Within each type of knowledge there are also four levels of knowledge: (a) basic, (b) working, (c) leadership, and (d) expert. For a given type of knowledge, these levels can be specified in several statements that make the level clear and measurable. A person's level of knowledge can be rated by managers, peers, customers and others who are in a position to provide informed judgements about the person's level of expertise. Finally, the specificity of knowledge is an acknowledgement that an individual's knowledge can be from a specific domain or from multiple domains. For example, a high school principal has knowledge of theories of learning. This is knowledge drawn from a single domain. The principal is also knowledgeable about how to foster a high school environment conducive to learning through the use of resources and incentives for teachers. This knowledge is drawn from multiple domains including learning theory, performance management, and organizational change.

Accessibility of knowledge. The accessibility of knowledge is the degree to which knowledge is available to be shared throughout the system. The three dimensions of this unit of the theory are: (a) the source of knowledge, (b) the half-life of knowledge, and (c) the exposure of knowledge. (See Figure 1., A Model of Knowledge Management). The accessibility of knowledge is enhanced if the knowledge is consolidated and can be obtained from a single source of knowledge. Knowledge from a single, focused source is contrasted with knowledge that resides in several sources. Knowledge that is diffused among sources, especially sources of different types (for example, people, paper documents, and electronic media) is less accessible than knowledge from a single, focused source.

The half-life of knowledge is the time interval during which 50% of the knowledge will become obsolete and replaced by new knowledge. The novelty of new knowledge gives it visibility that, in the short-term at least, enhances access to this knowledge. Older knowledge, on the other hand, has the potential for a longer half-life by virtue of its age alone, but it must endure a longer period of scrutiny from emergent new ideas.

The exposure of knowledge is the degree to which knowledge is based on rules that are evident to the observer. Procedural knowledge can be directly inferred from the behavior of the performer (Bereiter and Scardamalia, 1993). This knowledge is easily represented by the observer from the sequence or manner of actions taken by the performer. This knowledge is more "exposed" to the observer than knowledge that is intuitive or conceptual in nature. Because conceptual knowledge is present at a deeper level, it is less exposed to observation. This is the "tacit knowledge" of Polanyi (1962).

Methods and systems for knowledge management. These are the strategies and techniques used to identify the knowledge and make it explicit and available to others. The four dimensions of this unit of the theory are (a) the depth of analysis, (b) the time constraints on managing knowledge, (c) the degree of structure in the methods/systems, and (d) the knowledge management roles. (See Figure 1., A Model of Knowledge Management).

The depth of analysis addresses the extent to which the knowledge management system makes the knowledge explicit to others. Detailed descriptions of one's working knowledge are communicated verbally in the stories and case examples people tell about their work, or in written form through research reports and other documents. On the other hand, a knowledge management system may simply identify the source of knowledge (for example, a person or document containing the knowledge) so that others can consult it directly. Knowledge mapping simply locates important knowledge in the organization and publishes this information in some kind of map or directory. The main benefit of knowledge mapping is in showing people where to go when they need expertise. Thus, the knowledge management system may present a detailed description of the knowledge itself (for example, presenting an on-line database or direct access to technical report) or direct the user to the source of knowledge using knowledge mapping. The depth of analysis, which is conceptually distinct from the depth of knowledge, is the extent to which the system makes the knowledge explicit.

The time constraints for finding solutions also determine the methods and systems used for knowledge management. Many circumstances allow time for search, reflection, and synthesis of knowledge. Others situations, particularly those involving customer service in which the customer needs assistance right away, require real-time performance. Methods conducive to rapid search and retrieval of knowledge are used in "help desk" applications that allow users to input data to classify the customer's problem and find a match between the problem and a solution selected from among pre-determined alternatives. This real-time system delivers domain-specific knowledge through case-based reasoning (CBR) technology (Kolodner, 1993). In situations not as constrained by time, methods for verbal or electronic exchange of knowledge (for example, e-mail or Lotus Notes) are more desirable.

The degree of structure of the methods and systems for knowledge management distinguishes between the methods best suited for archiving quantitative, structured knowledge and those best used for qualitative, unstructured knowledge. Structured content such as data on customers, products, prices, and specifications for service, warranty, and delivery fit well within relational database programs that give users desktop access. A database format allows information to be organized in several ways (for example, by customer or by product) with all the relevant data linked together. On the other hand, unstructured content such as the stories and experiences of experts, are best represented in web pages, Lotus Notes, and intranet technology, which allow users to shape their own narratives. Using a combination of structured and unstructured methods provides the flexibility to accommodate a broad range of knowledge, and prevents amorphous, tacit knowledge from being destroyed by being forced into rigid structures (Davenport and Prusak, 1998). The degree of structure in the knowledge management system is determined by the types of knowledge to be represented. This relationship is addressed in the next section by the theory's "laws of interaction."

Finally, knowledge management roles are necessary to initiate and manage the methods and systems for capturing and disseminating knowledge. Because knowledge resides in employees, it should be evident that all

employees, not just those charged with developing a knowledge management system, are responsible for sustaining the activities of knowledge management. While successful projects require people dedicated full-time to maintaining a dynamic knowledge management system, ultimately, the managers and workers who perform the organization's work (designing products, marketing, selling, managing resources) bear the responsibility for carrying out the day-to-day activities for managing knowledge. These people must be willing to share their knowledge and make use of the knowledge of others.

Laws of interaction. The relationships among the concepts (units) of a theory are described in the theory's laws of interaction (Dubin, 1978). The laws of interaction show how changes in one or more units of the theory influence the remaining units. Four laws of interaction govern the relationships among the units of the theory.

Especially for knowledge workers, knowledge rarely fits neatly into a single category of the "model for codifying knowledge." Despite our present inability to precisely describe and classify knowledge, organizations seek to capitalize on knowledge management to enhance innovation and learning. Thus, knowledge is both important and elusive. This dilemma is the basis for the theory's first law of interaction.

1. *All knowledge is unique and can be described in distinctive ways. A variety of methods exist for describing different types of knowledge. Systems for knowledge management must be founded on descriptions of knowledge using a model for codifying knowledge. (Therefore, the theoretical system represented in Figure 1., A Model of Knowledge Management, begins at box A and proceeds counter-clockwise around the model).*

For example, suppose an engineering manager assigns a small design project to a staff engineer. Although the staff engineer has produced similar designs in the past, the engineer needs data from recent technical reports to handle this design application. This means that some of the knowledge for this project resides in the engineer and some of the knowledge must be taken from recent publications. These are the primary sources of knowledge that determine its accessibility. To organize and standardize their work, engineers in this department have adopted a generic problem-solving model adapted to solving design problems. While some of their problem solving is rules-based and observable to others (for example, the diagram of a design problem and a list of alternative solutions), much of the engineers' knowledge is conceptual and not observable to others. These factors contribute to the degree of exposure of knowledge. Furthermore, the design project requires bringing together technology that has long been the industry standard with state-of-the-art engineering knowledge that has never been used in this application. These requirements define the half-life of knowledge for this project.

The type of knowledge needed by the staff engineer is described using the "model for codifying knowledge." The type of knowledge (that is, job/role in scope, domain-specific, both tacit and explicit) is needed to determine how accessible the knowledge is. This feature of knowledge is the basis for the theory's second law of interaction.

2. *The type of knowledge determines the accessibility of knowledge. (This is the relationship between box A and box B in Figure 1.). The accessibility of knowledge must be assessed before adopting the methods and systems that are most appropriate for knowledge management.*

The accessibility of knowledge determines what methods are used to make the knowledge available to others. Some of the knowledge used in the engineering example is non-observable (the engineering manager knowing which subordinate should be assigned the design project) and conceptual (the staff engineer's conception of how the new design project compares with past projects). This knowledge is not readily accessible to others. It is best shared through knowledge mapping and unstructured methods for knowledge exchange. Other types of knowledge, such as the procedure for making engineering assignments and the generic problem-solving method used by engineers, are rules-based and easier to communicate through structured methods, such as written procedures and models. This relationship between the accessibility of knowledge and the ways in which it is made available to others is the basis for the theory's third law of interaction.

3. *The accessibility of knowledge determines the choice of methods and systems for knowledge management. (This is the relationship between box B and box C in Figure 1.).*

All dimensions of a unit of the theory are considered together when determining how one unit relates to another unit of the theory. That is, we cannot take a single dimension of a unit and attempt to relate this dimension alone to another unit of the theory. For example, we may want to know how an organization's facilities are secured at the end of the day. A security guard may provide us with a list of security procedures, some of which require the guard to physically inspect and lock certain areas, and others involve electronic measures, such as setting the security alarm. Based on the exposure of knowledge alone, this would appear to be procedural knowledge, most of which can be observed. This knowledge is best captured with structured methods (for example, a list of sequential procedures written by the security guard).

However, the source of knowledge may not be limited to the security guard. Weekend security of the facility may be the responsibility of a security contractor or the police department, who may have different security procedures. Thus, the accessibility of knowledge is not simply a function of the security guard's procedures, a type

of rules-based knowledge that is easily exposed. The choice of method for sharing this knowledge must also take the multiple sources of knowledge into consideration. The need to consider all the dimensions of a unit of the theory is the basis for the theory's fourth law of interaction.

4. *The relationship of one unit of the theory to another unit is based on a composite assessment of the unit. The unit as a whole, not a single dimension, is considered with respect to how the unit relates to other units of the theory. (This law of interaction applies to all three units of the theory in Figure 1.).*

Boundaries. Dubin (1978) describes the boundaries of a theory as defining the domain over which the theory is expected to apply. The boundaries of a theory establish those aspects of the world the theory is modeling by distinguishing the theoretical domain from other aspects of the world not addressed by the theory.

The domain within which the theory is expected to hold is the domain of work. The distinction between work and all human activities separates the domain of the theory from non-work human activities not addressed by the theory. Within the domain of work, the theory applies to knowledge management. Because the theory addresses knowledge management performed in any organization that accomplishes work, there are no external boundaries specified for the environment. The theory applies to knowledge management regardless of the contextual factors of person, organization, time, or purpose.

System states. Dubin (1978) defines a system state as being a condition of the system being modeled in which all the units of the system take on characteristic values that have persistence through time, regardless of the length of the time interval. All units of the system have values that are determinant, that is, that are measurable and distinctive for that state of the system. A system state that accurately represents a condition of the system being modeled has three characteristics: (a) inclusiveness (all the units of the system—a model for codifying knowledge, the accessibility of knowledge, and methods and systems for knowledge management—are included in the system state), (b) persistence (the relationship between knowledge and method persists long enough to allow the goodness of fit between them to be determined), and (c) distinctiveness (all units take on unique values for that system state).

Propositions. Propositions of the theory are logical deductions about the theory in operation. Propositions of a theory are true because they are statements that are logically derived from the theory (Dubin, 1978). Propositions can then be subjected to empirical testing. Five propositions from the theory are specified next.

1. Leaders must identify the business goals to be served by a knowledge management project. A system for codifying and disseminating knowledge will not be sustained unless it is anchored in important business needs.
2. The importance of knowledge determines whether or not it should be included in the knowledge management project. The type of knowledge determines how it should be codified and disseminated. These are conceptually distinct issues that should be determined in this sequence.
3. Knowledge should be standardized (i.e., modified by substituting common terminology) and edited for just enough uniformity to allow the knowledge management system to work. The distinctive character of local knowledge must be preserved while making the knowledge available for widespread dissemination.
4. An optimal match can be achieved between the type of knowledge and the methods used to make it explicit. This is a matter of achieving fit between the knowledge, its accessibility, and the systems for sharing it.
5. The system for knowledge management is developed in such a way that it can change as rapidly and flexibly as the knowledge itself.

Implications for Future Research

Future research is needed to assess the theory in the real world through empirical research. The last three phases of Dubin's methodology are used to conduct empirical research. For this the researcher specifies empirical indicators to make the propositions testable, states hypotheses about the predicted values and relationships among the units of the theory, and conducts research to empirically test the predicted values and relationships. In short, the theory of knowledge management needs to be tested through empirical research.

Future research is also needed to assess the domain over which the theory rightfully applies. The concepts (units of the theory) from which the theory was developed are drawn heavily from private-sector and corporate models of organizations. The terms business, industry, product, customer, marketplace, and other private-sector concepts appear throughout this paper. The theory proposes that a knowledge management system draws its purpose from meeting a business need. What about community, government, non-profit and other non private-sector organizations whose mission and performance are assessed differently than those of private-sector organizations? Does the theory of knowledge management apply in these contexts as well? Testing the theory in non private-sector settings is needed to identify the domains over which the theory applies and does not apply. If the theory does not explain knowledge management relationships in non-profit settings, then it may be modified to do

so. Otherwise, its scope and boundaries should be altered to reflect its exclusive application to private-sector organizations. In short, research is needed to assess the relevance and applicability of the theory.

Signposts on the Road to Knowledge Management

Allison Rossett
James Marshall
San Diego State University

Knowledge management (KM) is what an organization does to take its intellectual resources, both obvious and subtle, and make them fresh, meaningful, and accessible. What is KM and why is it important to HR professionals? What is the status of KM in organizations and HR and training units? Are consulting firms leading the way? These questions were investigated in this paper.

Keywords: Knowledge Management, Human Resource Profession, Performance Consulting

Knowledge Management (KM) involves recognizing, documenting, and distributing the explicit and tacit knowledge resident in an organization's workforce and customers. The mission is to provide the right information to the right people at the right time (Stewart, 1997c; Davenport & Prusak, 1998; O'Dell & Grayson, 1998). As good an idea as it is, knowledge management is far from guaranteed. To bring it about, both individuals and organizations are pressed to engage in new ways of thinking and acting (Davenport & Prusak, 1998; Agor, 1997; Stewart, 1997c). Knowledge management relies upon executive sponsorship, organizational policies, targeted technologies and individual and cross-functional generosity and energy. Bringing system and certainty to KM calls upon human resources professionals to engage in initiatives akin to the strategic directions encouraged by Ulrich (1997), Wognum (1998), and Rossett (1999). Are human resources and training professionals ready? What roles are these professionals now playing as regards KM? This preliminary study sought their views about KM in their units and larger organizations.

The Focus on Knowledge Management

Evidence of the contemporary interest in knowledge management is plentiful. In 1996 alone, there were at least six major conferences focusing on the subject. In the last three years, three journals dedicated to knowledge-related topics have emerged. A web site, www.brintcom, has grown like topsy. Knowledge management is beginning to happen:

- The World Bank identifies knowledge management as an "urgent necessity" for global development, and is spearheading knowledge-management initiatives in Third World countries (Lakewood Publications, 1998).
- Andersen Consulting has leveraged the knowledge of their worldwide workforce through its Knowledge Xchange system, a Lotus Notes-based system that allows storage of software code that can be re-purposed, templates for reports or budgets, summaries of literature read by consultants and relevant to the industry, employee profiles, and anecdotal experiences with challenges and customers. At the moment of need, wherever and whenever, Andersen employees can access people, examples, presentations, and data (Stewart, 1997c).
- Chevron Corporation sets up Best Practice Teams throughout the corporation. The team that shares knowledge related to energy-use management saved Chevron $150 million on its annual power and fuel bill (Martinez, 1998; O'Dell & Grayson, 1998).

Moving to Knowledge Management

While some are engaged in KM efforts, initiating KM in an organization is a challenge. Research conducted by The American Productivity & Quality Center (APQC) revealed that specific successful practices would typically linger in a company for years, unrecognized and unshared. However, even when recognized, it took over two years on average before other sites within a company began to actively adopt the practice, if at all (Szulanski, 1995).

The nature of knowledge is one reason it is difficult to move an organization to KM. Consider knowledge as "a fluid mix of framed experience, values, contextual information, and expert insight" (Davenport & Prusak, 1998 p. 5). Allee (1997) further notes that knowledge is "messy."

Copyright © 1999 Allison Rossett and James Marshall

While the meaning of knowledge is at the heart of the challenge, there is little the human resources professional can do about definition. Thus we have chosen to look at five other influential levers which are, though formidable, more within the ken of human resources and training professionals: culture and policies; access to information; technologies; knowledge management as priority; and learning about KM.

Organizational Culture and Policies

Davenport and Prusak (1998) describe the first step in any knowledge initiative as recognizing there are markets for knowledge. This involves an attempt to propel employees to want to put their 'knowledge products' on the shelves. Some employees will feel they are being asked to give away for free that which they have come to perceive as their own valuable possession or that which distinguishes them and provides job security.

Thomas Stewart (1997b) poses a question that gets at the ripeness of the culture for KM: "When you return from a convention, which do write up first, your expense account or your trip report? Which contains more creative thinking? Which is read more attentively" (p. 160)?

Access to Information

According to Stewart (1997c), it is critical to "connect people to data, experts, and expertise" when they perceive a need (p.132). Hewlett Packard provides an example. HP has established a database comprised of HP Frequently Asked Questions (FAQs) databases. This enables employees to anticipate customer and employee concerns and repurpose and tailor responses.

Enabling Technologies

Technology is critical for KM, but not sufficient. Daveport and Prusak (1998) put it like this, "It's usually much harder to get organizational consensus for behavior change and new roles than it is for technology–and if you start with technology, the other necessary factors may never materialize"(p. 166).

Learning About KM

In a 1997 review of 70 knowledge management projects, the American Productivity and Quality Center (APQC) found that only two projects involved training staff or human resource managers regarding their roles in KM initiatives. Carla O'Dell, APQC President, states "To the extent that training implies classical job skills, you might expect it to be out of the loop. But to the extent that training is supposed to be part of team-building and change management, you'd think it should be very involved" (Stamps, 1997, p. 44).

Study Purpose and Methodology

Extracting, packaging, and distributing information is not new ground for human resource and training professionals (Rossett & Gautier-Downes, 1991; Gery, 1989; Hackos & Stevens, 1997). This preliminary study pursued the authors' curiosity regarding how far beyond job aids and documentation the profession has come, investigating the knowledge management practices reported by volunteer respondents. Based upon the five KM-influencing levers identified in the literature, we assessed readiness associated with knowledge management to tease out progress towards the systems and goals associated with KM. Additionally, we sought to understand the roles human resource and training professionals reported themselves to be playing in KM. Were they supporting larger knowledge-related initiatives and setting the pace through their own departmental practices? Were consulting firms leading the charge towards KM, as suggested by the literature?

Methodology

Instrumentation

A review of the literature identified key factors associated with the management of knowledge in organizations. These factors were transformed into a 44-question survey. The instrument included 29 questions focused on KM-related practices within the organization at large and 15 similar questions related to the respondent's unit. The majority of questions asked individuals to indicate the regularity of different KM practices and activities on a three-point Likert scale. We asked for ratings regarding items like: "Our people tend to generously share their ideas," and "Our people have systems to find the right person."

Sample and Data Collection Procedures

The survey was distributed to human resources, training and performance technology professionals who were voluntary attendees at a national conference featuring topics of interest to individuals in human resources and training occupations. An opportunistic sampling strategy was employed to collect responses from 122 individuals during March of 1998. The survey took about ten minutes to complete. The greatest participation was from individuals representing financial service/insurance (16%), manufacturing (16%) and consulting firms (13%). Thirty-three percent classified themselves as instructional designers, 30% as managers or executives, and 28% as performance technologists.

Data Analysis

A Cronbach alpha measure of reliability using SPSS was used to analyze the 26 3-point Likert scale questions associated with the organization at-large. Based upon the reliability analysis, two questions were eliminated, resulting in a scale of 24 questions with an alpha coefficient of .86. -tests were then conducted to determine differences between industry groups and the presence of a formal technology-based KM system. Differences between the organization at-large and the respondents' individual units were analyzed using paired *t*-tests.

The limitations of this preliminary study and analysis should be noted. In particular, an opportunistic sampling strategy was employed to obtain a small *n*. Additionally, the study is exploratory rather than hypothesis-based. Analysis to identify individual scales and increase reliability based on the five domains identified in the literature is being conducted for future reporting.

Results

Results of this study suggest that knowledge management is not yet pervasive in the view of respondents. There is, however, evidence of positive movement.

Formal KM Systems in Organizations

Eight percent of respondents admitted that knowledge was not captured in their organization. Sixty-nine percent worked for organizations that record *some* knowledge such as best practices or lessons learned. Of those reporting the capture of knowledge, 42% commit knowledge to a paper format and 27% to technology-based systems. Just 16% of the total sample worked for an organization where people "collaborate using a technology-based system that captures and provides access to knowledge."

Responses from individuals representing consulting firms mirrored published reports that these organizations are leading the way in knowledge management activities. According to these respondents, half of their firms use a technology-based system to capture and provide access to knowledge, compared to just 12% for the remainder of the sample.

Organizational Commitment and KM

To understand where organizations stand on the road to knowledge management, a mean was calculated for responses to 24 questions about KM-influencing practices in the respondents' organizations. This mean is based on a three-point scale, with 1=rarely, 2=occasionally, and 3=typically. The scale included questions related to customer-focus, knowledge sharing, organization culture, technology information systems, and learning activities and practices. The total sample realized a mean score of 1.98, suggesting that KM-related activities occur occasionally. Individual mean scores ranged from a low of 1.37 to a high of 2.65.

Items 13 and 14 asked respondents to report whether or not their organizations had people and technology devoted to capture, distribute and maintain knowledge systems. If organizations had such formal indicators as technology and staffing in place, does it correlate to other KM elements? The association with an extant KM system proved significant, with a mean of 2.12 for organizations with a KM system, versus 1.91 for those without (t=4.085, p=.000). Table 1 presents this analysis.

Table 1

Results of t Test using Organization Scale between Organizations With and Without Formal Knowledge Management Systems

Group	*Mean Score*	*t Value*	*2-tail Probability*
Organization KM Score			
With KM System *(n=55)*	2.12	4.085	.000
Without KM System *(n=65)*	1.91		

KM by Industry

Many real world examples of KM come from consulting firms, either in their internal efforts or in projects for their clients. Are they really further along the road on knowledge management than others? This question was initially supported by the fact that consulting firms were four times more likely to have a formal KM system comprised of staff and technology when compared to all other represented industries. A *t*-test for independent groups compared the mean organization KM score of the consulting firms to the remainder of the sample. Table 2presents the significant differences between the two groups, perhaps providing signposts for professionals who seek to nudge their organizations towards KM.

Table 2

Results of t Test between Consulting Firms and All Other Organizations

Group	*Mean Score*	*t Value*	*2-tail Probability*
Organization KM Score			
Consulting Firms *(n=16)*	2.30	-5.377	.000
All others *(n=106)*	1.93		

In what specific areas have consulting firms moved ahead? Table 3, a *t*-test for independent groups, provides the mean scores by item for the subset of questions with significant differences in responses between consulting and non-consulting groups.

HR Leadership in KM

While consulting firms are featured in the published KM literature, HR and training professionals have a much lower profile in those reports. We anticipated a leadership role, since many of the concepts associated with KM are familiar and congruent (Ulrich, 1997). Would HR and training units report more KM activities and initiatives in their home units than in the organization at large? A paired *t*-test was performed to compare individual unit practices to those of the organization. Table 4 presents differences between the two entities.

Discussion

Providing KM Leadership

Respondents believe they are more customer focused than the larger organizations in which they reside. They also credit themselves with finding resources and linking those resources to needs. In addition, they report themselves to be knowledge workers who generously share their ideas. While these attributes are laudable, they also reside in rather close proximity to typical human resource roles. Strong KM leadership will likely require human resource and training units to go beyond their conventional ken to forge new and flexible partnerships with MIS and customers.

Consulting Firms as Pioneers

As suspected, consulting firms are further along the KM path as evidenced by significantly higher ratings on questions about unrestricted access to information, supportive knowledge systems, and encouragement for communities of practice. Individuals from consulting firms are more likely to perceive themselves as knowledge workers and to point to incentives and reduced command and control management practices. Why? Perhaps it is the independent and even isolated status of some consultants who find themselves in Kuala Lumpur, Buenos Aires, or Boise, where each consultant depends upon ready access to ideas, examples and systems that increase the value they add to the customer.

Table 3

Results of Independent Samples t Test for Questions with Significant Differences Between Consulting Firms and All Other Organizations

Question	*Non-Consulting Firm Respondents (n=106)* Mean	*Consulting Firm Responses (n=16)* Mean	*t-value*	*significance*
Our people have a good sense of what a knowledge worker is.	1.71	2.44	t = -3.580	p = .000
Our people consider themselves knowledge workers.	1.91	2.75	t = -3.821	p = .000
Our people tend to generously share their ideas.	2.08	2.63	t = -3.081	p < .003
People in our organization are allied with their professions and communities of practice even more than with our company or organization.	1.76	2.33	t = -2.851	p < .005
Our people self-assess in order to get a fix on directions for growth.	1.73	2.33	t = -2.928	p < .004
Our people have systems to find the right person, obtain quick answers, weigh alternative approaches, and examine numerous examples.	1.70	2.63	t = -5.143	p = .000
Our managers and supervisors have shifted their command and control perspectives to better suit how knowledge workers approach their work.	1.68	2.44	t = -4.262	p = .000
When a manager seeks to reduce access to information, he or she must justify the restriction.	1.55	2.40	t = -3.775	p = .000
Our people are expected to spend time learning as much as they can about our customers.	1.94	2.60	t = -3.095	p < .002
Our customers can point to examples of how we use our knowledge of their needs to customize the products and services we create for them.	1.92	2.69	t = -3.768	p = .000
We actively educate our customers about our business.	2.25	2.75	t = -2.897	p < .004

Table 4

Results of the Paired t Tests Between KM-Related Organization and Unit Activities (n=122)

	Question	*Mean*	*t-value*	*significance*
Org	Our people consider themselves knowledge workers.	2.03	t = -6.397	p = .000
Unit	We consider ourselves knowledge workers.	2.54		
Org	We use both instructor-led classes and technology-based learning experiences as the primary means to develop the skills our people need.	2.41	t = -1.070	p < .287
Unit	We use both instructor-led classes and technology-based learning experiences as the primary means to develop the skills people in our organization need.	2.48		
Org	Our people tend to generously share their ideas.	2.15	t = -6.748	p = .000
Unit	We tend to generously share our ideas.	2.61		
Org	Technology in our organization is keeping up with our information needs.	2.00	t = -2.657	p < .009
Unit	Technology keeps up with our needs.	2.14		
Org	Our people have systems to find the right person, obtain quick answers, weigh alternative approaches, and examine numerous examples.	1.82	t = -6.082	p = .000
Unit	We can find the right person, obtain quick answers, weigh alternative approaches, and examine numerous examples.	2.28		
Org	Our people spend more time with our customers than with each other.	1.84	t = -2.756	p < .007
Unit	We spend more time with our unit's customers than with our own people.	2.09		
Org	Our customers can point to example of how we use our knowledge of their needs to customize the products and services we create for them.	2.15	t = -3.418	p < .001
Unit	Our unit's customers can point to examples of how we use our knowledge of their needs to customize the products and services we create for them.	2.37		
Org	We have long-term relationships and repeat business with our customers.	2.76	t = .780	p < .437
Unit	We have long-term relationships and repeat business with our unit's customers.	2.72		
Org	Customer feedback is captured and used to improve what we already do.	2.30	t = -1.364	p < .175
Unit	Customer feedback is captured and used to improve what we already do.	2.40		
Org	Customer feedback and needs are used to generate new initiatives.	2.28	t = -1.364	p < .175
Unit	Customer feedback and needs are used to generate new initiatives.	2.38		

Commitment Counts

Dabbling in KM is futile. The literature trumpets this point and it is supported by this study. When responses to KM technology and personnel allocation are combined to represent organizational commitment,

significant differences appear. The organizations that invest in both the people and the technology are the ones that are moving to KM.

A Long Row to Hoe

While sixty-nine percent of respondents report that they are capturing some knowledge, only sixteen percent report a collaborative technology-based system. An example of the need for improvement relates to an item about access to information. In most organizations the default is restricted access, an obvious barrier to KM. Another example is managerial command and control. Regardless of the importance the literature places on shared decision-making for knowledge workers, respondents in this study say it is not yet typical in their settings. A final example is provided by a large positive response to our query about information overload. The perception of overload is antithetical to a KM system, where meaningful structure and access is key.

Forward Steps

All is not gloomy. Consulting firms are defining the way, followed surprisingly closely by a small but significant utility company response. Overall, respondents report that individuals in their organizations are taking more responsibility for their own professional planning and development. They also acknowledge transition to instructor and technology delivered professional development, perhaps a tentative step towards a technology knowledge base, so much a part of any KM system.

With prior impetus from the quality and performance technology movements (Deming, 1993; Stolovich & Keeps, 1992; Rossett, 1999), these human resource and training professionals report a healthy customer focus. They go beyond paying attention and listening to an active quest for, and use of, customer feedback.

Conclusion

People who work with things or deliver non-professional services will have fallen from 83 percent of the working population in 1900 to 41 percent by the year 2000. Those who primarily work with information were 17 percent of the workforce in 1900, and will be 59 percent at the turn of the century (Stewart, 1997c, p.40). How will human resource professionals respond to this change? Will departments and professionals model the shift to KM? Or will MIS shape KM initiatives because technology is a blatant and critical element of the shift? This exploratory study suggests that while there are some reasons for optimism, much remains to be done.

The Relationship Between Human Resource Development and Business Strategy in 1998 Fortune 500 Companies

Erica D. Kalata
Tim L. Wentling,
University of Illinois at Urbana-Champaign

Human resource development (HRD) professionals are increasingly expected to align their activities with the business strategy of the organization. However, not all organizations have the same strategy or the same needs. The focus of this study was to determine if significant relationships exist between business strategy and HRD. The sample for this study was 52 1998 Fortune 500 companies. The results indicate that significant relationships do indeed exist between business strategy and HRD.

Keywords: Strategy, Human Resource Development and Strategy

Organizations that wish to attain or retain a competitive advantage in the increasingly changing global market must ensure that the focus of their human resource (HR) function is strategically aligned with their business strategy (Hamel & Prahalad, 1994). Nadler and Tushman (1992) state that strategy comprises the decisions that allocate scarce resources against the constraints and opportunities of a given environment, specifically choices of markets, offerings, technology, and distinctive competence. Business-level strategy is primarily focused on the question, "How are we going to compete?". The most prominent business strategy typology that has been studied and validated extensively (Bird & Beechler, 1995; McDaniel & Kolari, 1987; Shortell & Zajac, 1990) is that of Miles and Snow (1978, 1994) which offers three ideal types of business strategy: 1) Defender (focused primarily on cost efficiency); 2) Prospector (focused primarily on innovation); and 3) Analyzer (focused primarily on quality).

In the globally competitive, technologically-advanced market where brain power and human resources are an organizations greatest asset (Thurow, 1997), HRD is increasingly expected to link their programs with the business strategy of the firm. Combining strategy and human resource development activities has become a vital source of competitiveness for all organizations (Ulrich, 1998). Rather than promote a dichotomy between business strategy and the development of individuals, products, or services, organizations must integrate these activities to create a sustainable competitive advantage (Seibert, Hall, & Kram, 1995).

Empirical research has shown support for a contingency perspective of strategic HR practices suggesting that the linear implications of a universal, or "best practices," perspective are too simplistic and that effective HR practices are actually contingent upon the business strategy of the firm. Several conceptual models have been introduced that address the human resource function in contingent relation to business strategy and other organizational characteristics. One such model is provided by Beer, Eisenstat, and Biggadike (1995) which provides a diagnostic model of organizational alignment and adaptability.

Theoretical Perspective

The theoretical perspective underlying this study falls within economic theory, specifically human capital theory. Several authors have addressed economic theory as it relates to business strategy, functional business units, and/or human resource development (Delaney, 1996; Jackson, Schuler, & Rivero, 1989; Weinberger, 1998). From micro economics, human capital theory suggests that people possess the knowledge, skills, and abilities that provide economic value to firms (Miles & Snow, 1995; Weinberger, 1998; Youndt, Snell, Dean, and Lepak, 1996).

An investment in human capital is a source of sustainable competitive advantage for firms (Thurow, 1997) and effective management of human capital, not physical capital, may be the ultimate determinant of organizational performance (Reich, 1991). Assuming heterogeneity among firms with respect to their human capital, competitive advantage is possible if a firm insures that its people add value to its production processes and that its pool of human capital is a unique resource, both difficult to replicate and difficult to substitute (Huselid, Jackson, and Schuler, 1997). Specifically, Huselid et al. state that firms can use training to insure the unique skills needed in their human capital to be competitive.

Copyright ©1999 Erica D. Kalata & Tim L. Wentling,

Traditionally, HRD has been seen as an expense rather than an investment, but as human capital becomes more valuable economically and natural resources less important (Thurow, 1997), HRD has increased pressure to show its value to the organization. The problem with most common types of HRD programs is that they are seen as solutions in and of themselves, rather than as parts of an overall system to support the business strategy (Cocheu, 1992). Often, it seems HRD programs are implemented with little intentional consideration for the competitive strategy of the organization making it difficult to show the value of the programs as investments in the future success of the firm.

With little empirical evidence on the nature of the relationship between competitive strategy and HRD practices, organizations have little guidance on HRD practices that will likely support their business strategy, increase the value of their human capital, and provide a source of sustainable competitive advantage. This study took a necessary step in beginning to understand this relationship.

The purpose of this study was to identify if a significant relationship exists between business strategy and HRD practices. The variables used to measure HRD activity were primarily based on McLagan's (1996) definition of HRD and were chosen because they provide a broad overview of the HRD function. The following research questions guided the study:

1. What is the relationship between business strategy type and the extent of emphasis on various types of training?
2. What is the relationship between business strategy type and the extent of emphasis on various job categories (e.g. executive) of recipients of training?
3. What is the relationship between business strategy type and the amount of training required by the company (e.g. Motorola's 40-hr training requirement)?
4. What is the relationship between business strategy type and the types of organization development (OD) interventions?
5. What is the relationship between business strategy type and the extent of emphasis on various levels of organization development (OD) interventions?
6. What is the relationship between business strategy type and HRD dollars per employee?
7. What is the overall relationship between business strategy and the HRD function?

Method

Research Design

A multiple method descriptive design that was primarily quantitative and correlational in nature was used in this study. The sample for the study was 52 companies from the 1998 Fortune 500 listing of the 500 largest U.S. companies by annual revenue. Instrumentation included a mail questionnaire (with a fax and e-mail version) and a telephone interview guide. A survey was the major method of data collection used by the researcher with an amalgamation of mail questionnaire and phone interview.

Data analysis included basic descriptive statistics, analysis of variance, discriminant function analysis, and content analysis. The statistical analyses was used to identify significant relationships while content analysis was used to identify themes that supported or added to findings from statistical analysis for a more complete description of these relationships.

Population and Sample

The population for this study was all 1998 Fortune 500 companies. This population was chosen because they represent the largest organizations in the U.S. for a broad base to gather a representative sample of the business strategy types in Miles and Snow's typology. This population also consisted of companies that were performing well and were large enough to have substantive HR departments with an active HRD function to provide rich, descriptive data necessary to identify significant relationships between business strategy and HRD.

A purposive sampling technique was used to establish a sampling frame of 178 companies. Because it was essential to this study to have a representative portion of the sample identified within each strategy type, an expert panel was used to establish the sampling frame. Ninety companies were contacted by phone and 52 were willing to participate in the study. Of the 52 that were willing to participate, 18 were defenders, 16 were analyzers, and 18 were prospectors. This sample assured that at least 15 companies were represented in each strategy type which was necessary to meet minimum requirements of the statistical analyses.

Twenty different industries were represented in the study, and no specific industry comprised more than fifteen percent of the total sample. The industries represented were: 1) aerospace, 2) auto, 3) banking, 4) chemicals, 5) consumer products & services, 6) durables, 7) electronics, 8) energy, 9) financial, 10) food & beverage, 11) health, 12) insurance, 13) materials & construction, 14) media, 15) mining & metals, 16) retailers, 17) technology, 18) telecommunications, 19) travel & transportation, and 20) utilities. The food & beverage industry comprised fifteen percent of the total sample, retailers comprised twelve percent of the total sample, and energy and technology each comprised approximately ten percent of the total sample. All of the companies had more than 3,500 employees with a range of 3,500 to 850,000 employees. Annual revenue ranged from approximately $3 billion to $120 billion while annual profit ranged from approximately $2 million to $3.8 billion.

No industry comprised more than twenty-two percent of companies in any business strategy subgroup. Companies in the retail industry comprised twenty-two percent of defenders, while companies in the technology industry comprised twenty-two percent of prospectors. Analyzers did not have a notable percentage of companies in any one industry. Average breakdowns by business strategy subgroup are provided in Table 1.

Table 1
Description of Sample by Business Strategy Subgroup

	n	Avg. Fortune 500 Rank	Avg. Annual Revenue ($ in millions)	Avg. # of Employees	Avg. Annual Profit ($ in millions)
Defender	18	142	20,893	114,947	967
Analyzer	16	145	15,107	79,376	519
Prospector	18	135	13,705	36,044	1,535

Instrumentation

Two primary instruments were used in this study: 1) a mail questionnaire; and 2) a telephone interview guide. The mail questionnaire was designed to record quantitative data focusing first on general department information, then information related specifically to training, next OD information, then overall HRD and business strategy information. This questionnaire was available in fax, e-mail, and regular mail forms, although participants only requested fax and e-mail versions. The questionnaire was designed to take 10-15 minutes to complete and included close-ended questions and requests for numerical data.

The telephone interview guide was designed in two sections. The first section was designed to introduce the study, while the second section was designed to guide follow up questions after completion of the questionnaire to solicit primarily qualitative information through open-ended questions. The interview was also designed to take 10-15 minutes and included a code number corresponding with the mail questionnaire code. Both instruments were pilot tested with 3 companies similar to those in the final sample.

Data Collection

The major method of data collection in this study was a survey, including an amalgamation of a mail questionnaire and phone interview. Data collection took place from July 15, 1998 through November 20, 1998.

The researcher located HRD manager contact information from either the ASTD, ISPI, AHRD, or SHRM membership directories. HRD managers were considered managers or directors of corporate departments such as training and development, corporate education, and performance development. These managers were in a position in which they were both aware of the business strategy of the company and also had oversight of company HRD practices, thus were able to provide accurate information regarding both variables.

Data collection began by contacting the HRD managers by phone, then explaining the purpose of the study, why and how they were selected, the limited time commitment involved, and asked for their participation in the study. Upon agreement to participate, the researcher either faxed or e-mailed the questionnaire directly to the participant with a note attached indicating the agreed upon date and time for the follow up interview. After the participant's answers were recorded on the questionnaire and contact was made for the follow up interview, the researcher then proceeded to ask the questions on the interview guide over the phone while recording the participant's answers on the interview guide. If the participant or researcher deemed it necessary to gather information from another source, the researcher gathered contact information for that source, repeated the process, then combined the data.

Data Analysis

Data analysis included the use of basic descriptive statistics, analysis of variance (ANOVA), discriminant function, and content analysis. Basic descriptive statistics were used to provide a profile of each strategy type and its corresponding aggregate measures across the HRD variables. The researcher then used one-way ANOVA with a Scheffe post hoc multiple comparison analysis to determine whether the business strategy types differed significantly among themselves on the HRD variables being studied.

Discriminant function analysis was then used to determine if the HRD variables found significantly related to business strategy type in the ANOVA could reasonably predict membership in either the defender, analyzer, or prospector business strategy type. Sapsford & Jupp (1996) report that social scientists see discriminant function analysis as a very useful analytical tool because it can be used both to predict the group to which a person or 'case' might belong on the basis of a set of characteristics which that person or case holds, and to identify which variables are most powerful in distinguishing between the members of different groups.

In addition to statistical analysis, the researcher used content analysis to determine if themes arose from the qualitative data that supported and/or enhanced the statistical analysis. Answers to the follow up interview were systematically reviewed for common themes within each business strategy type. These themes as well as frequency of answers were recorded in a combined spreadsheet set up with the questions listed on the Y-axis and business strategy types listed across the X-axis. This spreadsheet was used for comparison of themes across business strategy types. The statistical analysis and content analysis combined to provide concise, descriptive findings.

Findings

Overall, findings indicate that significant relationships do exist between business strategy types and certain HRD activities. The research questions are combined into three sections and addressed below (also see Table 2).

Relationship Between Business Strategy Type and the Extent of Emphasis on Training

Types of training. Respondents were asked what percentage of overall departmental training was allocated to various types of training over the past year. Results indicated that percent of training time allocated to management/supervisory training, percent of training time allocated to team training, and percent of training time allocated to customer service training showed significant between-group variances at $p<.15$. An expert statistician and the researcher deemed this p-value appropriate to use as a cut off mark for inclusion in the discriminant function analysis because of the overall sample and subgroup sample sizes. All respondents from the defender, analyzer, and prospector strategy types reported that their training does support the overall business strategy.

Job categories of training recipients. Respondents were asked what percentage of overall departmental training time was allocated to various job categories over the past year. Results indicated that the percent of training allocated to line workers, middle managers, and professionals had significant between-group variances.

Training required by company. Few companies reported having a minimum amount of annual training required for all employees. Only four defenders (range = 16 to 50 hrs.), two analyzers (range = 1 to 40 hrs.), and three prospectors (range = 50 to 80 hrs.) reported having a minimum amount of annual training for all employees.

Relationship Between Business Strategy Type and the Extent of Emphasis on OD

Types of OD interventions. Respondents were asked what percentage of overall departmental time was allocated to various types of OD interventions over the past year. Results indicated that time allocated to strategic OD interventions showed significant between-group variances. When asked to describe a significant OD intervention implemented over the past year, defenders (62%) described human resource-related interventions, analyzers (58%) described strategic OD interventions, and prospectors (56%) described HR process interventions.

Level of OD interventions. Respondents were also asked to indicate the percentage of overall departmental OD interventions allocated to various organization levels. Results did not indicate a statistically significant between-group variance. However, defenders (47%) reported having more success and increases at the individual level, analyzers (40%) reported the same at the organizational level, and prospectors (55%) at the group or team level.

Overall Relationship Between Business Strategy and the HRD Function

HRD dollars per employee. Results indicated that HRD dollars per employee showed a significant between-group variance. Results also indicated that prospectors have significantly more HRD dollars per employee than

defenders and analyzers. Defenders (67%), analyzers (53%), and prospectors (67%) said the HRD budget has increased over the past five years.

Overall HRD. Respondents were asked to indicate the percentage of overall departmental resources that were devoted to three major components of HRD (i.e. Training, OD, and CD) over the past year. Results did not indicate a statistically significant between-group variance. However, when asked how these percentages have changed over the past five years, defenders (63%), analyzers (57%), and prospectors (50%) said that OD had increased. Defenders (44%) also said that CD had increased. Defenders, analyzers, and prospectors all reported that the business strategy of their company has a large impact on the HRD function.

Discriminant Function Analysis. The eight variables found to be significantly different across the business strategy types were HRD dollars per employee, time spent on management training, time spent on team training, time spent on customer service training, training allocated to line workers, training allocated to middle managers, training allocated to professionals, and time spent on strategic OD interventions. Of these variables, HRD dollars per employee, time spent on team training, and time spent on strategic OD interventions showed the strongest relationship to business strategy type (see Table 2).

Discriminant function analysis was used to determine if this collective set of variables could predict membership in the three different business strategy types. The overall predictive capability of these variables was 69 percent, showing that using these variables to predict business strategy type membership would presumably double the likelihood of correct placement. The strongest predictive capability was for placement of defenders (77%), slightly less with prospectors (69%) and analyzers (62%). Table 3 presents an overview of major findings.

Table 2
Variable Pooled Means, Pooled Standard Deviations, Means by Group, Standard Deviations by Group, and Between-Group P-values

	Pooled means (s.d.)	Defender means (s.d.)	Analyzer means (s.d.)	Prospector means (s.d.)	Between-group p-value
HRD Dollars per Employee	507.18 (890.9)	210.08^{B} (249.20)	364.00^{B} (358.20)	947.46^{A} (1480.10)	.042**
Management Training	29.679 (15.75)	30.692 (15.96)	36.231 (16.85)	22.115 (14.36)	.065*

Table 3
Major Findings by Business Strategy Type

Defenders	Analyzers	Prospectors
-fewest HRD dollars/employee	-moderate HRD dollars/employee	-most HRD dollars/employee
-emphasis on management/supervisory and job/specific technical training and customer service training	-emphasis on management/supervisory and job specific technical training	-emphasis on job specific technical training and team training
-emphasis on line workers	-emphasis on middle managers	-emphasis on professionals
-emphasis on HR type intervention	-emphasis on strategic type OD interventions	-emphasis on HR process type interventions
-increase in HR process type interventions	-increase in strategic and organization structure type interventions	-increase in HR process and technology type interventions
-emphasis at the individual level	-emphasis at the organizational level	-emphasis at the group or team level
-increase in OD and CD	-increase in OD	-increase in OD

Discussion

Extent of Emphasis on Training

With a focus on high growth, intense market penetration, increased production, and cost efficiency, defenders seem to place a greater emphasis on management/supervisory training, customer service training, and training for line workers. These findings are consistent with Schuler and Jackson's (1987) report that defender types have a high need for promotion from within and a high degree of concern for quantity of output, which would likely increase supervisory training and training for line workers who are closest to the customer and to the production of that output.

Unlike defenders, analyzers have a stronger focus on process adaptation, high quality products and services, and advanced engineering and manufacturing skills to make new products or services better. Results of this study indicate that analyzers emphasize management/supervisory training and training for middle managers. These results are also consistent with Schuler and Jackson's finding that analyzer types have high levels of employee participation, which would likely increase training for middle managers who must assume new skills in coaching and encouraging employee participation rather than a more traditional role of control and command. Middle managers must also oversee the processes implemented to create high quality products and services.

Prospectors have a broad, changing product line focused on product innovation and market responsiveness in order to be 'first in' to new markets. Findings show that prospectors place a greater emphasis on job specific technical training, team training, and training for professionals. Schuler and Jackson (1987) found that prospector types require a high level of cooperative, interdependent activity and rely on a high degree of creative behavior in order to continually create new innovations. Thus, it appears likely that prospectors have a larger percentage of professional positions that require technical skills and a great deal of communication between teams to remain competitive by have the most innovative products or services first in the market.

Extent of Emphasis on Organization Development

Findings indicate that defenders place a greater emphasis on human resource type OD interventions such as setting goals and performance appraisals as well as an emphasis on individual level OD interventions. These findings are related to findings by Youndt et al. who report that defender types focused more HRD administrative tasks such as policies and procedures rather than more comprehensive level HRD issues. The findings are also consistent with Schuler and Jackson's (1987) report that defender types focus more on individual activity and have a shorter term focus when compared to other business strategy types. Defenders also appear to have seen an increase

in HR process type interventions, which is related to Fiedler, Teng, and Grover's (1995) finding that defender types are using more business process and redesign (BPR) focused on interfunctional processes.

Analyzers seem to place a greater emphasis on strategic type interventions such as analyzing what products/services to provide and how to transform the environment, and an emphasis on organization level interventions. This finding appears to be related to Schuler and Jackson (1987) finding that analyzer types were found to have a longer term focus and higher commitment to the goals of the organization when compared to the other types of training. This may be due in part to the high degree of total quality management initiatives that seem to have impacted the implementation of the analyzer business strategy. Total quality management philosophy requires that all levels of employees actively participate, and that each job has an explicit connection to the goals of the organization.

In addition, it appears that prospectors place a greater emphasis on HR process type interventions and group or team level interventions. This finding seems directly related to findings by Schuler and Jackson (1987) that indicate prospector types require a high level of cooperative, interdependent activity associated with work that requires close interaction and coordination between people. Prospectors also appear to have seen an increase in HR process and technology type interventions, which is consistent in part with Chaya's (1995) finding that a strong relationship exists between high information technology spending and differentiation through innovation.

Overall Relationship Between Business Strategy and the HRD Function

The data indicate that out of the three business strategy types, defenders have the fewest HRD dollars per employee, analyzers have more HRD dollars per employee than defenders but less than prospectors, and prospectors have the most HRD dollars per employee. Several findings from previous research are consistent with these findings. For instance, Jackson et al. (1989) found that defender types have fewer hours of training than other business strategy types and Schuler and Jackson (1987) found that defender types have minimal levels of employee training and development. Jackson et al. (1989) found that prospector types have more total hours of training and a greater percentage of employees received training than in other business strategy types. Torraco and Swanson (1995) state that knowledge drives product innovation and employees are carriers of that knowledge. Perhaps prospectors have grasped this concept and applied it to achieve their business strategy focused on innovation.

It appears that a strong relationship exists between certain HRD practices and business strategy. The following eight HRD practices seem to have the strongest relationship to business strategy: 1) HRD dollars per employee, 2) percentage of training time allocated to management training, 3) percentage of training time allocated to team training, 4) percentage of training time allocated to customer service training, 5) percentage of training allocated to line workers, 6) percentage of training allocated to middle managers, 7) percentage of training allocated to professionals, and 8) percentage of time spent on strategic OD interventions.

Contrary to much of the literature that presents "best practices" in HRD, findings from this study indicate that the best or most effective HRD practices are not necessarily universal across all companies, but rather seem strongly dependent on the chosen business strategy of the firm.

Significance of the Study

This study provides information to businesses and HRD professionals alike on the current status of the relationship between organizational business strategy and the HRD function. By doing so, the study provides current information to organizations with similar business strategies on the linkages that exist between business strategy and the HRD function. The study also provides companies attempting to change their business strategy with information on how they might position their HRD function to achieve their goal.

The results show how some of the top U.S. companies are positioning their HRD resources to provide the knowledge and skills necessary to gain or maintain a sustainable competitive advantage in relation to their chosen business strategy. In addition, this study provides HRD practitioners with insight on types of programs, money spent on programs, and the level of programs that companies in different business strategy groups are using to develop their employees. The results of this study help organizations and the HRD function, specifically, understand how business strategy and the HRD function relate within the overall system. HRD professionals should be better able to understand, justify, and improve the nature of their function in relation to the competitive position of their organization through the relationships found in this study, thus making a necessary step towards developing human capital in a way that truly advances the competitiveness of the organization.

Conflicts That Arise in Small Group Facilitation: A Descriptive Study of Accounts, Actions, Outcomes, and Assessments

Judith A. Kolb
William J. Rothwell
Pennsylvania State University

The purpose of this article is to report and discuss the types of conflicts that arise in small group facilitation. Data were taken from self-report accounts contributed by facilitators who are members of the International Society for Performance Improvement. Verbatim accounts of conflict situations are cited, relevant literature on small group conflict is reviewed and discussed, and suggestions for future research are offered.

Keywords: Facilitation, Teams, Conflict

With today's organizational emphasis on teamwork, there is an increasing interest in and need for small group facilitation. There is little understanding, however, of what facilitation is or what facilitators actually do. Frey (1994, p. 4) offers this definition of facilitation, "any meeting technique, procedure, or practice that makes it easier for groups to interact and/or accomplish their goals." Meeting procedures are defined by Poole (1991, p. 55) as, "set of rules or guidelines which specify how a group should organize its process to achieve a particular goal." Thus, small group facilitators are individuals who help group members improve group process in order to expedite goal accomplishment. To improve group process, the facilitator needs to have an understanding of how groups operate.

The dual needs of small groups were first recognized by Bales (1950) who labeled the two needs task and social-emotional. Schein in 1979 and later in 1987 applied Bales' work to human relations training and process consultation. He specified that task or content is the work that is to be done by the group. Task process focuses on ways of getting the job done. This includes such things as setting an agenda, the use of decision-making and/or problem-solving techniques, and time management. Maintenance process focuses on ways of getting the group's psychosocial needs met and the development of satisfying relationships among group members. Maintenance includes such things as levels of participation, power issues, dealing with dysfunctional members, and setting appropriate norms of behavior. Almost fifty years after Bales' work, task and maintenance functions still are recognized as central to group functioning. Reddy (1994) suggests the following questions be asked by the facilitator: "Is the group operating effectively? Is the group running efficiently? Are members satisfied with what they are doing and how they are doing it?" (p. 29).

A wide body of academic literature on small groups exists. For a review of recent studies, see Bettenhausen (1991). This literature is rife with research on the efficacy of a variety of decision-making techniques (e.g., brainstorming, Delphi, nominal group). Many of these studies were conducted on student samples in laboratory settings (see, for example, Burleson, Levine, & Samter, 1984; Hirokawa, 1985; Jablin, 1981; Jarboe, 1988, Miner, 1984). More recent attention has turned to the study of small groups or teams in organizations (e.g., Ancona, 1990; Brooks, 1994; Gersick, 1988; Glaser, 1994; Hackman, 1990; Hirokawa & Keyton, 1995; Jackson, May, & Whitney, 1995; Kolb, 1995; Larkey, 1996; Larson & LaFasto, 1989; Seers, Petty, & Cashman, 1995; Stevens, 1994). Conflict in small groups has been the focus of numerous research studies (e.g., Appelbaum, 1992; Coman, 1996; Hall & Wallace, 1996; Kirchmeyer & Cohen, 1992; Kochery, 1993; McRoy, 1996; Pace, 1990; Pelled, 1996; Pelled & Adler, 1994; Rybak, 1997; Valacich & Schwenk, 1995).

The study reported here adds to the literature by describing what facilitators actually do to handle conflict situations that arise in facilitated organizational groups. Accounts of facilitation challenges and/or problems were collected from facilitators as part of a larger study designed to analyze the behaviors and competencies of small group facilitators in organizations. Since the number one challenge or problem reported by respondents was handling conflict, the focus of this article is an analysis and discussion of the types of conflicts that occur in small groups, how facilitators handle these conflicts, the results of their efforts, and how facilitators would change or not change the way they handle similar conflicts in the future.

Research Questions

RQ1: What types of conflict situations were described as challenging and/or problematic by small group facilitators?

RQ2: How were these conflict situations handled by facilitators and what happened as a result of the facilitators' actions?

Methodology

Sample

Letters and questionnaires were mailed to 304 members of the International Society for Performance Improvement requesting their participation in a small group facilitation study. Sixty-three individuals who indicated that they facilitated small groups participated in the study. Of these, 68 percent described themselves as human resource development professionals; the remainder listed a variety of job titles, such as industrial psychologist, program development specialist, training and development manager, performance technologist, instructional designer, and teacher.

Three-fourths of the participants worked in the following industries: manufacturing, 19%; transportation / communication / utilities, 14%; government / armed services, 11%; finance / insurance / real estate, 10%; and other services, 21%. The remainder came from a variety of industry categories. Industry size breakdowns were as follows: below 100 employees, 24%; 100 - 499, 7%; 500 - 1999, 19%; 2000 - 4999, 10%; 5000 - 9999, 11%; 10,000 and above, 29%.

Procedure

Participants furnished demographic information and responded to the following four-part question:

If you have facilitated small groups, answer the following questions:

A. What was the most difficult small group facilitation challenge or problem you have ever faced? (Describe situation. Do not list names of individuals, though you may list job titles.)
B. What did you do? (Explain.)
C. What happened as a result of what you did? (Describe the consequences of your actions.)
D. If you were faced with exactly the same problem again, how would you handle it? Why would you handle it that way?

Eight participants either left the question blank or wrote illegible responses. The remaining fifty five responses were coded using thematic analytic methods of transcription--looking for "recurring regularities" in the data, and sorting the regularities into categories that "dovetail in a meaningful way" (Patton, 1980, p. 311). The following decision rules were adopted for the coding: (1) the entire response (A - D) would be the unit of analysis, (2) each response would be coded under only one primary theme, 3) in the case of two of more issues running throughout the response, the facilitator's response to Item D would be used to decide on the primary theme. All situations were able to be coded using this procedure. Issues mentioned in the responses, but not identified as primary themes, were coded for further analysis and noted for discussion purposes. The responses coded under the two primary themes of Internal Conflict and Dysfunction/disruptive group member(s) are the ones reported and discussed in this paper.

Results

In this section, a description is given for each of the two themes, followed by four verbatim transcripts of responses coded under that theme, and a brief summary section. Relevant issues stemming from the examples are discussed in the following section.

Internal Conflict

This code was used for situations in which disagreements and/or discord among group members appeared to be the primary issue. The conflict could be issue- or relationship-based; however, it needed to concern all or most group members and be relevant to the project at hand. Quarrels between just two individuals that were not described as being relevant to the entire group were coded elsewhere (under Dysfunctional/Disruptive Group Members).

Example 1:

A. Groups who need to work together but do not want to because they have issues or problems w/other group members
B. Press the group on what they want together. Determine if there is a goal they all think is important
C. They decided they cared more about the longer range goal than short term conflicts

1. I would spend more time w/ each group member individually before convening the larger group, helping them be clear about their personal goals & shared goals

Example 2:

A. Re: Planning diversity training. Negative attitudes about the subject expressed by 1/2 of group. Belief that we could not & should not undertake this project. All staff members: 3 female, 3 male; Positive side 2 female, 1 male; negative side 2 males, 1 female. The positive and negatives began to argue.
B. Called for a short break – When mtg. resumed recapped situation, "I hear that you have some concerns . . ." – Asked several questions to clarify what the real issue was-discovered that the negative members are left brained & needed more information.

1. Both sides have a better understanding of the needs of the other group – Provided more info, reassured group of my confidence in their abilities – Brought in other trainers to provide skill based instruction in the areas of concern-(i.e. conflict management & facilitation)
2. I would ask for more information-I would ask what information/resources I could provide – I tend to try to solve problems before I know the root cause. – I believe if I ask questions & let the group talk I will more likely be able to steer the group to a win-win. BFR, I would start talking & counseling.

Example 3:

A. Dealing with disputing factions

1. Clarified the perspectives of the different parties. Then asked the whole group what direction they wanted to pursue and guided them to some resolution
2. There was agreement to disagree on some of the fine points of their dispute and consensus on continuing the process to develop something that would satisfy everyone
3. About the same thing, but I might stay out of the process even more

Example 4:

A. Dealing with conflict among team members
B. Helped focus group on conflict to try to get an openness; handled individual conflicts outside of the group where necessary by getting individuals to talk w/ each other

1. Got some agreement but not all from different participants
2. Force individuals to face issues earlier. Things lingered too long.

Summary

Under the theme of Internal Conflict, the facilitators helped the groups do the following: clarify issues, focus on goals and identify common areas of interest, and participate in a full discussion. Additional issues raised by these examples include: (1) under what conditions do facilitators meet privately with individuals? and (2) what is the facilitator's role in dealing with a group's lack of information on the issues?

Dysfunctional/disruptive Group Member(s)

In contrast to the first identified theme, Internal Conflict, situations under this code involved either one or two dysfunctional/disruptive individuals whose behavior was detrimental to the group. When the situation involved two individuals, the argument appeared to go beyond what would be expected of two colleagues disagreeing on a work-related matter.

Example 1:

A. A very disruptive person stated their issue (which was off the topic) and would not move on.
B. Put on an issue chart/parking lot. And forced the issue to the side. The person would not quit venting.
C. Review with the person & the V.P. they report to.

- Same way-would intervene even more quickly

Example 2:

A. A very junior member of the team with no trust in the process – Used "they" all the time.
B. Tried to keep group focused on the problem & process – I got sucked in by getting irritated at the person (oldest error in the book!)

- Individual dropped off the team due to pressure from other team members who were equally irritated.
- Next time: Establish ground rule up front to – only speak for yourself – avoid using "they"-use data

Example 3:

A. Overt arguments between participants. Two people hotly disagreed on a subject. One left the room and refused to come back.
B. Immediately had the group take a break. Talked to both people separately, then together.
C. They reached an "operating agreement" to be civil during the group sessions.
D. Try to step in earlier to prevent what happened. The group got nervous & then gossip started on the breaks

Example 4:

A. Open conflict between group participants
B. Moved toward a break in group session, then confronted the problem in a private setting with individuals involved to resolve the conflict or terminate their participation.
C. Conflict was eliminate in the session but further private session were need to solve the problem.
D. I would handle it the same way with a similar group size. (more than 10 participants). I believe it is counter productive to involve all participants in conflict resolution. If they were not a party before hand.

Summary

In dealing with dysfunctional and/or disruptive member(s), facilitators attempted to refocus; two talked to disruptive individuals privately during break time. All seemed to agree that immediate steps were necessary before behavior negatively affected the group. One issue raised is the same as was previously identified under the theme of Internal Conflict: (1) at what point do you talk to individuals privately? Additional issues are: (2) at what point do you talk to a group member's boss, and what are the ethical considerations related to this? and (3) how does the facilitator's reaction to conflict (e.g., the facilitator becoming irritated in Example 2) affect the group?

Discussion

Participants in this study were asked to focus on "the most difficult small group facilitation challenge or problem you have ever faced." In this context, issues related to dealing with conflict emerged as the number one challenge and/or problem cited by small group facilitators. If the Dysfunctional/disruptive Group Member(s) and Internal

Conflict categories are combined (since both deal with conflict in one form or another), 36 percent of the incidents described by participants in this study were related to conflict. Before concluding that conflict is rampant in facilitated groups, however, it is important to note the small size of this sample and the wording of the study questions.

Although the word "conflict" often has a negative connotation, disagreement among group members can improve a group's decision-making. Janis's (1983) often-cited work on groupthink found that highly cohesive groups suspend critical thinking and adopt proposed solutions too quickly. Schwarz (1994) states, "How a group manages conflict will affect its ability to solve problems, be creative, and to integrate the different interests of group members with the demands placed on the group" (p. 24).

Before deciding that a conflict is "good" or "bad" then, it is necessary to look at the nature of the conflict. Sources of small group conflicts have been classified as substantive, procedural, and affective (Putnam, 1986). Substantive conflicts involve disagreements over members' ideas and group issues. Procedural conflict is disagreement among group members about the methods of process that should be followed by the group in accomplishing a goal. Affective conflicts involve people's feelings and the way members relate to each other.

Substantive/Procedural Conflicts
